98. The acquirer shall classify an obligation to pay contingent consideration that meets the definition of a financial instrument as a financial liability or as a component of net assets/equity on the basis of the definitions of an equity instrument and a financial liability in paragraph 9 of IPSAS 28. The acquirer shall classify as an asset a right to the return of previously transferred consideration if specified conditions are met. Paragraph 117 provides guidance on the subsequent accounting for contingent consideration.

An Acquisition Achieved in Stages

99. An acquirer sometimes obtains control of an acquired operation in which it held an equity interest immediately before the acquisition date. For example, on 31 December 20X1, Entity A holds a 35 percent non-controlling equity interest in Entity B. On that date, Entity A purchases an additional 40 percent interest in Entity B, which gives it control of Entity B. This Standard refers to such a transaction as an acquisition achieved in stages, sometimes also referred to as a step acquisition.

100. In an acquisition achieved in stages, the acquirer shall remeasure its previously held equity interest in the acquired operation at its acquisition-date fair value and recognize the resulting gain or loss, if any, in surplus or deficit or in net assets/equity, as appropriate. In prior reporting periods, the acquirer may have recognized changes in the value of its equity interest in the acquired operation in net assets/equity. If so, the amount that was recognized in net assets/equity shall be recognized on the same basis as would be required if the acquirer had disposed directly of the previously held equity interest.

100A. When a party to a joint arrangement (as defined in IPSAS 37, *Joint Arrangements*) obtains control of an operation that is a joint operation (as defined in IPSAS 37), and had rights to the assets and obligations for the liabilities relating to that joint operation immediately before the acquisition date, the transaction is an acquisition achieved in stages. The acquirer shall therefore apply the requirements for an acquisition achieved in stages, including remeasuring its previously held interest in the joint operation in the manner described in paragraph 100. In doing so, the acquirer shall remeasure its entire previously held interest in the joint operation.

Additional Guidance for Applying the Acquisition Method Where an Acquisition is Achieved Through Changes in Voting Rights, by Contract Alone, and Similar Circumstances in Which no Consideration is Transferred

An Acquisition Achieved Through Changes in Voting Rights, by Contract Alone, and Similar Circumstances not Involving the Transfer of Consideration

101. An acquirer sometimes obtains control of an acquired operation without transferring consideration. The acquisition method of accounting for an acquisition applies to those public sector combinations. Such circumstances include:

(a) The acquired operation repurchases a sufficient number of its own shares for an existing investor (the acquirer) to obtain control.

(b) Minority veto rights lapse that previously kept the acquirer from controlling an acquired operation in which the acquirer held the majority voting rights.

(c) The acquirer and acquired operation agree to combine their operations by contract alone. The acquirer transfers no consideration in exchange for control of an acquired operation and holds no quantifiable ownership interests in the acquired operation, either on the acquisition date or previously.

102. In an acquisition achieved by contract alone, the acquirer shall attribute to the owners of the acquired operation the amount of the acquired operation's net assets recognized in accordance with this Standard. In other words, the quantifiable ownership interests in the acquired operation held by parties other than the acquirer are a non-controlling interest in the acquirer's post-combination financial statements even if the result is that all of the quantifiable ownership interests in the acquired operation are attributed to the non-controlling interest.

Measurement Period

103. **If the initial accounting for an acquisition is incomplete by the end of the reporting period in which the acquisition occurs, the acquirer shall report in its financial statements provisional amounts for the items for which the accounting is incomplete. During the measurement period, the acquirer shall retrospectively adjust the provisional amounts recognized at the acquisition date to reflect new information obtained about facts and circumstances that existed as of the acquisition date and, if known, would have affected the measurement of the amounts recognized as of that date. During the measurement period, the acquirer shall also recognize additional assets or liabilities if new information is obtained about facts and circumstances that existed as of the acquisition date and, if**

known, would have resulted in the recognition of those assets and liabilities as of that date. The measurement period ends as soon as the acquirer receives the information it was seeking about facts and circumstances that existed as of the acquisition date or learns that more information is not obtainable. However, the measurement period shall not exceed one year from the acquisition date.

104. The measurement period is the period after the acquisition date during which the acquirer may adjust the provisional amounts recognized for an acquisition. The measurement period provides the acquirer with a reasonable time to obtain the information necessary to identify and measure the following as of the acquisition date in accordance with the requirements of this Standard:

(a) The identifiable assets acquired, liabilities assumed and any non-controlling interest in the acquired operation;

(b) The consideration transferred for the acquired operation (or the other amount used in measuring goodwill);

(c) In an acquisition achieved in stages, the equity interest in the acquired operation previously held by the acquirer; and

(d) The resulting goodwill, loss, or gain on a bargain purchase.

105. The acquirer shall consider all pertinent factors in determining whether information obtained after the acquisition date should result in an adjustment to the provisional amounts recognized or whether that information results from events that occurred after the acquisition date. Pertinent factors include the date when additional information is obtained and whether the acquirer can identify a reason for a change to provisional amounts. Information that is obtained shortly after the acquisition date is more likely to reflect circumstances that existed at the acquisition date than is information obtained several months later. For example, unless an intervening event that changed its fair value can be identified, the sale of an asset to a third party shortly after the acquisition date for an amount that differs significantly from its provisional fair value measured at that date is likely to indicate an error in the provisional amount.

106. The acquirer recognizes an increase (decrease) in the provisional amount recognized for an identifiable asset (liability) by means of a decrease (increase) in goodwill. However, new information obtained during the measurement period may sometimes result in an adjustment to the provisional amount of more than one asset or liability. For example, the acquirer might have assumed a liability to pay damages related to an accident in one of the acquired operation's facilities, part or all of which are covered by the acquired operation's liability insurance policy. If the acquirer obtains new information during the measurement period about the acquisition-date fair value of that liability, the adjustment to goodwill resulting from a change to the provisional amount recognized for the liability would be offset (in whole or in part) by a corresponding adjustment to goodwill resulting from a change to the provisional amount recognized for the claim receivable from the insurer.

107. During the measurement period, the acquirer shall recognize adjustments to the provisional amounts as if the accounting for the acquisition had been completed at the acquisition date. Thus, the acquirer shall revise comparative information for prior periods presented in financial statements as needed, including making any change in depreciation, amortization or other income effects recognized in completing the initial accounting.

108. After the measurement period ends, the acquirer shall revise the accounting for an acquisition only to correct an error in accordance with IPSAS 3.

Determining what is Part of the Acquisition Transaction

109. **The acquirer and the acquired operation may have a pre-existing relationship or other arrangement before negotiations for the acquisition began, or they may enter into an arrangement during the**

negotiations that is separate from the acquisition. In either situation, the acquirer shall identify any amounts that are not part of what the acquirer and the acquired operation (or its former owners) exchanged in the acquisition, i.e., amounts that are not part of the exchange for the acquired operation. The acquirer shall recognize as part of applying the acquisition method only the consideration transferred for the acquired operation and the assets acquired and liabilities assumed in the exchange for the acquired operation. Separate transactions shall be accounted for in accordance with the relevant IPSAS.

110. A transaction entered into by or on behalf of the acquirer or primarily for the benefit of the acquirer or the combined entity, rather than primarily for the benefit of the acquired operation (or its former owners) before the acquisition, is likely to be a separate transaction. The following are examples of separate transactions that are not to be included in applying the acquisition method:

(a) A transaction that in effect settles pre-existing relationships between the acquirer and acquired operation;

(b) A transaction that remunerates employees or former owners of the acquired operation for future services; and

(c) A transaction that reimburses the acquired operation or its former owners for paying the acquirer's acquisition-related costs.

Paragraphs AG99–AG106 provide related application guidance.

Acquisition-Related Costs

111. Acquisition-related costs are costs the acquirer incurs to effect an acquisition. Those costs include finder's fees; advisory, legal, accounting, valuation and other professional or consulting fees; general administrative costs, including the costs of maintaining an internal acquisitions department; and costs of registering and issuing debt and equity securities. The acquirer shall account for acquisition-related costs as expenses in the periods in which the costs are incurred and the services are received, with one exception. The costs to issue debt or equity securities shall be recognized in accordance with IPSAS 28 and IPSAS 41.

Subsequent Measurement and Accounting

112. **In general, an acquirer shall subsequently measure and account for assets acquired, liabilities assumed or incurred and equity instruments issued in an acquisition in accordance with other applicable IPSAS for those items, depending on their nature. However, this Standard provides guidance on subsequently measuring and accounting for the following assets acquired, liabilities assumed or incurred and equity instruments issued in an acquisition:**

(a) **Reacquired rights;**

(b) **Contingent liabilities recognized as of the acquisition date;**

(c) **Indemnification assets;**

(d) **Contingent consideration; and**

(e) **Income taxes (where not included in the terms of the acquisition).**

Paragraphs AG107–AG108 provide related application guidance.

Reacquired Rights

113. A reacquired right recognized as an intangible asset shall be amortized over the remaining period of the binding arrangement in which the right was granted, where the right was granted for a finite period. Where

the right was granted for an indefinite period, the resulting entity shall test the right for impairment at least annually, and whenever there is an indication that the right may be impaired. An acquirer that subsequently sells a reacquired right to a third party shall include the carrying amount of the intangible asset in determining the gain or loss on the sale.

Transfers, Concessionary Loans and Similar Benefits Received by an Acquirer or Acquired Operation on the Basis of Criteria that May Change as a Result of an Acquisition

114. A transfer, concessionary loan or similar benefit, previously received by an acquirer or an acquired operation on the basis of criteria that change as a result of an acquisition, shall be reassessed prospectively in accordance with other IPSAS (paragraphs AG109–AG111 provide related application guidance).

Contingent Liabilities

115. After initial recognition and until the liability is settled, cancelled or expires, the acquirer shall measure a contingent liability recognized in an acquisition at the higher of:

(a) The amount that would be recognized in accordance with IPSAS 19; and

(b) The amount initially recognized less, if appropriate, the cumulative amount of revenue recognized in accordance with IPSAS 47.

This requirement does not apply to contracts accounted for in accordance with IPSAS 41, *Financial Instruments*.

Indemnification Assets

116. At the end of each subsequent reporting period, the acquirer shall measure an indemnification asset that was recognized at the acquisition date on the same basis as the indemnified liability or asset, subject to any contractual limitations on its amount and, for an indemnification asset that is not subsequently measured at its fair value, management's assessment of the collectability of the indemnification asset. The acquirer shall derecognize the indemnification asset only when it collects the asset, sells it or otherwise loses the right to it.

Contingent Consideration

117. Some changes in the fair value of contingent consideration that the acquirer recognizes after the acquisition date may be the result of additional information that the acquirer obtained after that date about facts and circumstances that existed at the acquisition date. Such changes are measurement period adjustments in accordance with paragraphs 103–107. However, changes resulting from events after the acquisition date, such as meeting an earnings target, reaching a specified share price or reaching a milestone on a research and development project, are not measurement period adjustments. The acquirer shall account for changes in the fair value of contingent consideration that are not measurement period adjustments as follows:

(a) Contingent consideration classified as a component of net assets/equity shall not be remeasured and its subsequent settlement shall be accounted for within net assets/equity.

(b) Other contingent consideration that:

(i) Is within the scope of IPSAS 41 shall be measured at fair value at each reporting date and changes in fair value shall be recognized in surplus or deficit in accordance with IPSAS 41.

(ii) Is not within the scope of IPSAS 41 shall be measured at fair value at each reporting date and changes in fair value shall be recognized in surplus or deficit.

Income Taxes (Where not Included in the Terms of the Acquisition)

118. Acquisitions involving public sector entities may result in a tax authority forgiving amounts of tax subsequent to the acquisition. The acquirer shall account for the tax forgiven prospectively in accordance with the relevant international or national accounting standard dealing with income taxes.

Disclosures

119. **The acquirer shall disclose information that enables users of its financial statements to evaluate the nature and financial effect of an acquisition that occurs either:**

(a) **During the current reporting period; or**

(b) **After the end of the reporting period but before the financial statements are authorized for issue.**

120. To meet the objective in paragraph 119, the acquirer shall disclose the following information for each acquisition that occurs during the reporting period:

(a) The name and a description of the acquired operation.

(b) The acquisition date.

(c) The percentage of voting equity interests or equivalent acquired.

(d) The primary reasons for the acquisition and a description of how the acquirer obtained control of the acquired operation including, where applicable, the legal basis for the acquisition.

(e) A qualitative description of the factors that make up the goodwill recognized, such as expected synergies from combining the operations of the acquired operation and the acquirer, intangible assets that do not qualify for separate recognition or other factors.

(f) The acquisition-date fair value of the total consideration transferred and the acquisition-date fair value of each major class of consideration, such as:

(i) Cash;

(ii) Other tangible or intangible assets, including an operation or controlled entity of the acquirer;

(iii) Liabilities incurred, for example, a liability for contingent consideration; and

(iv) Equity interests of the acquirer, including the number of instruments or interests issued or issuable and the method of measuring the fair value of those instruments or interests.

(g) For contingent consideration arrangements and indemnification assets:

(i) The amount recognized as of the acquisition date;

(ii) A description of the arrangement and the basis for determining the amount of the payment; and

(iii) An estimate of the range of outcomes (undiscounted) or, if a range cannot be estimated, that fact and the reasons why a range cannot be estimated. If the maximum amount of the payment is unlimited, the acquirer shall disclose that fact.

(h) For acquired receivables:

(i) The fair value of the receivables;

(ii) The gross amounts receivable in accordance with a binding arrangement; and

(iii) The best estimate at the acquisition date of the cash flows in accordance with a binding arrangement not expected to be collected.

The disclosures shall be provided by major class of receivable, such as loans, leases and any other class of receivables.

(i) The amounts recognized as of the acquisition date for each major class of assets acquired and liabilities assumed.

(j) For each contingent liability recognized in accordance with paragraph 77, the information required in paragraph 98 of IPSAS 19. If a contingent liability is not recognized because its fair value cannot be measured reliably, the acquirer shall disclose:

  (i) The information required by paragraph 100 of IPSAS 19; and

  (ii) The reasons why the liability cannot be measured reliably.

(k) The total amount of goodwill that is expected to be deductible for tax purposes.

(l) For transactions that are recognized separately from the acquisition of assets and assumption of liabilities in the acquisition in accordance with paragraph 109:

  (i) A description of each transaction;

  (ii) How the acquirer accounted for each transaction;

  (iii) The amounts recognized for each transaction and the line item in the financial statements in which each amount is recognized; and

  (iv) If the transaction is the effective settlement of a pre-existing relationship, the method used to determine the settlement amount.

(m) The disclosure of separately recognized transactions required by (l) shall include the amount of acquisition-related costs and, separately, the amount of those costs recognized as an expense and the line item or items in the statement of financial performance in which those expenses are recognized. The amount of any issue costs not recognized as an expense and how they were recognized shall also be disclosed.

(n) In an acquisition in which a loss is recognized in surplus or deficit (see paragraph 86):

  (i) The amount of the loss recognized in accordance with paragraph 86 and the line item in the statement of financial performance in which the loss is recognized; and

  (ii) A description of the reasons why the transaction resulted in a loss.

(o) In a bargain purchase (see paragraphs 88–90):

  (i) The amount of any gain recognized in accordance with paragraph 88 and the line item in the statement of financial performance in which the gain is recognized; and

  (ii) A description of the reasons why the transaction resulted in a gain.

(p) For each acquisition in which the acquirer holds less than 100 percent of the quantifiable ownership interests or equivalent in the acquired operation at the acquisition date:

  (i) The amount of the non-controlling interest in the acquired operation recognized at the acquisition date and the measurement basis for that amount; and

  (ii) For each non-controlling interest in an acquired operation measured at fair value, the measurement technique(s) and significant inputs used to measure that value.

(q) In an acquisition achieved in stages:

(i) The acquisition-date fair value of the equity interest in the acquired operation held by the acquirer immediately before the acquisition date; and

(ii) The amount of any gain or loss recognized as a result of remeasuring to fair value the equity interest in the acquired operation held by the acquirer before the acquisition (see paragraph 100) and the line item in the statement of financial performance in which that gain or loss is recognized.

(r) The following information:

(i) The amounts of revenue and expense, and the surplus or deficit of the acquired operation since the acquisition date included in the consolidated statement of financial performance for the reporting period; and

(ii) The revenue and expense, and the surplus or deficit of the combined entity for the current reporting period as though the acquisition date for all acquisitions that occurred during the year had been as of the beginning of the annual reporting period.

If disclosure of any of the information required by this subparagraph is impracticable, the acquirer shall disclose that fact and explain why the disclosure is impracticable. This Standard uses the term 'impracticable' with the same meaning as in IPSAS 3.

121. For individually immaterial acquisitions occurring during the reporting period that are material collectively, the acquirer shall disclose in aggregate the information required by paragraph 120(e)–(r).

122. If the acquisition date of an acquisition is after the end of the reporting period but before the financial statements are authorized for issue, the acquirer shall disclose the information required by paragraph 120 unless the initial accounting for the acquisition is incomplete at the time the financial statements are authorized for issue. In that situation, the acquirer shall describe which disclosures could not be made and the reasons why they cannot be made.

123. **The acquirer shall disclose information that enables users of its financial statements to evaluate the financial effects of adjustments recognized in the current reporting period that relate to acquisitions that occurred in the period or previous reporting periods.**

124. To meet the objective in paragraph 123, the acquirer shall disclose the following information for each material acquisition or in the aggregate for individually immaterial acquisitions that are material collectively:

(a) If the initial accounting for an acquisition is incomplete (see paragraph 103) for particular assets, liabilities, non-controlling interests or items of consideration and the amounts recognized in the financial statements for the acquisition thus have been determined only provisionally:

(i) The reasons why the initial accounting for the acquisition is incomplete;

(ii) The assets, liabilities, quantifiable ownership interests (or equivalent) or items of consideration for which the initial accounting is incomplete; and

(iii) The nature and amount of any measurement period adjustments recognized during the reporting period in accordance with paragraph 107.

(b) For each reporting period after the acquisition date until the entity collects, sells or otherwise loses the right to a contingent consideration asset, or until the entity settles a contingent consideration liability or the liability is cancelled or expires:

(i) Any changes in the recognized amounts, including any differences arising upon settlement;

(ii) Any changes in the range of outcomes (undiscounted) and the reasons for those changes; and

(iii) The measurement techniques and key model inputs used to measure contingent consideration.

(c) For contingent liabilities recognized in an acquisition, the acquirer shall disclose the information required by paragraphs 97 and 98 of IPSAS 19 for each class of provision.

(d) A reconciliation of the carrying amount of goodwill at the beginning and end of the reporting period showing separately:

(i) The gross amount and accumulated impairment losses at the beginning of the reporting period.

(ii) Additional goodwill recognized during the reporting period, except goodwill included in a disposal group that, on acquisition, meets the criteria to be classified as held for sale in accordance with IPSAS 44.

(iii) Adjustments resulting from the subsequent recognition of amounts during the reporting period in accordance with the relevant international or national accounting standard dealing with income taxes.

(iv) Goodwill included in a disposal group classified as held for sale in accordance with IPSAS 44 and goodwill derecognized during the reporting period without having previously been included in a disposal group classified as held for sale.

(v) Impairment losses recognized during the reporting period in accordance with IPSAS 26, *Impairment of Cash-Generating Assets*. (IPSAS 26 requires disclosure of information about the recoverable amount and impairment of goodwill in addition to this requirement.)

(vi) Net exchange rate differences arising during the reporting period in accordance with IPSAS 4, *The Effects of Changes in Foreign Exchange Rates*.

(vii) Any other changes in the carrying amount during the reporting period.

(viii) The gross amount and accumulated impairment losses at the end of the reporting period.

(e) The amount and an explanation of any gain or loss recognized in the current reporting period that both:

(i) Relates to the identifiable assets acquired or liabilities assumed in an acquisition that was effected in the current or previous reporting period; and

(ii) Is of such a size, nature or incidence that disclosure is relevant to understanding the combined entity's financial statements.

And

(f) If amounts of tax due are forgiven as a result of the terms of the acquisition (see paragraphs 78–79):

(i) The amount of tax due that was forgiven; and

(ii) Where the acquirer is the tax authority, details of the adjustment made to tax receivable.

125. If the specific disclosures required by this and other IPSAS do not meet the objectives set out in paragraphs 119 and 123, the acquirer shall disclose whatever additional information is necessary to meet those objectives.

Effective Date and Transition

Effective Date

126. **This Standard shall be applied prospectively to public sector combinations for which the amalgamation date or acquisition date is on or after the beginning of the first annual reporting period**

beginning on or after January 1, 2019. Earlier application is encouraged. If an entity applies this Standard before January 1, 2019, it shall disclose that fact.

126A. **Paragraphs 25, 45, 70, 111, 115, 117 and AG88 were amended by IPSAS 41, issued in August 2018. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2023. Earlier application is encouraged. If an entity applies the amendments for a period beginning before January 1, 2023 it shall disclose that fact and apply IPSAS 41 at the same time.**

126B. **Paragraph 100A was added by *Improvements to IPSAS*, *2018*, issued in October 2018. An entity shall apply this amendment to public sector combinations for which the acquisition date is on or after the beginning of the first annual financial statements covering periods beginning on or after January 1, 2019. Earlier application is permitted. If an entity applies this amendment for a period beginning before January 1, 2019, it shall disclose that fact.**

126C. When an entity adopts accrual basis IPSAS Standards as defined in IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards*, for financial reporting purposes subsequent to this effective date, this Standard applies to the entity's annual financial statements covering periods beginning on or after the date of adoption of IPSAS Standards.

126D. **Paragraph 126C was amended by *Improvements to IPSAS, 2019*, issued in January 2020. An entity shall apply this amendment for annual financial statements covering periods beginning on or after January 1, 2021. Earlier application is permitted.**

126E. **Paragraphs 68, 71, 120, AG76 and AG89 were amended, paragraphs AG72–AG74 and their related heading were deleted, and paragraphs 82A and 82B and the related heading were added by IPSAS 43 issued in January 2022. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2025. Earlier application is permitted. If an entity applies the amendments for a period beginning before January 1, 2025, it shall disclose that fact and apply IPSAS 43 at the same time.**

126F. **Paragraph 124 was amended and paragraph 84A and the associated heading were added by IPSAS 44 issued in May 2022. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2025. Earlier application is permitted. If an entity applies the amendments for a period beginning before January 1, 2025, it shall disclose that fact and apply IPSAS 44 at the same time.**

126G. **Paragraph 72 was amended by IPSAS 46, *Measurement*, issued in May 2023. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2025. Earlier application is encouraged. If an entity applies the amendment for a period beginning before January 1, 2025, it shall disclose that fact and apply IPSAS 46 at the same time.**

126H. **Paragraphs 34, 79, 115, AG58, and AG86 were amended by IPSAS 47, *Revenue*, issued in May 2023. An entity shall apply this amendment for annual financial statements covering periods beginning on or after January 1, 2026. Earlier application is encouraged. If an entity applies the amendment for a period beginning before January 1, 2026, it shall disclose that fact and apply IPSAS 47 at the same time.**

126I. **Paragraphs 120(p)(ii), 124(b)(iii), and AG91 are amended, and the subheading above paragraph AG94 is amended by Part 3 of *Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement*, issued in August 2025. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2028. Earlier application is permitted.**

Transition

127. Assets and liabilities that arose from public sector combinations whose acquisition dates or amalgamation dates preceded the application of this Standard shall not be adjusted upon application of this Standard.

128. Contingent consideration balances arising from acquisitions whose acquisition dates preceded the date when an entity first applied this Standard shall not be adjusted upon first application of this Standard. Paragraphs 129–132 shall be applied in the subsequent accounting for those balances. Paragraphs 129–132 shall not apply to the accounting for contingent consideration balances arising from acquisitions with acquisition dates on or after the date when the entity first applied this Standard. In paragraphs 129–132 acquisitions refers exclusively to acquisitions whose acquisition date preceded the application of this Standard.

129. If an acquisition agreement provides for an adjustment to the cost of the acquisition contingent on future events, the acquirer shall include the amount of that adjustment in the cost of the acquisition at the acquisition date if the adjustment is probable and can be measured reliably.

130. An acquisition agreement may allow for adjustments to the cost of the acquisition that are contingent on one or more future events. The adjustment might, for example, be contingent on a specified level of profit being maintained or achieved in future periods, or on the market price of the instruments issued being maintained. It is usually possible to estimate the amount of any such adjustment at the time of initially accounting for the acquisition without impairing the reliability of the information, even though some uncertainty exists. If the future events do not occur or the estimate needs to be revised, the cost of the acquisition shall be adjusted accordingly.

131. However, when an acquisition agreement provides for such an adjustment, that adjustment is not included in the cost of the acquisition at the time of initially accounting for the acquisition if it either is not probable or cannot be measured reliably. If that adjustment subsequently becomes probable and can be measured reliably, the additional consideration shall be treated as an adjustment to the cost of the acquisition.

132. In some circumstances, the acquirer may be required to make a subsequent payment to the seller as compensation for a reduction in the value of the assets given, equity instruments issued or liabilities incurred or assumed by the acquirer in exchange for control of the acquired operation. This is the case, for example, when the acquirer guarantees the market price of equity or debt instruments issued as part of the cost of the acquisition and is required to issue additional equity or debt instruments to restore the originally determined cost. In such cases, no increase in the cost of the acquisition is recognized. In the case of equity instruments, the fair value of the additional payment is offset by an equal reduction in the value attributed to the instruments initially issued. In the case of debt instruments, the additional payment is regarded as a reduction in the premium or an increase in the discount on the initial issue.

133. An entity, such as a mutual entity, that has not yet applied this Standard and had one or more public sector combinations that were accounted for using the purchase method (which involves the amortization of goodwill) shall apply the transition provisions in paragraphs AG114–AG115.

Income taxes

134. For public sector combinations in which the acquisition date or amalgamation date was before this Standard is applied, the acquirer or resulting entity shall apply the requirements of the relevant international or national accounting standard dealing with income taxes prospectively. From the date when this Standard is applied, the acquirer or resulting entity shall recognize any changes required by the relevant international or national accounting standard dealing with income taxes as an adjustment to surplus or deficit (or, if required by the relevant international or national accounting standard dealing with income taxes, outside surplus or deficit).

Appendix A

Application Guidance

This Appendix is an integral part of IPSAS 40.

Definitions (see paragraph 5)

AG1. Paragraph 5 of this Standard defines a resulting entity as "the entity that is the result of two or more operations combining in an amalgamation." A resulting entity is not initially a party to the public sector combination. A resulting entity may have the legal form of a new entity, or may retain the legal identity of one of the combining operations. However, a resulting entity usually has the economic substance of a new entity. In a combination in which one party to the combination gains control of one or more operations, and in which the economic substance is that of an amalgamation, the nature of the combination is usually that the resulting entity has the substance of a new entity.

Identifying a Public Sector Combination (see paragraph 6)

AG2. Paragraph 5 of this Standard defines a public sector combination as "the bringing together of separate operations into one public sector entity." The reference to one public sector entity may be to a single entity or to an economic entity. Some public sector reorganizations may involve more than one public sector combination. The circumstances in which a public sector combination might occur include:

(a) By mutual agreement; and

(b) By compulsion (for example by legislation).

AG3. Paragraph 5 of this Standard defines an operation as "an integrated set of activities and related assets and/or liabilities that is capable of being conducted and managed for the purpose of achieving an entity's objectives, by providing goods and/or services."

AG4. An operation consists of inputs and processes applied to those inputs that have the ability to create outputs. Although operations usually have outputs, outputs are not required for an integrated set of activities and related assets and/or liabilities to qualify as an operation. For the purposes of this standard, the three elements of an operation are defined as follows:

(a) **Input**: Any economic resource that creates, or has the ability to create, outputs when one or more processes are applied to it.

(b) **Process**: Any system, standard, protocol, convention or rule that when applied to an input or inputs, creates or has the ability to create outputs.

(c) **Output**: The result of inputs and processes applied to those inputs that provide, or have the ability to provide, goods and/or services.

The definitions of an input and an output differ from those in RPG 3, *Reporting Service Performance Information*. This is because RPG 3 focuses on recipients who are external to the entity; an operation may have recipients who are internal to an entity.

AG5. To be capable of being conducted and managed for the purposes defined, an integrated set of activities and assets and/or liabilities requires two essential elements—inputs and processes applied to those inputs, which together are or will be used to create outputs. However, an operation need not include all of the inputs or processes that the transferor used in operating that operation if the entity that receives the operation or operations is capable of continuing to produce outputs, for example, by integrating the operation with their own inputs and processes.

AG6. The nature of the elements of an operation varies by sector and by the structure of an entity's operations (activities), including the entity's stage of development. Established operations often have many different types of inputs, processes and outputs, whereas new operations often have few inputs and processes and sometimes only a single output (product). Nearly all operations also have liabilities, but an operation need not have liabilities.

AG7. An integrated set of activities and assets and/or liabilities in the development stage might not have outputs. In these cases, the entity that receives the operation should consider other factors to determine whether the set is an operation. Those factors include, but are not limited to, whether the set:

(a) Has begun planned principal activities;

(b) Has employees, intellectual property and other inputs and processes that could be applied to those inputs;

(c) Is pursuing a plan to produce outputs; and

(d) Will be able to obtain access to service recipients that will receive the outputs.

Not all of those factors need to be present for a particular integrated set of activities and assets and/or liabilities in the development stage to qualify as an operation.

AG8. Determining whether a particular set of activities and assets and/or liabilities is an operation should be based on whether the integrated set is capable of being conducted and managed as an operation by another entity. Thus, in evaluating whether a particular set is an operation, it is not relevant whether a transferor operated the set as an operation or whether the acquirer intends to operate the set as an operation.

AG9. In the absence of evidence to the contrary, a particular set of activities and assets and/or liabilities in which goodwill is present shall be presumed to be an operation. However, an operation need not have goodwill.

Classification of Public Sector Combinations (see paragraphs 7–14)

Assessment of Control (see paragraphs 7–8)

AG10. Where a party to a public sector combination gains control of one or more operations as a result of that combination, the combination is classified as either an amalgamation or an acquisition, depending on the economic substance of the combination. If no party to the combination gains control, the combination is classified as an amalgamation. In making this assessment the first step is to determine whether one of the entities that existed prior to the public sector combination has gained control of one or more operations. Because this determination is made by reference to the entities that existed prior to the public sector combination, it differs from the assessment of control made in accordance with IPSAS 35, *Consolidated Financial Statements*, where the assessment of control is made by reference to the entities that exist after a public sector combination has taken place.

AG11. In determining whether one party to a public sector combination gains control of one or more operations as a result of the combination, an entity applies the principles and guidance in IPSAS 35. In applying the principles and guidance, references to "an entity controls" are read as "an entity gains control of" and references to "another entity" are read as "an operation". For example, in determining whether one party to a public sector combination gains control of one or more operations as a result of the combination for the purposes of this Standard, paragraph 20 of IPSAS 35 should be read as follows (amended text is shown in italics):

> Thus, an entity *gains control of an operation* if and only if the entity *gains* all the following:
>
> (a) Power over the operation (see paragraphs 23–29);

(b) Exposure, or rights, to variable benefits from its involvement with the operation (see paragraphs 30–34); and

(c) The ability to use its power over the operation to affect the nature or amount of the benefits from its involvement with the operation (see paragraphs 35–37).

AG12. In applying the principles and guidance in IPSAS 35, an entity has regard to paragraphs AG13–AG18.

AG13. A public sector combination effected primarily by the transfer of consideration (i.e., by transferring cash or other assets or by incurring liabilities) -usually results in one entity gaining control of one or more operations.

AG14. A public sector combination effected primarily by exchanging equity interests usually results in one entity gaining control of one or more operations. Combinations involving an exchange of equity interests usually results in one entity having sufficient voting rights to gain control of one or more operations. This may occur without the entity having a majority of the voting rights where the entity has a large minority voting interest and no other owner or organized group of owners has a significant voting interest.

AG15. A public sector combination involving the issuance of equity interests may give rise to a reverse acquisition (see paragraphs AG66–AG71). An entity considers this possibility in determining whether one party to a public sector combination gains control of operations.

AG16. In a public sector combination involving more than two entities, the party to the public sector combination that initiates the combination (if any) is more likely to gain control of operations than the other parties to the combination.

AG17. In a public sector combination in which a new entity is formed to effect the combination, that entity may gain control of operations only where the entity exists prior to the combination taking place. Where this new entity does not exist prior to the combination taking place, an entity considers whether one of the parties to the combination that existed prior to the combination taking place gains control of operations.

AG18. If the application of this guidance identifies one party to the combination as gaining control of one or more operations, the combination is classified as either an amalgamation or an acquisition, depending on the economic substance of the combination. An entity considers the guidance in paragraphs 9–14 and AG19–AG50 to determine whether the economic substance of the combination is that of an amalgamation. If the application of the guidance does not identify one party to the combination as gaining control of one or more operations, the combination shall be classified as an amalgamation.

Assessment of the Classification of a Public Sector Combination (see paragraphs 9–14)

AG19. If one party to a public sector combination gains control of one or more operations as a result of the combination, the combination shall be classified as either an amalgamation or an acquisition, depending on the economic substance of the combination. In assessing whether the economic substance of the combination is that of an amalgamation, an entity considers the economic substance of the public sector combination and the indicators in paragraphs 12–14. A combination that does not have the economic substance of an amalgamation shall be classified as an acquisition. In making this assessment, an entity considers the following guidance.

Economic Substance (see paragraph 9)

AG20. Usually, an analysis of the indicators in paragraphs 12–13, individually or on combination, will produce a conclusive result and provide sufficient evidence to determine whether the economic substance of the combination is that of an amalgamation. A combination does not need to satisfy both of these indicators to be classified as an amalgamation.

AG21. Where consideration of the indicators in paragraphs 12–13 produces inconclusive results or does not provide sufficient evidence to clearly determine the economic substance of the combination, an entity considers the additional matters in paragraph 14.

AG22. The economic substance of an amalgamation is usually that a new entity is formed, irrespective of the legal form of the resulting entity. This applies equally to a combination in which one party to the combination gains control of one or more operations. If the economic substance of a public sector combination is that one of the parties to the combination continues to exist, this may provide evidence that the economic substance of the combination is that of an acquisition. In combinations of operations under common control, the fact that the ultimate controlling entity controls the operations both before and after the combination reduces the significance of this factor.

AG23. An amalgamation involves the integration of the operations that are part of the public sector combination. In other words, an amalgamation does not give rise to a controlling entity/controlled entity relationship between parties to a combination. If, following the combination, any of the operations operate as controlled entities of a party to the combination, this may provide evidence that the economic substance of the combination is that of an acquisition.

AG24. An acquisition is usually a mutual agreement between two or more parties, and usually has commercial substance. However, in the public sector, a party to the combination may be able to impose a public sector combination on the other party to the combination. Where this results in the entity gaining access to economic benefits or service potential that are similar to those that could have been obtained by mutual agreement, it is probable that the economic substance of the public sector combination is that of an acquisition. For example, a central government may centralize a service for which it had been providing funding, by requiring local government entities to transfer operations to the central government in order to achieve economies of scale. Where the entity does not gain access to economic benefits or service potential that are similar to those that could have been obtained in a voluntary transaction, it is probable that the economic substance of the public sector combination is that of an amalgamation.

AG25. Where, after consideration of the indicators and the nature of the public sector combination, there is insufficient evidence that the public sector combination has the economic substance of an amalgamation, the combination shall be classified as an acquisition.

Indicators Relating to Consideration (see paragraph 12)

AG26. Amalgamations usually do not involve the payment of consideration to compensate a seller for giving up their entitlement to the net assets of an operation. By contrast, acquisitions usually involve an exchange of consideration between those gaining control of the operations and those losing control of the operations.

AG27. The payment of consideration that is intended to compensate those with an entitlement to the net assets of the transferred operation for giving up that entitlement provides evidence that the economic substance of the public sector combination is an acquisition. In such cases, the combination is classified as an acquisition.

AG28. The payment of consideration that is not intended to compensate the seller for giving up their entitlement to the net assets of an operation, but is, for example, intended to reimburse them for costs incurred in effecting the public sector combination, may provide evidence that the economic substance of the combination is that of an amalgamation.

AG29. Acquisitions may occur without an exchange of consideration, for example where an individual bequeaths an operation to a government entity. Consequently, the absence of consideration does not in itself provide evidence of the economic substance of the public sector combination. In assessing consideration, an entity also considers the reasons why consideration was either paid or not paid.

AG30. Where a public sector combination does not include the payment of consideration, an entity considers the reasons why no consideration has been paid. If the former owner has given up their entitlement to the net assets of an operation, or has had their entitlement extinguished through compulsion (for example, in an uncompensated seizure), there may be evidence that the combination is an acquisition.

AG31. Where a public sector combination does not include the payment of consideration because there is no party with an entitlement to the net assets of an operation, the economic substance of the combination will usually be that of an amalgamation. An acquisition involves a transfer of an operation from its former owner to its new owner. If there is no party with an entitlement to the net assets of an operation, there is no former owner, and the combination is usually not an acquisition. This scenario will only arise where a complete entity is being transferred; where an individual operation is being transferred, the entity transferring the operation will be the former owner and will be entitled to the net assets of the operation. Examples of entities where there will be no former owner(s) include municipalities and some not-for-profit organizations.

Indicators Relating to the Decision-Making Process (see paragraph 13)

AG32. An acquisition usually requires the voluntary participation of all the parties to the combination. Consequently, where a public sector combination is imposed by a third party without any party to the combination being involved in the decision-making process, this may provide evidence that the economic substance of the combination is an amalgamation.

AG33. In other circumstances, the parties to the public sector combination will be able to influence the terms of the combination to different degrees even when the combination is imposed by a third party. As the degree of influence the parties to the combination have increases, particularly the influence of the party that gains control of one or more operations, it becomes less likely that a conclusion regarding the economic substance of the combination can be drawn.

AG34. For example, the parties to the combination may be directed to combine by a regulator, but the regulator allows the parties to determine the terms of the combination. The economic substance of this public sector combination is likely to be determined by the terms of the combination agreed by the parties rather than by the decision of the regulator that the parties must combine.

AG35. Where the party to the public sector combination that gains control of one or more operations is able to impose the combination on the other party, this does not provide evidence that the economic substance of the combination is that of an amalgamation. For example, a government may decide to nationalize a private sector entity, contrary to the wishes of the shareholders. The fact that the government (a party to the combination) is able to impose the nationalization, for example through legislation, does not provide evidence that the economic substance of the combination is an amalgamation. Where the party to the combination that gains control of one or more operations is able to impose the combination on the other party, this provides evidence that the economic substance of the combination is that of an acquisition.

AG36. Where a public sector combination is subject to approval by each party's citizens through referenda, this may provide evidence that the economic substance of the combination is that of an amalgamation. Such a requirement provides evidence that the parties to the combination do not have freedom to voluntarily effect the combination and that the ultimate decision as to whether the combination takes place is taken by third parties. However, it is possible for citizens to approve, through referenda, a combination whose terms are those of an acquisition.

AG37. Where a public sector combination takes place between two parties that are under common control, this may provide evidence that the economic substance of the combination is that of an amalgamation. Public sector combinations under common control are often instigated by and on behalf of the controlling entity, and the controlling entity will often determine the terms of the combination. For example, a government may decide to combine two ministries for administrative or political reasons, and specify the terms of the combination. In

such circumstances, the ultimate decision as to whether the combination takes place, and the terms of the combination, are determined by the controlling entity. This provides evidence that the economic substance of the combination is an amalgamation.

AG38. In some circumstances, two operations under common control may agree to combine voluntarily. However, this decision will usually be subject to the approval of the controlling entity, whether this approval is given explicitly or not. Where the approval of the controlling entity is required, this provides evidence that the ultimate decision as to whether the combination takes place, and the terms of the combination, are determined by the controlling entity. Consequently, this provides evidence that the economic substance of the combination is that of an amalgamation.

AG39. Only where there is no evidence that the controlling entity is involved in the public sector combination, either by instigating the combination, determining the terms of the combination, or approving (whether explicitly or implicitly) the combination, will there be no evidence that the economic substance of the combination is that of an amalgamation. In such circumstances, the entity considers all other factors in determining the classification of the public sector combination.

Additional Matters to be Considered Where the Indicators Relating to Consideration and the Decision-Making Process do not Provide Sufficient Evidence to Determine Whether the Economic Substance of the Combination is that of an Amalgamation (see paragraph 14)

AG40. Where an analysis of the indicators relating to consideration and the decision-making process produces inconclusive results or does not provide sufficient evidence to determine whether the economic substance of the combination is that of an amalgamation, an entity considers which classification and resulting accounting treatment would provide information that:

(a) Best meets the objectives of financial reporting; and

(b) Best satisfies the qualitative characteristics (QCs).

AG41. An analysis of the indicators relating to consideration and the decision-making process will usually produce a conclusive result and provide sufficient evidence to determine whether the economic substance of the combination is that of an amalgamation. This is because the indicators relating to consideration and the decision-making process will provide evidence of the economic substance of a public sector combination in all but exceptional circumstances. As a result, where it is clear that the indicators have been met, the additional matters set out in paragraph 14 are not considered in determining the classification.

AG42. Where an analysis of the indicators relating to consideration and the decision-making process provides inconclusive results or does not provide sufficient evidence to determine whether the economic substance of the combination is that of an amalgamation, an entity considers which classification would provide information that best meets the objectives of financial reporting. The determination of whether a public sector combination is classified as an acquisition or an amalgamation can significantly affect the financial reporting of the combination. Consequently, it is important to consider the information each method provides and the principal users of that information.

AG43. The modified pooling of interests method views the combination from the perspective of each of the combining operations and their owners or constituents who are uniting their interests in the resulting entity. Using the modified pooling of interests method of accounting, the combining operations measure the reported assets and liabilities at their carrying amounts in the financial statements of the combining operations as of the amalgamation date. Such information may assist users in assessing the performance of the resulting entity based upon the combined historical assets and liabilities of the combining operations at the date of the amalgamation and in comparing operating results with prior periods. However, this comparability may be reduced where adjustments to achieve consistent accounting policies are required. It does not include

information about the market's expectation of the value of the future cash flows associated with assets and liabilities, other than assets and liabilities recorded at fair value prior to the date of the amalgamation.

AG44. The acquisition method views a combination from the perspective of the acquirer—the entity that gains control of the other operations. The acquirer purchases or otherwise gains control over net assets and recognizes in its financial statements the assets acquired and liabilities assumed, including those not previously recognized by the acquired operation. Such information assists users of the financial statements in assessing the initial investments made and the subsequent performance of those investments and comparing them with the performance of other entities based on the investment made by the acquirer. It also includes information about the market's expectation of the value of the future cash flows associated with those assets and liabilities. While it revalues the assets and liabilities of the acquired operation, it does not affect the valuation of assets and liabilities held by the acquirer prior to the acquisition. Further, depending on the relationship between the amounts in paragraph 85(a) and 85(b) and other factors (for example, a bargain purchase), it may result in the immediate recognition of a gain or loss through surplus or deficit.

AG45. The information provided by each approach is summarized in the following table.

	Amalgamation	**Acquisition**
Perspective	Perspective of each of the combining operations and their owners or constituents.	Perspective of the acquirer.
User information	Assists users of the financial statements in assessing the performance of the resulting entity based upon the combined historical assets and liabilities of the combining operations at the date of the amalgamation and in comparing operating results with prior periods.	Assists users of the financial statements in assessing the initial investments made and the subsequent performance of those investments.
Basis of reported values	Measures the reported assets and liabilities at their carrying amounts in the financial statements of the combining operations as of the amalgamation date.	Revalues the identifiable assets and liabilities of the acquired operation but does not affect the valuation of assets and liabilities held by the acquirer. Includes information about the market's expectation of the value of the future cash flows associated with those assets and liabilities.
Ability to compare to operating results of prior periods	May facilitate the comparison of operating results with prior periods. Comparability may be reduced where adjustments to achieve consistent accounting policies are required.	Difficult to compare operating results with prior periods.

AG46. Consideration of which classification would provide information that best meets the objectives of financial reporting provides evidence of the economic substance of the public sector combination where an analysis of the indicators relating to consideration and the decision-making process provides inconclusive results or does not provide sufficient evidence to -determine whether the economic substance of the combination is that of an amalgamation.

AG47. Where an analysis of the indicators relating to consideration and the -decision-making process provides inconclusive results or does not provide sufficient evidence to determine the classification of the combination, an entity considers which classification would provide information that best satisfies the QCs

of relevance, faithful representation, understandability, timeliness, comparability and verifiability. In making this assessment, an entity also considers the constraints on information included in general purpose financial reports, which are materiality, cost-benefit and the balance between the QCs.

AG48. When considering the classification of a public sector combination, some QCs will be more significant than others. For example, timeliness will be less significant than understandability when considering whether a combination is an amalgamation or an acquisition.

AG49. An entity considers the QCs and the constraints on information from the perspective of the users of the financial statements. This will include consideration of the following questions; this list is not exhaustive.

(a) Which classification most faithfully represents the economic substance of the public sector combination, which may be different from its legal form? Does that classification faithfully represent an entity's financial performance and financial position?

(b) Which classification will help users understand the nature of the public sector combination? For example, in an amalgamation, any difference between the total recognized assets and total recognized liabilities is recognized in net assets/equity, whereas in an acquisition, the acquirer recognizes goodwill, or a gain or loss in the reporting period. Which approach best helps the user to understand the nature of the combination?

(c) Users' needs are best served when the information provided in respect of a transaction is comparable. How are similar public sector combinations classified?

AG50. Consideration of which classification would provide information that best meets the QCs provides evidence of the economic substance of the public sector combination where an analysis of the indicators relating to consideration and the decision-making process provides inconclusive results or does not provide sufficient evidence to determine whether the economic substance of the combination is that of an amalgamation.

Accounting for Amalgamations

Eliminating Transactions Between the Combining Operations (see paragraph 22)

AG51. A resulting entity eliminates the effects of all transactions between the combining operations. For many transactions, elimination will take place automatically. For example, one combining operation provided services for a fee to another combining operation prior to the amalgamation date. The revenue of the combining operation that provided the services is reflected in that combining operation's accumulated surplus or deficit at the amalgamation date. The expense of the combining operation receiving the services is reflected in that combining operation's accumulated surplus or deficit at the amalgamation date. The resulting entity will recognize both amounts in net assets/equity.

AG52. Elimination may not take place automatically where one combining operation has recognized an asset, and another combining operation has recognized a corresponding liability as a result of the transaction between two combining operations. The resulting entity eliminates both the asset and the liability, and recognizes any difference between the asset and liability in net assets/equity.

Carrying Amounts to be Used (see paragraphs 26–27)

AG53. Where a combining operation has previously been acquired in an acquisition (i.e., it was previously an acquired operation), the carrying amounts of the combining operation's assets and liabilities in its separate financial statements may be different to the carrying amounts of those assets and liabilities in the controlling entity's financial statements. In an acquisition, the controlling entity would measure the combining operation's assets and liabilities at their fair value. However, where the combining operation (i.e., the previously acquired operation) continues to prepare separate financial statements, it would use its previous carrying amounts.

The fair value measurements in the financial statements of the controlling entity are not pushed down to the combining operation.

AG54. To meet the requirements in paragraphs 26–27, a resulting entity measures the identifiable assets and liabilities of the combining operations at their carrying amounts in the financial statements of the combining operations as of the amalgamation date, subject to the requirement to adjust the carrying amounts to conform to the resulting entity's accounting policies. The resulting entity does not measure the assets and liabilities at the carrying amounts in the financial statements of the controlling entity.

Licenses and Similar Rights Previously Granted by One Combining Operation to Another Combining Operation (see paragraph 32)

AG55. As part of an amalgamation, a resulting entity may receive a license or similar right that had previously been granted by one combining operation to another combining operation to use one or more of the grantor's recognized or unrecognized assets. Examples of such rights include a right to use the acquirer's technology under a technology licensing agreement. The resulting entity recognizes this license or similar right as an identifiable intangible asset, and measures the intangible asset at its carrying amount in the financial statements of the combining operation as of the amalgamation date. Because the license or similar right has previously been part of a binding arrangement, the license satisfies both the separability and binding arrangement criteria in IPSAS 31, *Intangible Assets*. Paragraph 47 provides guidance on the subsequent accounting for a license or similar right previously granted by one combining operation to another combining operation.

AG56. The resulting entity assesses both the license or similar right previously granted by one combining operation to another combining operation, and the underlying asset (where the underlying asset is a recognized asset) for impairment in accordance with IPSAS 21, *Impairment of Non-Cash-Generating Assets* and IPSAS 26, *Impairment of Cash-Generating Assets*, at the amalgamation date.

Forgiveness of Amounts of Tax Due in an Amalgamation (Where Included in the Terms of the Amalgamation) (see paragraphs 33–34)

AG57. The resulting entity shall not recognize any amounts in respect of a combining operation's tax due where these amounts have been forgiven by a tax authority as part of the terms of the amalgamation. Where tax forgiveness occurs subsequent to an amalgamation, the resulting entity applies the requirements in paragraph 49. In applying the modified pooling of interests method of accounting, the resulting entity shall treat those amounts included in the terms of the amalgamation as having been derecognized prior to the amalgamation. The resulting entity shall account for a combining operation's tax due that has not been forgiven by a tax authority in accordance with the relevant international or national accounting standard dealing with income taxes.

AG58. Where, as a result of the amalgamation, the resulting entity becomes the tax authority, it shall derecognize any tax receivable relating to the combining operation's tax due that has been forgiven in accordance with IPSAS 47, *Revenue*.

Recognition of Goodwill (see paragraph 36)

AG59. Amalgamations do not give rise to goodwill, and consequently a resulting entity does not recognize goodwill arising from an amalgamation. Paragraphs 37–38 specify the treatment of the net assets/equity arising as a result of the amalgamation.

AG60. Where a combining operation has previously recognized goodwill as a result of a previous acquisition, the resulting entity recognizes this goodwill in its opening statement of financial position.

Subsequent Measurement of Transfers, Concessionary Loans and Similar Benefits Received by a Combining Operation on the Basis of Criteria that May Change as a Result of an Amalgamation (see paragraph 48)

AG61. Prior to an amalgamation taking place, a combining operation may receive a transfer from a third party, based on specified criteria. For example, a national government may provide grants to those municipalities where the average household income is below a threshold. An amalgamation of two municipalities may involve one municipality which met the criteria and received the grant, and one municipality which did not meet the criteria and which did not receive the grant. Following the amalgamation, the average household income of the new, combined municipality will either be above or below the threshold, which may cause the grantor to reassess the amount of grant given.

AG62. The resulting entity shall not account for any revisions to the grant amount as part of the amalgamation, but shall account for any revisions at the point the grantor makes its intentions known in accordance with other IPSAS.

AG63. Similar circumstances may arise in respect of concessionary loans and other benefits. The resulting entity shall not account for any revisions to those transactions as part of the amalgamation, but shall account for any revisions at the point the grantor makes its intentions known in accordance with other IPSAS.

Amalgamations Occurring during a Reporting Period (see paragraphs 50–52)

AG64. To meet the requirements of paragraphs 50–52, the resulting entity is not required to present financial statements for periods prior to the amalgamation date, although it may elect to do so by making the disclosures specified in paragraph 54(g). Where the resulting entity does not elect to present financial statements for periods prior to the amalgamation date, it meets the needs of the users of its financial statements for information about the combining -operations prior to the amalgamation by:

(a) Where financial statements have been issued on behalf of the combining operations for a reporting period ending immediately prior to the amalgamation date (which may be a partial period), directing the users of its financial statements to the financial statements issued on behalf of the combining operations.

(b) Where no financial statements have been issued on behalf of the combining operations for a reporting period ending immediately prior to the amalgamation date (which may be a partial period), making the disclosures required by paragraph 54(h).

AG65. To satisfy the requirements of a regulator, it may be necessary for the combining operations and/or the resulting entity to present or disclose information in addition to that required by this Standard.

Accounting for Acquisitions

Reverse Acquisitions

AG66. A reverse acquisition occurs when the entity that issues securities (the legal acquirer) is identified as the acquired operation for accounting purposes on the basis of the guidance in paragraphs AG10–AG18. The entity whose equity interests are acquired (the legal acquired operation) must be the acquirer for accounting purposes for the transaction to be considered a reverse acquisition. For example, reverse acquisitions sometimes occur when a public sector entity wants to become a listed entity but does not want to register its equity shares. To accomplish that, the public sector entity will arrange for a listed entity to acquire its equity interests in exchange for the equity interests of the listed entity. In this example, the listed entity is the legal acquirer because it issued its equity interests, and the public sector entity is the legal acquired operation because its equity interests were acquired. However, application of the guidance in paragraphs AG10–AG18 results in identifying:

(a) The listed entity as the acquired operation for accounting purposes (the accounting acquired operation)–i.e., the listed entity does not gain control of one or more operations; and

(b) The public sector entity as the acquirer for accounting purposes (the accounting acquirer)–i.e., the public sector entity does gain control of one or more operations.

The accounting acquired operation must meet the definition of an operation for the transaction to be accounted for as a reverse acquisition, and all of the recognition and measurement principles in this Standard, including the requirement to recognize goodwill, apply.

Measuring the Consideration Transferred

AG67. In a reverse acquisition, the accounting acquirer usually issues no consideration for the acquired operation. Instead, the accounting acquired operation usually issues its equity shares to the owners of the accounting acquirer. Accordingly, the acquisition-date fair value of the consideration transferred by the accounting acquirer for its interest in the accounting acquired operation is based on the number of equity interests the legal controlled entity would have had to issue to give the owners of the legal controlling entity the same percentage equity interest in the combined entity that results from the reverse acquisition. The fair value of the number of equity interests calculated in that way can be used as the fair value of consideration transferred in exchange for the acquired operation.

Preparation and Presentation of Consolidated Financial Statements

AG68. Consolidated financial statements prepared following a reverse acquisition are issued under the name of the legal controlling entity (accounting acquired operation) but described in the notes as a continuation of the financial statements of the legal controlled entity (accounting acquirer), with one adjustment, which is to adjust retroactively the accounting acquirer's legal capital to reflect the legal capital of the accounting acquired operation. That adjustment is required to reflect the capital of the legal controlling entity (the accounting acquired operation). Comparative information presented in those consolidated financial statements also is retroactively adjusted to reflect the legal capital of the legal controlling entity (accounting acquired operation).

AG69. Because the consolidated financial statements represent the continuation of the financial statements of the legal controlled entity except for its capital structure, the consolidated financial statements reflect:

(a) The assets and liabilities of the legal controlled entity (the accounting acquirer) recognized and measured at their pre-combination carrying amounts.

(b) The assets and liabilities of the legal controlling entity (the accounting acquired operation) recognized and measured in accordance with this Standard.

(c) The accumulated surplus or deficit and other equity balances of the legal controlled entity (accounting acquirer) before the acquisition.

(d) The amount recognized as issued equity interests in the consolidated financial statements determined by adding the issued equity interest of the legal controlled entity (the accounting acquirer) outstanding immediately before the acquisition to the fair value of the legal controlling entity (accounting acquired operation). However, the equity structure (i.e., the number and type of equity interests issued) reflects the equity structure of the legal controlling entity (the accounting acquired operation), including the equity interests the legal controlling entity issued to effect the acquisition. Accordingly, the equity structure of the legal controlled entity (the accounting acquirer) is restated using the exchange ratio established in the acquisition agreement to reflect the number of shares of the legal controlling entity (the accounting acquired operation) issued in the reverse acquisition.

(e) The non-controlling interest's proportionate share of the legal controlled entity's (accounting acquirer's) pre-acquisition carrying amounts of retained earnings and other equity interests as discussed in paragraphs AG70 and AG71.

Non-Controlling Interest

AG70. In a reverse acquisition, some of the owners of the legal acquired operation (the accounting acquirer) might not exchange their equity interests for equity interests of the legal controlling entity (the accounting acquired operation). Those owners are treated as a non-controlling interest in the consolidated -financial statements after the reverse acquisition. That is because the owners of the legal acquired operation that do not exchange their equity interests for equity interests of the legal acquirer have an interest in only the results and net assets of the legal acquired operation—not in the results and net -assets of the combined entity. Conversely, even though the legal acquirer is the -acquired operation for accounting purposes, the owners of the legal acquirer have an interest in the results and net assets of the combined entity.

AG71. The assets and liabilities of the legal acquired operation are measured and recognized in the consolidated financial statements at their pre-combination carrying amounts (see paragraph AG69(a)). Therefore, in a reverse acquisition the non-controlling interest reflects the non-controlling shareholders' proportionate interest in the pre-acquisition carrying amounts of the legal acquired operation's net assets even if the non-controlling interests in other acquisitions are measured at their fair value at the acquisition date.

Recognizing Particular Assets Acquired and Liabilities Assumed in an Acquisition (see paragraphs 64–68)

AG72. [Deleted]

AG73. [Deleted]

AG74. [Deleted]

Intangible Assets

AG75. The acquirer shall recognize, separately from goodwill, the identifiable intangible assets acquired in an acquisition. An intangible asset is identifiable if it meets either the separability criterion or the binding arrangement criterion.

AG76. An intangible asset that meets the binding arrangement criterion is identifiable even if the asset is not transferable or separable from the acquired operation or from other rights and obligations. For example:

(a) [Deleted]

(b) An acquired operation owns and operates a nuclear power plant. The license to operate that power plant is an intangible asset that meets the binding arrangement criterion for recognition separately from goodwill, even if the acquirer cannot sell or transfer it separately from the acquired power plant. An acquirer may recognize the fair value of the operating license and the fair value of the power plant as a single asset for financial reporting purposes if the useful lives of those assets are similar.

(c) An acquired operation owns a technology patent. It has licensed that patent to others for their exclusive use outside the domestic market, receiving a specified percentage of future foreign revenue in exchange. Both the technology patent and the related license agreement meet the binding arrangement criterion for recognition separately from goodwill even if selling or exchanging the patent and the related license agreement separately from one another would not be practical.

AG77. The separability criterion means that an acquired intangible asset is capable of being separated or divided from the acquired operation and sold, transferred, licensed, rented or exchanged, either individually or together with a related binding arrangement, identifiable asset or liability. An intangible asset that the acquirer would be able to sell, license or otherwise exchange for something else of value meets the separability

criterion even if the acquirer does not intend to sell, license or otherwise exchange it. An acquired intangible asset meets the separability criterion if there is evidence of exchange transactions for that type of asset or an asset of a similar type, even if those transactions are infrequent and regardless of whether the acquirer is involved in them. For example, lists of users of a service are frequently licensed and thus meet the separability criterion. Even if an acquired operation believes its lists of users of a service have characteristics different from other lists of users of a service, the fact that lists of users of a service are frequently licensed generally means that the acquired list of users of a service meets the separability criterion. However, a list of users of a service acquired in an -acquisition would not meet the separability criterion if the terms of confidentiality or other agreements prohibit an entity from selling, leasing or otherwise exchanging information about its users of a service.

AG78. An intangible asset that is not individually separable from the acquired operation or combined entity meets the separability criterion if it is separable in combination with a related binding arrangement, identifiable asset or -liability. For example, an acquired operation owns a registered trademark and documented but unpatented technical expertise used to manufacture the trademarked product. To transfer ownership of a trademark, the owner is also required to transfer everything else necessary for the new owner to produce a product or service indistinguishable from that produced by the former owner. Because the unpatented technical expertise must be separated from the acquired operation or combined entity and sold if the related trademark is sold, it meets the separability criterion.

Reacquired Rights

AG79. As part of an acquisition, an acquirer may reacquire a right that it had previously granted to the acquired operation to use one or more of the acquirer's recognized or unrecognized assets. Examples of such rights include a right to use the acquirer's technology under a technology licensing agreement. A reacquired right is an identifiable intangible asset that the acquirer recognizes separately from goodwill or a gain from a bargain purchase. Paragraph 83 provides guidance on measuring a reacquired right and paragraph 113 provides guidance on the subsequent accounting for a reacquired right.

AG80. If the terms of the binding arrangement giving rise to a reacquired right are favorable or unfavorable relative to the terms of current market transactions for the same or similar items, the acquirer shall recognize a settlement gain or loss. Paragraph AG100 provides guidance for measuring that settlement gain or loss.

Assembled Workforce and Other Items that are not Identifiable

AG81. The acquirer subsumes into goodwill the value of an acquired intangible asset that is not identifiable as of the acquisition date. For example, an acquirer may attribute value to the existence of an assembled workforce, which is an existing collection of employees that permits the acquirer to continue to operate an acquired operation from the acquisition date. An assembled workforce does not represent the intellectual capital of the skilled workforce—the (often specialized) knowledge and experience that employees of an acquired operation bring to their jobs. Because the assembled workforce is not an identifiable asset to be recognized separately from goodwill or a gain from a bargain purchase, any value attributed to it is subsumed into goodwill or a gain from a bargain purchase.

AG82. The acquirer also subsumes into goodwill or a gain from a bargain purchase any value attributed to items that do not qualify as assets at the acquisition date. For example, the acquirer might attribute value to potential binding arrangements the acquired operation is negotiating with prospective new customers at the acquisition date. Because those potential binding arrangements are not themselves assets at the acquisition date, the acquirer does not recognize them separately from goodwill or a gain from a bargain purchase. The acquirer should not subsequently reclassify the value of those binding arrangements from goodwill for events that occur after the acquisition date. However, the acquirer should assess the facts and circumstances

surrounding events occurring shortly after the acquisition to determine whether a separately recognizable intangible asset existed at the acquisition date.

AG83. After initial recognition, an acquirer accounts for intangible assets acquired in an acquisition in accordance with the provisions of IPSAS 31. However, as described in paragraph 6 of IPSAS 31, the accounting for some acquired intangible assets after initial recognition is prescribed by other IPSAS.

AG84. The identifiability criteria determine whether an intangible asset is recognized separately from goodwill. However, the criteria neither provide guidance for measuring the fair value of an intangible asset nor restrict the assumptions used in measuring the fair value of an intangible asset. For example, the acquirer would take into account the assumptions that market participants would use when pricing the intangible asset, such as expectations of future renewals of binding arrangements, in measuring fair value. It is not necessary for the renewals themselves to meet the identifiability criteria. (However, see paragraph 83, which establishes an exception to the fair value measurement principle for reacquired rights recognized in an acquisition.) Paragraphs 39D and 39E of IPSAS 31 provide guidance for determining whether intangible assets should be combined into a single unit of account with other intangible or tangible assets.

Forgiveness of Amounts of Tax Due in an Acquisition (Where Included in the Terms of the Acquisition) (see paragraphs 78–79)

AG85. The acquirer shall not recognize any amounts in respect of an acquired operation's tax due where these amounts have been forgiven by a tax authority as part of the terms of the acquisition. Where tax forgiveness occurs subsequent to an acquisition, the resulting entity applies the requirements in paragraph 118. The acquirer shall account for an acquired operation's tax due that has not been forgiven by a tax authority in accordance with the relevant international or national accounting standard dealing with income taxes.

AG86. If the acquirer is itself the tax authority, it shall derecognize any tax receivable relating to the acquired operation's tax due that has been forgiven in accordance with IPSAS 47.

AG87. If, as a consequence of the terms of an acquisition, a tax authority forgives an amount of the acquirer's tax due, the acquirer shall derecognize those amounts in accordance with the relevant international or national accounting standard dealing with income taxes.

Measuring the Fair Value of Particular Identifiable Assets and a Non-Controlling Interest in an Acquired Operation in an Acquisition (see paragraphs 72–73)

Assets with Uncertain Cash Flows (Valuation Allowances)

AG88. The acquirer shall not recognize a separate valuation allowance as of the acquisition date for assets acquired in an acquisition that are measured at their acquisition-date fair values because the effects of uncertainty about future cash flows are included in the fair value measure. For example, because this Standard requires the acquirer to measure acquired receivables, including loans, at their acquisition-date fair values in accounting for an acquisition, the acquirer does not recognize a separate valuation allowance for the cash flows of the binding arrangement that are deemed to be uncollectible at that date or a loss allowance for expected credit losses.

Assets Subject to Operating Leases in Which the Acquired Operation is the Lessor

AG89. In measuring the acquisition-date fair value of an asset such as a building that is subject to an operating lease in which the acquired operation is the lessor, the acquirer shall take into account the terms of the lease. The acquirer does not recognize a separate asset or liability if the terms of an operating lease are either favorable or unfavorable when compared with market terms.

Assets that the Acquirer Intends not to Use or to Use in a Way that is Different from the Way Other Market Participants Would Use them

AG90. To protect its competitive position, or for security or other reasons, the acquirer may intend not to use an acquired non-financial asset actively, or it may not intend to use the asset according to its highest and best use. For example, that might be the case for an acquired research and development intangible asset that the acquirer plans to use defensively by preventing others from using it. Nevertheless, the acquirer shall measure the fair value of the non-financial asset assuming its highest and best use by market participants in accordance with the appropriate valuation premise, both initially and when measuring fair value less costs of disposal for subsequent impairment testing.

Non-Controlling Interest in an Acquired Operation

AG91. This Standard allows the acquirer to measure a non-controlling interest in the acquired operation at its fair value at the acquisition date. Sometimes an acquirer will be able to measure the acquisition-date fair value of a non-controlling interest on the basis of a quoted price in an active market for the equity shares (i.e., those not held by the acquirer). In other situations, however, a quoted price in an active market for the equity shares will not be available. In those situations, the acquirer would measure the fair value of the non-controlling interest using other measurement techniques.

AG92. The fair values of the acquirer's interest in the acquired operation and the non-controlling interest on a per-share basis might differ. The main difference is likely to be the inclusion of a control premium in the per-share fair value of the acquirer's interest in the acquired operation or, conversely, the inclusion of a discount for lack of control (also referred to as a non-controlling interest discount) in the per-share fair value of the non-controlling interest if market participants would take into account such a premium or discount when pricing the non-controlling interest.

Measuring Goodwill or a Gain from a Bargain Purchase in an Acquisition (see paragraphs 85–98)

Relationship Between Goodwill and Cash Flows (see paragraph 86)

AG93. The acquirer shall recognize goodwill only to the extent that the acquirer estimates there will be favorable changes to its net cash flows, either from increased cash inflows or decreased cash outflows. An acquirer shall not recognize goodwill related to service potential other than cash flows.

Measuring the Acquisition-Date Fair Value of the Acquirer's Interest in the Acquired Operation Using Measurement Techniques (see paragraph 87)

AG94. In an acquisition achieved without the transfer of consideration, the acquirer must substitute the acquisition-date fair value of its interest in the acquired operation for the acquisition-date fair value of the consideration transferred to measure goodwill, a loss or a gain on a bargain purchase (see paragraphs 85–87).

Special Considerations in Applying the Acquisition Method to Combinations of -Mutual Entities (Application of Paragraph 87)

AG95. When two mutual entities combine, the fair value of the equity or member interests in the acquired operation (or the fair value of the acquired operation) may be more reliably measurable than the fair value of the member interests transferred by the acquirer. In that situation, paragraph 87 requires the acquirer to determine the amount of goodwill by using the acquisition-date fair value of the acquired operation's equity interests instead of the acquisition-date fair value of the acquirer's equity interests transferred as consideration. In addition, the acquirer in a combination of mutual entities shall recognize the acquired operation's net assets as a direct addition to capital or equity in its statement of financial position, not as an addition to accumulated surplus or deficit, which is consistent with the way in which other types of entities apply the acquisition method.

AG96. Although they are similar in many ways to other entities, mutual entities have distinct characteristics that arise primarily because their members are both customers and owners. Members of mutual entities generally expect to receive benefits for their membership, often in the form of reduced fees charged for goods and

services or patronage dividends. The portion of patronage dividends allocated to each member is often based on the amount of business the member did with the mutual entity during the year.

AG97. A fair value measurement of a mutual entity should include the assumptions that market participants would make about future member benefits as well as any other relevant assumptions market participants would make about the mutual entity. For example, a present value technique may be used to measure the fair value of a mutual entity. The cash flows used as inputs to the model should be based on the expected cash flows of the mutual entity, which are likely to reflect reductions for member benefits, such as reduced fees charged for goods and services.

Determining what is Part of the Acquisition Transaction (see paragraphs 109–111)

AG98. The acquirer should consider the following factors, which are neither mutually exclusive nor individually conclusive, to determine whether a transaction is part of the exchange for the acquired operation or whether the transaction is separate from the acquisition:

(a) The reasons for the transaction. Understanding the reasons why the parties to the acquisition (the acquirer and the acquired operation and their owners, directors and managers—and their agents) entered into a particular transaction or arrangement may provide insight into whether it is part of the consideration transferred and the assets acquired or liabilities assumed. For example, if a transaction is arranged primarily for the benefit of the acquirer or the combined entity rather than primarily for the benefit of the acquired operation or its former owners before the combination, that portion of the transaction price paid (and any related assets or liabilities) is less likely to be part of the exchange for the acquired operation. Accordingly, the acquirer would account for that portion separately from the acquisition.

(b) Who initiated the transaction. Understanding who initiated the transaction may also provide insight into whether it is part of the exchange for the acquired operation. For example, a transaction or other event that is initiated by the acquirer may be entered into for the purpose of providing future economic benefits to the acquirer or combined entity with little or no benefit received by the acquired operation or its former owners before the combination. On the other hand, a transaction or arrangement initiated by the acquired operation or its former owners is less likely to be for the benefit of the acquirer or the combined entity and more likely to be part of the acquisition transaction.

(c) The timing of the transaction. The timing of the transaction may also provide insight into whether it is part of the exchange for the acquired operation. For example, a transaction between the acquirer and the acquired operation that takes place during the negotiations of the terms of an acquisition may have been entered into in contemplation of the acquisition to provide future economic benefits to the acquirer or the combined entity. If so, the acquired operation or its former owners before the acquisition are likely to receive little or no benefit from the transaction except for benefits they receive as part of the combined entity.

Effective Settlement of a Pre-Existing Relationship between the Acquirer and Acquired Operation in an Acquisition (see paragraph 110(a))

AG99. The acquirer and acquired operation may have a relationship that existed before they contemplated the acquisition, referred to here as a ‘pre-existing relationship’. A pre-existing relationship between the acquirer and acquired operation may arise from a binding arrangement (for example, vendor and customer or licensor and licensee) or may arise outside of a binding arrangement (for example, plaintiff and defendant).

AG100. If the acquisition in effect settles a pre-existing relationship, the acquirer recognizes a gain or loss, measured as follows:

(a) For a pre-existing relationship arising outside of a binding arrangement (such as a lawsuit), fair value.

(b) For a pre-existing relationship arising from a binding arrangement, the lesser of (i) and (ii):

(i) The amount by which the binding arrangement is favorable or unfavorable from the perspective of the acquirer when compared with terms for current market transactions for the same or similar items. (An unfavorable binding arrangement is a binding arrangement that is unfavorable in terms of current market terms. It is not necessarily an onerous binding arrangement in which the unavoidable costs of meeting the obligations under the binding arrangement exceed the economic benefits expected to be received under it.)

(ii) The amount of any stated settlement provisions in the binding arrangement available to the counterparty to whom the binding arrangement is unfavorable.

If (ii) is less than (i), the difference is included as part of the acquisition accounting.

The amount of gain or loss recognized may depend in part on whether the acquirer had previously recognized a related asset or liability, and the reported gain or loss therefore may differ from the amount calculated by applying the above requirements.

AG101. A pre-existing relationship may be a binding arrangement that the acquirer recognizes as a reacquired right. If the binding arrangement includes terms that are favorable or unfavorable when compared with pricing for current market transactions for the same or similar items, the acquirer recognizes, separately from the acquisition, a gain or loss for the effective settlement of the binding arrangement, measured in accordance with paragraph AG100.

Arrangements for Contingent Payments to Employees or Selling Shareholders (see paragraph 110(b))

AG102. Whether arrangements for contingent payments to employees or selling shareholders are contingent consideration in the acquisition or are separate transactions depends on the nature of the arrangements. Understanding the reasons why the acquisition agreement includes a provision for contingent payments, who initiated the arrangement and when the parties entered into the arrangement may be helpful in assessing the nature of the arrangement.

AG103. If it is not clear whether an arrangement for payments to employees or selling shareholders is part of the exchange for the acquired operation or is a transaction separate from the acquisition, the acquirer should consider the following indicators:

(a) Continuing employment. The terms of continuing employment by the selling shareholders who become key employees may be an indicator of the substance of a contingent consideration arrangement. The relevant terms of continuing employment may be included in an employment agreement, acquisition agreement or some other document. A contingent consideration arrangement in which the payments are automatically forfeited if employment terminates is remuneration for post-combination services. Arrangements in which the contingent payments are not affected by employment termination may indicate that the contingent payments are additional consideration rather than remuneration.

(b) Duration of continuing employment. If the period of required employment coincides with or is longer than the contingent payment period, that fact may indicate that the contingent payments are, in substance, remuneration.

(c) Level of remuneration. Situations in which employee remuneration other than the contingent payments is at a reasonable level in comparison with that of other key employees in the combined entity may indicate that the contingent payments are additional consideration rather than remuneration.

(d) Incremental payments to employees. If selling shareholders who do not become employees receive lower contingent payments on a per-share basis than the selling shareholders who become employees

of the combined entity, that fact may indicate that the incremental amount of contingent payments to the selling shareholders who become employees is remuneration.

(e) Number of shares owned. The relative number of shares owned by the selling shareholders who remain as key employees may be an indicator of the substance of the contingent consideration arrangement. For example, if the selling shareholders who owned substantially all of the shares in the acquired operation continue as key employees, that fact may indicate that the arrangement is, in substance, a profit-sharing arrangement intended to provide remuneration for post-combination services. Alternatively, if selling shareholders who continue as key employees owned only a small number of shares of the acquired operation and all selling shareholders receive the same amount of contingent consideration on a per-share basis, that fact may indicate that the contingent payments are additional consideration. The pre-acquisition ownership interests held by parties related to selling shareholders who continue as key employees, such as family members, should also be considered.

(f) Linkage to the valuation. If the initial consideration transferred at the acquisition date is based on the low end of a range established in the valuation of the acquired operation and the contingent formula relates to that valuation approach, that fact may suggest that the contingent payments are additional consideration. Alternatively, if the contingent payment formula is consistent with prior profit-sharing arrangements, that fact may suggest that the substance of the arrangement is to provide remuneration.

(g) Formula for determining consideration. The formula used to determine the contingent payment may be helpful in assessing the substance of the arrangement. For example, if a contingent payment is determined on the basis of a multiple of earnings, that might suggest that the obligation is contingent consideration in the acquisition and that the formula is intended to establish or verify the fair value of the acquired operation. In contrast, a contingent payment that is a specified percentage of earnings might suggest that the obligation to employees is a profit-sharing arrangement to remunerate employees for services rendered.

(h) Other agreements and issues. The terms of other arrangements with selling shareholders (such as agreements not to compete, executory contracts, consulting contracts and property lease agreements) and the income tax treatment of contingent payments may indicate that contingent payments are attributable to something other than consideration for the acquired operation. For example, in connection with the acquisition, the acquirer might enter into a property lease arrangement with a significant selling shareholder. If the lease payments specified in the lease arrangement are significantly below market, some or all of the contingent payments to the lessor (the selling shareholder) required by a separate arrangement for contingent payments might be, in substance, payments for the use of the leased property that the acquirer should recognize separately in its post-combination financial statements. In contrast, if the lease arrangement specifies lease payments that are consistent with market terms for the leased property, the arrangement for contingent payments to the selling shareholder may be contingent consideration in the acquisition.

Acquirer Share-Based Payment Awards Exchanged for Awards Held by the Acquired Operation's Employees (see paragraph 110(b))

AG104. An acquirer may exchange its share-based payment awards for awards held by employees of the acquired operation. The acquirer shall account for -exchanges of share options or other share-based payment awards in conjunction with an acquisition in accordance with the relevant international or -national accounting standard dealing with share-based payments.

AG105. In situations in which acquired operation awards would expire as a consequence of an acquisition and if the acquirer replaces those awards when it is not obliged to do so, the acquirer shall recognize any costs as remuneration cost in the post-combination financial statements in accordance with the relevant international

or national accounting standard dealing with share-based payments. The cost of those awards shall not be included in measuring the consideration transferred in the acquisition.

Equity-Settled Share-Based Payment Transactions of the Acquired Operation

AG106. The acquired operation may have outstanding share-based payment transactions that the acquirer does not exchange for its share-based payment transactions. If vested, those acquired operation share-based payment transactions are part of the non-controlling interest in the acquired operation. If unvested, they are measured as if the acquisition date were the grant date. Share-based payment transactions are measured in accordance with the relevant international or national accounting standard dealing with share-based payments.

Subsequent Measurement and Accounting (see paragraph 112)

AG107. Examples of other IPSAS that provide guidance on subsequently measuring and accounting for assets acquired and liabilities assumed or incurred in an acquisition include:

(a) IPSAS 31 prescribes the accounting for identifiable intangible assets acquired in an acquisition. The acquirer measures goodwill at the amount recognized at the acquisition date less any accumulated impairment losses. IPSAS 26 prescribes the accounting for impairment losses.

(b) IPSAS 35 provides guidance on accounting for changes in a controlling entity's ownership interest in a controlled entity after control is obtained.

AG108. An acquirer should refer to the relevant international or national accounting standards for guidance on subsequently measuring and accounting for insurance contracts, income taxes and share-based payments.

Subsequent Measurement of Transfers, Concessionary Loans and Similar Benefits Received by an Acquirer or Acquired Operation on the Basis of Criteria that May Change as a Result of an Acquisition (see paragraph 114)

AG109. Prior to an acquisition taking place, an acquirer or an acquired operation may receive a transfer from a third party, based on specified criteria. For example, a national government may provide grants to those municipalities where the municipality's revenue per head of population is below a threshold. An acquisition by a municipality of a cash-generating operation may increase the revenue per head of population of the municipality so that it is above the threshold. This may cause the government to review the grant.

AG110. The acquirer shall not account for any revisions to the grant amount as part of the acquisition, but accounts for any revisions at the point the grantor makes its intentions known in accordance with other IPSAS.

AG111. Similar circumstances may arise in respect of concessionary loans and other benefits. The acquirer shall not account for any revisions to those transactions as part of the acquisition, but accounts for any revisions at the point the grantor makes its intentions known in accordance with other IPSAS.

Acquisitions Occurring during a Reporting Period

AG112. The resulting entity meets the needs of the users of its financial statements for information about the acquired operations prior to the acquisition by making the disclosures in paragraph 120(r).

AG113. To satisfy the requirements of a regulator, it may be necessary for the acquirer to present or disclose information in addition to that required by this Standard.

Transitional Provisions for Public Sector Combinations Involving Only Mutual Entities or by Contract Alone (see paragraph 133)

AG114. Paragraph 126 provides that this Standard applies prospectively to public sector combinations for which the acquisition date or amalgamation date is on or after the beginning of the first annual reporting period beginning on or after January 1, 2019. Earlier application is permitted.

AG115. The requirement to apply this Standard prospectively has the following effect for a public sector combination involving only mutual entities or by contract alone if the acquisition date or amalgamation date for that public sector combination is before the application of this Standard:

(a) Classification. An entity shall continue to classify the prior public sector combination in accordance with the entity's previous accounting policies for such combinations.

(b) Previously recognized goodwill. At the beginning of the first annual period in which this Standard is applied, the carrying amount of goodwill arising from the prior public sector combination shall be its carrying amount at that date in accordance with the entity's previous accounting policies. In determining that amount, the entity shall eliminate the carrying amount of any accumulated amortization of that goodwill and the corresponding decrease in goodwill. No other adjustments shall be made to the carrying amount of goodwill.

(c) Goodwill previously recognized as a deduction from equity. The entity's previous accounting policies may have resulted in goodwill arising from the prior public sector combination being recognized as a deduction from equity. In that situation the entity shall not recognize that goodwill as an asset at the beginning of the first annual period in which this Standard is applied. Furthermore, the entity shall not recognize in surplus or deficit any part of that goodwill when it disposes of all or part of the operation to which that goodwill relates or when a cash-generating unit to which the goodwill relates becomes impaired.

(d) Subsequent accounting for goodwill. From the beginning of the first annual period in which this Standard is applied, an entity shall discontinue amortizing goodwill arising from the prior public sector combination and shall test goodwill for impairment in accordance with IPSAS 26.

(e) Previously recognized negative goodwill. An entity that accounted for the prior public sector combination by applying the purchase method may have recognized a deferred credit for an excess of its interest in the net fair value of the acquired operation's identifiable assets and liabilities over the cost of that interest (sometimes called negative goodwill). If so, the entity shall derecognize the carrying amount of that deferred credit at the beginning of the first annual period in which this Standard is applied with a corresponding adjustment to the opening balance of accumulated surplus or deficit at that date.

Appendix B

Amendments to Other IPSAS

[Deleted]

Basis for Conclusions

This Basis for Conclusions accompanies, but is not part of, IPSAS 40.

Objective (paragraph 1)

BC1. In the absence of an International Public Sector Accounting Standard (IPSAS) dealing with public sector combinations, public sector entities are directed, in IPSAS 1, *Presentation of Financial Statements,* to look to other international or national accounting standards. In the case of public sector combinations, they may look to International Financial Reporting Standard (IFRS®) 3, *Business Combinations*. However, IFRS 3 requires all business combinations to be accounted for using acquisition accounting. In developing IFRS 3, the International Accounting Standards Board (IASB®) came to the conclusion that 'true mergers' or 'mergers of equals' in which none of the combining entities obtains control of the others are so rare as to be virtually non-existent. The IASB also observed that respondents and other constituents were unable to suggest an unambiguous and non-arbitrary boundary for distinguishing true mergers or mergers of equals from other business combinations and concluded that developing such an operational boundary would not be feasible (see IFRS 3, BC35). Consequently, the IASB decided that separate accounting requirements for such combinations was not necessary.

BC2. Many consider that in the public sector, mergers or amalgamations are the most common form of combination. As a result, public sector entities may not apply IFRS Standards when accounting for public sector combinations. This means that there may not be consistent or appropriate reporting of such combinations in general purpose financial statements (GPFSs). Consequently, users may not be able to obtain the information needed to identify the type of public sector combination and evaluate its nature and financial effect. The IPSASB believes this Standard will promote consistency and comparability in how public sector combinations are reported by public sector entities.

Process

BC3. In developing this Standard the IPSASB had regard to the discussion of control in IPSAS 35, *Consolidated Financial Statements*. The IPSASB considered how control, as defined in IPSAS 35, should influence the classification of public sector combinations in this Standard. The IPSASB also had regard to the guidance on combinations in the *Government Finance Statistics Manual* 2014 (GFSM 2014) with the aim of avoiding unnecessary differences. The IPSASB also considered IFRS 3 and guidance on combinations developed by national standard setters.

Alignment with Government Finance Statistics (GFS)

BC4. In developing this Standard, the IPSASB had regard to the treatment of public sector combinations in Government Finance Statistics (GFS):

GFS guidelines make a distinction between an acquisition and an amalgamation based on the principle that with an acquisition a transaction occurs, while with an amalgamation just a reclassification of units may occur.

A transaction will occur where a "market unit" is nationalized or privatized (that is, entering government control or leaving it), and the amounts are recorded in GFS as transactions in equity that correspond to the observed transaction price. Any changes in valuation–for example, between the opening balance of a government equity stake and the eventual transaction price–are recorded as revaluation effects, with no impact on government net lending/net borrowing. For amalgamations, the main impact is on the sectorization of the "institutional units".

Where the units before amalgamation belonged to the same sector or subsector of general government, the amalgamation will have no impact on the data for that sector or subsector. For example, an amalgamation

of two local governments, where both are already classified to the local government sector, would not change results for the local government sector.

However, in cases where a unit in one subsector is being amalgamated with a unit in another subsector, the amalgamated units will be removed from the sector they belonged to and be added to the sector of the new amalgamated unit, through a reclassification of the unit (recorded in GFS as an "other volume change in assets and liabilities"). For example, if a local government unit is amalgamated with a state government, the unit will be reclassified from the local government subsector to the state government subsector.

BC5. The IPSASB agreed the approach in GFS was not an appropriate basis for classifying public sector combinations in this Standard, for the following reasons:

(a) The approach in GFS is based on a number of concepts that have no equivalent in IPSAS, for example:

(i) The classification of institutional units into sectors based on their economic nature; and

(ii) The distinction between market producers and nonmarket producers.

(b) Amalgamations in GFS can arise from a reclassification of units without a transaction being recorded, which is inconsistent with the approach in IPSAS; and

(c) Public sector combinations within the same sector or subsector of general government have no impact on the data in GFS, whereas IPSAS would require the changes to individual entities to be accounted for.

BC6. In coming to this conclusion the IPSASB noted that the different approaches in GFS and IPSAS may lead to similar accounting, for example:

(a) Nationalizations are likely to be recorded as acquisitions under both approaches; and

(b) The modified pooling of interests method of accounting will produce similar accounting to the GFS reclassification approach where the combining operations had previously adopted the same accounting policies.

Scope (paragraphs 2–4)

BC7. The IPSASB initially considered developing two Standards on public sector combinations, covering:

(a) Entity combinations arising from exchange transactions—a limited convergence project with IFRS 3; and

(b) Entity combinations arising from non-exchange transactions—a public sector-specific project.

BC8. In May 2009, the IPSASB issued Exposure Draft (ED) 41, *Entity Combinations from Exchange Transactions*, which was the limited convergence project with IFRS 3. Following the consultation process on ED 41, the IPSASB decided not to continue with this approach for the following reasons:

(a) IFRS 3 includes bargain purchases within its scope. It could be argued, therefore, that IFRS 3 also applies to at least some non-exchange entity combinations. The IPSASB acknowledged that it may be difficult to establish a clear demarcation between all exchange and non-exchange entity combinations.

(b) It was not clear whether combinations where no party gains control of the other parties to the combination would be classified as entity combinations arising from exchange transactions, and therefore required to be accounted for as an acquisition in accordance with ED 41.

BC9. Subsequently, the IPSASB decided to develop a single standard dealing with all public sector combinations. This wider scope was included in the Consultation Paper (CP), *Public Sector Combinations*, issued in June 2012. Respondents to the CP supported this wider scope.

BC10. The IPSASB, therefore, decided that this Standard should apply to all public sector combinations, with only limited exceptions. This Standard defines a public sector combination as the bringing together of separate operations into one public sector entity. This definition refers to the bringing together of operations rather than entities, as public sector combinations, in common with business combinations, may involve part of an entity that can be managed separately from the rest of the entity.

BC11. In coming to a decision on the scope of this Standard, the IPSASB agreed to include public sector combinations under common control. While these are excluded from the scope of IFRS 3, the IPSASB considered it important that this Standard included all public sector combinations within its scope.

Scope Exclusions

BC12. The IPSASB agreed that this Standard should not apply to the formation of joint arrangements or joint ventures. The IPSASB stated in the CP that:

> "The concept underlying the formation of a joint venture differs from other combinations, in that the formation arises from separate entities deciding to share control, i.e., they have joint control of the operations that form the joint venture. The concept of joint control may give rise to issues that affect how the joint venture itself should account for its formation."

BC13. In developing this Standard, the IPSASB discussed whether this rationale was still valid given that this Standard takes a different approach to classifying public sector combinations. The IPSASB concluded that the concept of joint control does not reflect the issues addressed in this Standard, and agreed to exclude the formation of joint arrangements or joint ventures from its scope.

BC14. The IPSASB noted that combinations of two or more joint arrangements may occur. The IPSASB considered that, where such a combination results in the formation of a new joint arrangement, this would be outside the scope of IPSAS 40. The IPSASB noted that a combination may result in the acquisition of one or more joint arrangements by another joint arrangement. In such circumstances, the entities that previously had control over the acquired joint arrangements give up that joint control. Such a combination would be an acquisition within the scope of IPSAS 40.

BC15. The IPSASB also agreed to exclude from the scope of this Standard the acquisition by an investment entity of an investment in a controlled entity that is required to be measured at fair value through surplus or deficit. Such transactions are considered to be investments rather than public sector combinations. IPSAS 35 prescribes the accounting requirements for such transactions.

Responses to ED 60, Public Sector Combinations

BC16. The IPSASB issued its proposals in ED 60, *Public Sector Combinations*, in January 2016. Respondents to ED 60 generally supported the proposed scope and the exclusions. The IPSASB considered the responses, and agreed that no changes to the scope were required. In doing so, the IPSASB noted that the scope of the standard included combinations undertaken on a temporary basis, for example the bailout of a private sector company with the intention of selling that company as soon as it was returned to a sound financial position. The IPSASB noted that including such combinations within the scope of this Standard was consistent with the decision taken in developing IPSAS 35 not to require a different accounting treatment for temporarily controlled entities.

Classification of Public Sector Combinations (paragraphs 7–14)

BC17. As a result of the responses it received to ED 41, the IPSASB concluded that distinguishing between entity combinations arising from exchange transactions and entity combinations arising from non-exchange transactions did not provide a suitable basis for a future IPSAS. Relying on the definition of "exchange transactions" in the IPSASB's literature would mean that most government interventions during times of

economic crisis, such as the global financial crisis in 2008, would not meet the definition of an acquisition. The IPSASB considered it inappropriate to define such "bailouts" as amalgamations.

BC18. The IPSASB also noted that IFRS 3 applied to a "business", not to an entity. As well as applying to an entity, the definition of a business could also apply to part of an entity that could be managed separately from the rest of the entity. The IPSASB had regard to these issues in developing its approach in the CP.

Classification Approach in the Consultation Paper, Public Sector Combinations

BC19. The approach taken in the CP was to distinguish between combinations where the parties to the combination are under common control, and combinations where the parties to the combination are not controlled by the same ultimate controlling party, i.e., not under common control. A further distinction was made between combinations where one party gains control of another party (considered by the CP to be acquisitions), and combinations where no party gains control of the other parties to the combination (considered by the CP to be amalgamations).

BC20. The IPSASB considered that the concept of control was important in determining the classification of a public sector combination. Control underpins much of financial reporting. IPSAS 35 requires an entity to consolidate those other entities that it controls, as does the predecessor standard, IPSAS 6, *Consolidated and Separate Financial Statements*. The IPSASB also noted that Government Finance Statistics adopts a similar approach to control as that adopted in both IPSAS 35 and IPSAS 6.

BC21. Similarly, control is an important factor when recognizing assets. Paragraph 5.6 of the *Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities* (the Conceptual Framework) defines an asset as "A resource presently controlled by the entity as a result of a past event."

BC22. The IPSASB determined, therefore, that control was an appropriate starting point for the classification of public sector combinations. As a result, the CP included the IPSASB's preliminary view as to the role of control in classifying public sector combinations:

"The sole definitive criterion for distinguishing an amalgamation from an acquisition is that, in an amalgamation, none of the combining operations gains control of the other operations."

BC23. In developing the CP, the IPSASB explained that the parties to a public sector combination under common control are ultimately controlled by the same entity both before and after the combination. This leads to economic differences between combinations that take place under common control and those that take place not under common control, as follows:

(a) Public sector combinations between entities within an economic entity (i.e., under common control) do not change the economic resources of that economic entity;

(b) Any surpluses and deficits resulting from a public sector combination under common control are eliminated in full in the ultimate controlling entity's consolidated GPFSs; and

(c) The ultimate controlling entity can specify whether any consideration is transferred (and if consideration is transferred, the amount of that consideration) in a public sector combination under common control.

These differences may have implications for the accounting treatment of a public sector combination under common control.

BC24. The approach in the CP reflected the IPSASB's views that:

(a) The economic differences between combinations that take place under common control and those that take place not under common control may have implications for their accounting treatment; and

(b) Acquisitions should be distinguished from amalgamations on the basis of control.

BC25. Similar numbers of respondents to the CP supported and disagreed with the proposals. Respondents who disagreed with the proposals suggested that distinguishing acquisitions from amalgamations based solely on control did not reflect public sector circumstances. In particular, these respondents noted that

(a) Public sector combinations may occur where it is not possible to identify an acquirer even if it is possible to identify an entity that has gained control of operations as a result of the public sector combination. Under IFRS 3, the acquirer can be identified by analyzing the ownership interests in the respective parties. However, in the public sector there may be no quantifiable ownership interests in the entities, making such an analysis impossible. The entity gaining control of the operations may not have existed prior to the combination, and if there are no quantifiable ownership interests in that entity, it will not be possible to identify an acquirer.

(b) Public sector combinations may be imposed on all parties to the combination by a higher level of government, for example when a central government reorganizes local government by legislating the combination of municipalities irrespective of the wishes of those -municipalities.

BC26. Respondents who disagreed with the proposals in the CP suggested a number of alternative bases for classifying public sector combinations, including:

(a) Variations of whether consideration was transferred:

(i) Consideration was transferred as part of the combination;

(ii) Significant consideration was transferred as part of the combination;

(iii) The combination was effected at market value;

(iv) Distinguishing acquisitions (which include the transfer of consideration) not under common control from all other combinations; and

(v) Distinguishing between combinations under common control on the basis of whether the combination has “commercial substance” (which includes the transfer of consideration).

(b) Whether the public sector combination was effected voluntarily or -involuntarily.

Development of the Classification Approach in ED 60, Public Sector Combinations

BC27. The IPSASB considered the responses to the CP. The IPSASB accepted that the classification approach adopted in the CP would not always reflect public sector circumstances. Consequently, the IPSASB agreed to revisit the classification of public sector combinations.

BC28. As part of this process, the IPSASB considered whether any of the approaches suggested by respondents might provide an alternative basis for classification. The IPSASB concluded that these approaches were not suitable, for the following reasons:

(a) The IPSASB came to the view that the transfer of consideration, on its own, was insufficient to distinguish an acquisition from an amalgamation. As noted in paragraph BC17 above, defining an acquisition as an exchange transaction would lead to bailouts being classified as amalgamations. Similarly, if an acquisition was defined as requiring consideration to be transferred by the acquirer, this could lead to bailouts being classified as amalgamations. Definitions of an acquisition that required the transfer of significant consideration, or for the public sector combination to take place at market value, would not address issues such as bargain purchases (discussed above in paragraph BC8(a)).

(b) The IPSASB came to the view that whether a public sector combination was effected voluntarily or involuntarily did not provide, on its own, sufficient information to classify a public sector combination. The voluntary or involuntary nature of a public sector combination provides information as to the process of the combination but not its outcome. Public sector combinations may have different

economic outcomes irrespective of their voluntary or involuntary nature. The IPSASB did not consider that it was possible to classify a public sector combination without considering the outcome of that combination. Consequently, the IPSASB did not consider a classification based solely on the voluntary or involuntary nature of the public sector combination would meet the objectives of financial reporting.

BC29. The IPSASB reviewed the role of control in classifying public sector combinations, and concluded that control remained an important factor in determining whether a combination was an acquisition or an amalgamation. In coming to this conclusion, the IPSASB noted that an acquisition could only occur when a party to the combination gained control of one or more operations (this is discussed in more detail in paragraph BC25(a) above). Consequently, the IPSASB reviewed the factors suggested by respondents to the CP to determine which factors might usefully supplement the concept of control.

BC30. The IPSASB discussed the following factors, and agreed that they could be helpful in supplementing the concept of control in classifying public sector combinations:

(a) **Consideration**. The IPSASB agreed that whether a public sector combination includes the transfer of consideration is relevant to classifying the combination. Acquisitions generally include consideration, whereas consideration will be absent from amalgamations. For the reasons given in paragraph BC28(a) above, the IPSASB agreed that the transfer of consideration in itself was not conclusive, and that more information about the nature of a combination would be obtained by having regard to the reasons why consideration was or was not transferred.

(b) **Exchange transactions**. The IPSASB agreed that an acquisition was more likely to occur in an exchange transaction than in a non-exchange transaction. However, the IPSASB had already acknowledged that it may be difficult to establish a clear demarcation between all exchange and non-exchange entity combinations (see paragraph BC8(a) above). The IPSASB came to the conclusion that information about whether a public sector combination was an exchange transaction or a non-exchange transaction could be determined by having regard to the reasons why consideration was or was not transferred. Consequently, the IPSASB concluded that it is not necessary to assess this factor independently of consideration.

(c) **Quantifiable ownership interests**. The IPSASB noted that whether there are quantifiable ownership interests in an operation can influence the economic substance of a public sector combination. If there are no quantifiable ownership interests in an operation, no consideration can be transferred as there is no party with an entitlement to receive the consideration. This can distinguish the combination from an acquisition, where there is always an owner to receive the consideration. The IPSASB noted that that lack of quantifiable ownership interests could be a reason why consideration was not transferred. Consequently, the IPSASB concluded that it is not necessary to assess this factor independently of consideration.

(d) **Decision-making process**. The IPSASB agreed that having regard to which parties were able to make decisions regarding a public sector combination could provide useful information about the classification of that combination. In the private sector, combinations are usually entered into voluntarily, at least from the acquirer’s perspective. In the public sector, other parties may be involved in the decision-making process. The freedom that the parties to the combination are able to exercise may influence the economic substance of the combination and hence its classification.

(e) **Compulsion**. In the public sector, a public sector combination may be imposed by a higher level of government, whether or not that higher level of government controls the parties to the combination for financial reporting purposes. For example, a central government may restructure local government by directing certain municipalities to combine. The IPSASB agreed that compulsion was relevant to the classification of a public sector combination, but considered that information about compulsion would

be obtained by having regard to decision-making. Consequently, the IPSASB concluded that it is not necessary to assess this factor independently of the decision-making process.

(f) **Common control**. In developing the CP, the IPSASB identified the economic differences between public sector combinations that take place under common control and those that take place not under common control (see paragraph BC23 above). The IPSASB agreed that the ability of the controlling entity to specify whether any consideration is transferred is relevant to the classification of the combination, but considered this to be an element of the decision-making process. The fact that the economic resources of the economic entity do not change in a combination under common control, and that any surpluses or deficits would be eliminated on consolidation were seen as relevant to the controlling entity, but not the controlled entity. As the controlled entity will be the reporting entity for the combination, the IPSASB concluded that it is not necessary to assess this factor independently of the decision-making process.

(g) **Citizens' rights**. In some jurisdictions, citizens may be part of the decision-making process, for example where public sector combinations are subject to the approval of citizens through a referendum. The IPSASB agreed that citizens' rights to accept or reject the combination was relevant to the classification of the combination. However, the IPSASB considered these rights to be rights to participate in the decision-making process. Consequently, the IPSASB concluded that it is not necessary to assess this factor independently of the decision-making process.

BC31. The IPSASB did not consider that the following factors would be helpful in supplementing the concept of control in classifying public sector combinations:

(a) **Change of sector**. The IPSASB acknowledged that a change of sector would be an indicator of a public sector entity acquiring an operation. However, the IPSASB considered that this change of sector would be a consequence of a change in control rather than a separate factor to be considered. The IPSASB also noted that the classification of institutional units into sectors based on their economic nature of being government units was a feature of GFS that had no equivalent in the IPSASB's literature. This will continue to be a significant difference between macroeconomic statistical reporting and accounting and financial reporting. Consequently, the IPSASB did not consider a change of sector to be a useful factor in classifying public sector combinations.

(b) **Nature of the jurisdiction**. Some responses to the CP suggested that, in jurisdictions where there is significant interaction or redistribution between the different levels of government, the public sector can be seen as operating as part of a single quasi "group" entity. Such a view could have implications for the classification of public sector combinations. The IPSASB did not consider that from the reporting entity's perspective, the nature of the jurisdiction was relevant to the classification of public sector combinations. A reporting entity could make an assessment of control, consideration and decision-making without reference to a quasi-group entity. The IPSASB noted that the nature of the jurisdiction may form part of the assessment of the nature of the public sector combination, which an entity may need to consider when the analysis of all other factors has produced inconclusive results or does not provide sufficient evidence to determine the appropriate classification of a public sector combination.

(c) **Operation of government**. Some respondents to the CP suggested that the operation of government would be relevant to the classification of public sector combinations. Examples given included:

(i) The existence of a ministerial or other government power enabling the government to direct the entity's governing body to achieve the government's policy objectives;

(ii) Ministerial approval is required for operating budgets; and

(iii) The government has broad discretion, under existing legislation, to appoint or remove a majority of the members of the governing body of the entity.

The IPSASB concluded that the examples were indicators of control or common control rather than suggesting an independent factor. As such, the IPSASB did not consider that the operation of government was relevant to the classification of public sector combinations.

(d) **The entity directs public policy and/or engages in non-market activity mainly financed by public resources**. Some respondents to the CP suggested that control should be supplemented by having regard to whether the entity directs public policy and/or engages in non-market activity mainly financed by public resources. Where this was the case, this would suggest an amalgamation. The IPSASB noted that this approach would require the introduction of new concepts into the IPSASB's literature. For example, non-market activity is a GFS concept that the IPSASB has not adopted. The IPSASB did not consider it appropriate to introduce these concepts in ED 60. Consequently, the IPSASB did not consider that this factor was relevant to the classification of public sector combinations.

(e) **Accountability**. Some respondents suggested that accounting for a public sector combination at fair value provides more information about the effect of that combination, but that this is only useful for accountability purposes where the entity was responsible for the decision to combine. The IPSASB did not consider accountability to be a primary factor in its own right, but acknowledged that the information resulting from the classification of a public sector combination should meet the objectives of financial reporting. In exceptional circumstances, when an analysis of consideration and the decision-making process produces an inconclusive result or does not provide sufficient evidence as to the appropriate classification of a public sector combination, an entity may need to consider other matters, including what information would meet the objectives of financial reporting and satisfy the qualitative characteristics (QCs).

BC32. The IPSASB concluded, therefore, that control should be supplemented by two additional factors–whether consideration was transferred, and the reasons for the presence or absence of consideration; and the decision-making process. These factors are wide ranging, and encompass elements of other factors, as discussed above.

BC33. The IPSASB noted that these factors could be used either to supplement the indicators of control in IPSAS 35, or could be used to supplement the control concept in classifying public sector combinations. The IPSASB debated the merits of these two approaches. The IPSASB noted that using the factors to supplement the indicators of control was likely to result in a classification approach that better satisfied the QC of comparability. However, the IPSASB considered that using the factors to supplement the control concept was likely to produce a classification approach that provided more relevant and faithfully representative information. Using the factors to supplement the control concept was also more likely to address the concerns raised by respondents.

BC34. Respondents to the CP had identified difficulties with distinguishing between acquisitions and amalgamations based solely on control that were unlikely to be fully addressed by further development of the indicators of control. The IPSASB agreed, and concluded that the gaining of control of operations by a party to the combination is an essential element of an acquisition, but is not sufficient in itself to determine whether a combination is an acquisition. Consequently, the IPSASB agreed to develop an approach to classifying public sector combinations that:

(a) Uses the factors to supplement the concept of control; and

(b) Considers control in the context of whether a party to the combination gains control of one or more operations as a result of the combination.

BC35. Having agreed to develop an approach that uses the factors to supplement control, the IPSASB discussed the relative importance to be attached to control and to the other factors in classifying public sector combinations. As part of this discussion, the IPSASB identified the following two approaches:

(a) **Rebuttable presumption approach**. Under this approach, when one party to the combination gains control of an operation, this creates a rebuttable presumption that the combination is an acquisition. This approach gives a strong weighting to the gaining of control, and the analysis of the other factors is focused on whether there is sufficient evidence to rebut this presumption.

(b) **Individual weighting approach.** Under this approach, the weightings given to the gaining of control, consideration and decision-making are a matter for professional judgment based on the individual circumstances of the combination. Preparers would identify which (if any) factors indicate an acquisition and which (if any) factors indicate an amalgamation. Where indicators of both an acquisition and an amalgamation are present, the weighting given to the respective factors by preparers using professional judgment would determine the classification.

BC36. The IPSASB noted that the rebuttable presumption approach provided greater clarity, and better satisfied the QC of comparability. The individual weighting approach was likely to be more subjective in practice. However, the IPSASB acknowledged that the individual weighting approach would enable practitioners to better reflect the economic substance of the combination, and might better meet the QCs of relevance and faithful representation.

BC37. Control was seen by most members as more important in determining the classification than the other factors, and the rebuttable presumption approach reflected this. Consequently, the IPSASB agreed to develop the rebuttable presumption approach.

BC38. In coming to this decision the IPSASB noted that an approach that considered other factors as supplementing control (which better satisfies the QCs of relevance and faithful representation at the expense of comparability) while at the same time incorporating a rebuttable presumption that one party to a combination gaining control of operations gives rise to an acquisition (which better satisfies the QC of comparability at the expense of relevance and faithful representation) is likely to produce an appropriate balance between the QCs.

BC39. The IPSASB also considered the possibility that, in rare circumstances, neither the consideration nor the decision-making indicators would be sufficient to rebut the presumption that a public sector combination was an acquisition even though this classification did not reflect the economic substance of the combination. The IPSASB agreed to require consideration of the -economic substance of the combination when determining whether the presumption should be rebutted. To assist preparers in this determination, ED 60 also required, in these rare circumstances, an assessment as to which classification produces information that best satisfies the objectives of financial reporting and the QCs.

BC40. The IPSASB considered that the most common circumstances in which a public sector combination would be considered an acquisition are:

(a) One party to the combination gains control of an operation and pays consideration that is intended to compensate those with an entitlement to the net assets of the transferred operation for giving up that entitlement.

(b) One party to the combination gains control of an operation from outside the public sector without paying consideration to compensate those with an entitlement to the net assets of the transferred operations.

(c) One party to the combination gains control of an operation from outside the public sector by imposing the combination on the other party.

(d) One party to the combination gains control of an operation from a separate government.

The IPSASB noted that, except in exceptional cases, the classification approach adopted in ED 60 would result in such combinations being classified as acquisitions. This provided reassurance to the IPSASB that the approach adopted was appropriate.

Responses to ED 60

BC41. The IPSASB considered the responses to ED 60. The IPSASB noted that there was substantial support for the overall approach to classifying public sector combinations in the ED.

BC42. Respondents did, however, identify areas where they considered the approach could be improved. The main issues identified were:

(a) Having a rebuttable presumption that was expected to be rebutted significantly more frequently than not was confusing;

(b) The approach was seen as giving too much emphasis to control, with some stakeholders interpreting the ED as requiring the use of the acquisition method in most cases where one party to the combination gained control of operations; and

(c) In many jurisdictions, it will be easier to determine the economic substance of a public sector combination by reference to the indicators (consideration and decision making) than by reference to whether one party to the combination gained control of operations.

BC43. The IPSASB acknowledged these concerns. The IPSASB accepted that rebuttable presumptions are generally expected to be rebutted infrequently, and that the use of this term with an expectation that it would be frequently rebutted may be confusing for preparers. This confusion could result in a preparer classifying a public sector combination as an acquisition when this was not the IPSASB's intention.

BC44. The IPSASB considered that the potential confusion as to how the rebuttable presumption was to be interpreted might explain the concerns of some stakeholders that the acquisition method would be used inappropriately. The IPSASB did not intend that the approach in the ED would require the use of the acquisition method in most cases where one party to the combination gained control of operations. The IPSASB considered that acquisitions would arise in limited circumstances, as can be seen from the list in paragraph BC40 above.

BC45. The IPSASB accepted that, in many jurisdictions, the economic substance of a public sector combination could be more readily determined by reference to the indicators, in particular whether a combination occurred under common control. However, the IPSASB noted that this was not the case for all jurisdictions. The IPSASB noted that control remained a significant factor; in particular, an acquisition can only occur when a party to the combination gains control of one or more operations. The IPSASB also noted that the approach in ED 60 provided a suitable decision framework for ensuring all relevant factors were considered.

BC46. Consequently, the IPSASB agreed to reconsider the way the classification approach is expressed to address these concerns, without changing the substance of the approach. The rebuttable presumption and reference to control was intended to be the first step in the process of determining a classification based on the economic substance of the combination. In creating this first step, the IPSASB did not intend that, once it has been established that one party has gained control, control should be given greater weight than consideration and decision making in determining the economic substance of the combination. The IPSASB accepted that the reference in BC35(a) to the approach giving a strong weighting to the gaining of control could be misleading. Control remains important, as its absence eliminates the possibility of an acquisition, but its significance in determining the economic substance of a particular combination where one party has gained control is a matter of professional judgment. The IPSASB remains of the view that the classification approach in ED 60 was appropriate, and the changes introduced in this Standard are intended to provide greater clarity as to how the approach should be applied. These changes are not intended to produce different classifications from ED 60.

Comparison with IFRS 3

BC47. This Standard is not converged with IFRS 3. IFRS 3 considers all business combinations to be acquisitions, whereas this Standard provides for both amalgamations and acquisitions. The IPSASB considers this difference to be appropriate, for the following reasons:

(a) In developing IFRS 3, the IASB concluded that 'true mergers' or 'mergers of equals' in which none of the combining entities obtains control of the others are so rare as to be virtually non-existent. However, in the public sector, such combinations are common. Developing a Standard that did not address amalgamations would not meet the needs of the users of public sector GPFSs.

(b) IFRS 3 assumes that it is always possible to identify the acquirer, as the businesses to which IFRS 3 applies will always have owners. In the public sector, there may be no quantifiable ownership interests in a public sector entity, which can make it impossible to identify an acquirer. Developing a Standard that does not recognize this situation would not meet the needs of the users of public sector GPFSs.

Accounting for Amalgamations (paragraphs 15–57)

Reasons for Adopting the Modified Pooling of Interests Method of Accounting for Amalgamations

BC48. In developing the CP, the IPSASB identified three methods of accounting for public sector combinations that have either been applied in practice, or discussed. These are:

(a) The acquisition method;

(b) The pooling of interests method, including a possible modification to this method; and

(c) The fresh start method.

BC49. The acquisition method (which is applied by IFRS 3) requires that an acquirer is identified for all combinations. The IPSASB had already concluded that it may not be possible to identify an acquirer for all public sector combinations, and that any combination in which an acquirer could not be identified would be classified as an amalgamation. The IPSASB therefore concluded that the acquisition method of accounting would not be appropriate for amalgamations.

BC50. The pooling of interests method of accounting was previously used in IAS 22, *Business Combinations* (the predecessor standard to IFRS 3). It was intended for application to a combination in which an acquirer cannot be identified. The pooling of interests method of accounting was previously used by many jurisdictions as the basis for merger accounting or amalgamation accounting. It continues to be used by many entities when accounting for combinations under common control (which are outside the scope of IFRS 3).

BC51. The pooling of interests method accounts for the combining operations as though they were continuing as before, although now jointly owned and managed. The financial statement items of the combining operations for the period in which the combination occurs, and for any comparative periods disclosed, are included in the financial statements of the resulting entity as if they had been combined from the beginning of the earliest period presented. In other words, the recognition point is the beginning of the earliest period presented, and, consequently, comparative information is restated.

BC52. The IPSASB noted that some are of the view that the requirement to restate comparative information might be onerous and unnecessary. In the CP, the IPSASB consulted on a variation of the pooling of interests method of accounting, described as the modified pooling of interests method of accounting. Under the modified pooling of interests method, the resulting entity combines the items in the statement of financial position as at the date of the amalgamation.

BC53. The third method the IPSASB discussed in the CP was the fresh start method of accounting. In contrast to the pooling of interests method of accounting, the premise of the fresh start method is that the resulting entity

is a new entity (irrespective of whether a new entity is formed) and therefore its history commences on that date. The modified pooling of interests method has a similar effect in practice.

BC54. The fresh start method requires recognition of all of the identifiable assets and liabilities of all the combining operations at fair value as at the date of the combination in the financial statements of the resulting entity. This includes recognizing identifiable assets and liabilities that were not previously recognized by the combining operations. In other words, the fresh start method uses the same recognition and measurement basis as the acquisition method, but applies it to all of the combining operations rather than just acquired operations.

BC55. In developing the CP, the IPSASB came to the conclusion that the pooling of interests method of accounting, the modified pooling of interests method of accounting and the fresh start method of accounting all provided a possible basis for accounting for amalgamations.

BC56. The IPSASB noted that the future cash flows and service potential of the -resulting entity will generally be the same regardless of which method is used to account for the amalgamation. However, the presentation of the financial performance and financial position of the resulting entity differs -significantly depending on the method applied. If preparers are given a free choice of method, this would reduce comparability between entities and over time.

BC57. Supporters of the pooling or modified pooling of interests method of accounting for amalgamations considered that these methods satisfy users' needs:

(a) For information for decision-making purposes; and

(b) To assess the accountability of the resulting entity for its use of -resources.

This is because users of public sector entities' GPFSs use the information to assess how financial resources have been allocated and the financial condition of an entity. This information can be obtained by applying the pooling or modified pooling of interests methods of accounting.

BC58. These methods are seen as satisfying the QCs of relevance and faithful representation, because they reflect the amounts recognized in the financial statements of the combining operations before the amalgamation. The subsequent performance of the resulting entity, and its accountability for the management of those resources, can be assessed on the same basis as was used to assess accountability before the amalgamation.

BC59. The pooling or modified pooling of interests methods of accounting are seen as generally the least costly to apply, because they:

(a) Use the existing carrying amounts of the assets, liabilities, and net -assets/equity of the combining operations; and

(b) Do not require identifying, measuring, and recognizing assets or -liabilities not previously recognized before the amalgamation.

BC60. Supporters of the modified pooling of interests method of accounting consider it to be superior to the pooling of interests method because it portrays the amalgamation as it actually is. This is because it recognizes the assets and liabilities of the combining operations at the date of the amalgamation. Supporters consider this to be a faithful representation of the amalgamation.

BC61. Those who support the use of the modified pooling of interests method acknowledge that the history of the combining operations may help in assessing the performance of the resulting entity. In debating the merits of the different methods, the IPSASB acknowledged that adopting the modified pooling of interests method of accounting without addressing users' needs for historical information may not satisfy the objectives of financial reporting.

BC62. Others consider that the fresh start method of accounting is conceptually -superior to both the pooling of interests method of accounting and its modified version, because the resulting entity is held accountable for the current value of the resources of the combining operations. It also provides more complete information of an amalgamation, because it recognizes the identifiable assets and liabilities of the combining operations, regardless of whether they were recognized prior to the amalgamation.

BC63. Supporters of the fresh start method of accounting consider that it satisfies users' needs:

(a) For information for decision-making purposes; and

(b) To assess the accountability of the resulting entity for its use of -resources.

This is because it enables users to better assess the financial condition of the entity and how the financial resources have been allocated.

BC64. Supporters of the fresh start method of accounting consider that this method is, to a large extent, an extension of the use of fair value in the acquisition method of accounting. Consequently, they argue that if the acquisition method is adopted for acquisitions, there is no reason not to adopt similar accounting for amalgamations.

BC65. In developing the CP, the IPSASB came to the view that the modified pooling of interests method of accounting is the appropriate method to apply, because users' are able to assess the performance and accountability of the resulting entity without the entity having to remeasure its assets and liabilities. Furthermore, it recognizes the amalgamation on the date it takes place. The IPSASB noted that IPSAS permit revaluation to fair value subsequent to initial recognition if a resulting entity considers that this approach would provide more relevant information to users.

BC66. Respondents to the CP generally supported the IPSASB's view that the modified pooling of interests method of accounting is the appropriate method to apply to amalgamations. The IPSASB reconsidered the methods in developing ED 60, and identified no reason to change its previously stated view. The IPSASB therefore agreed that the modified pooling of interests method of accounting should be adopted for amalgamations in ED 60. In coming to this decision, the IPSASB agreed that the modified pooling of interests method of accounting should include appropriate disclosures to ensure that the users of public sector entities' GPFSs had access to the historical information they need.

BC67. Respondents to ED 60 generally agreed that the modified pooling of interests method of accounting is the appropriate method to apply to amalgamations. However, some respondents considered that the pooling of interests method of accounting provided better information, and only supported the modified pooling of interests method for cost/benefit reasons. These respondents considered that, in some circumstances, the benefits of providing prior period information would outweigh the cost of so doing. The IPSASB accepted this view, and agreed that resulting entities should be permitted, but not required, to present prior period information. The IPSASB decided that prior period information should not be restated, as doing so would require the use of a different recognition point, which would reduce comparability.

Exceptions to the Principle that Assets and Liabilities are Recognized and Measured at their Previous Carrying Amount

BC68. The modified pooling of interests method of accounting requires the resulting entity to recognize and measure the assets and liabilities of the combining operations at their previous carrying amounts, subject to the requirement to adjust the carrying amounts to conform to the resulting entity's accounting policies. The effects of all transactions between the combining operations, whether occurring before or after the amalgamation date, are eliminated in preparing the financial statements of the resulting entity.

BC69. The IPSASB considered the circumstances in which the application of these principles would not be appropriate. The IPSASB identified three circumstances in which an exception to the recognition and/or measurement principles would be appropriate:

(a) **Licenses and similar rights previously granted by one combining operation to another combining operation**. A license or similar right may have been granted by one combining operation to another combining operation and recognized as an intangible asset by the -recipient. Applying the general principles would require this transaction to be eliminated. However, the IPSASB considered that, in granting the license or similar right, the recognition criteria for an intangible asset are met. Where internally generated intangible assets are not recognized, this is because of the problems in Identifying whether and when there is an identifiable asset that will generate expected future economic benefits or service potential; and in determining the cost of the asset reliably. Once a license or similar right has been granted to a recipient, this demonstrates that there is an identifiable asset that will generate future economic benefits or service potential. Similarly, the transaction will establish a cost for the asset. Consequently, the recognition criteria for an intangible asset are met. Because of this, the asset is not eliminated when combining operations that have granted and received the license or similar right are part of an amalgamation. The situation is similar to that where a tangible asset is sold by one combining operation to another combining operation. Eliminating the effect of the sale does not eliminate the tangible asset itself, as the asset was previously recognized by the seller. In the case of a license or similar right, eliminating the transaction does not eliminate the intangible asset, as the transaction provides sufficient evidence of the existence of the intangible asset, such that the grantor would itself recognize that intangible asset. The IPSASB noted that in some cases where a combining operation gains control of other operations, the right might be considered as a reacquired right. The IPSASB did not consider that this would warrant a different accounting treatment, and noted that reacquired rights are recognized as intangible assets under the acquisition method. For these reasons, the IPSASB concluded that the asset recognized in respect of a license or similar right previously granted by one combining operation to another should not be eliminated.

(b) **Income taxes**. In the public sector, amalgamations, especially those imposed by a higher level of government, may include tax forgiveness as part of the terms and conditions of the amalgamation. The IPSASB agreed that the resulting entity should recognize any tax items that exist following the amalgamation rather than those that existed prior to the amalgamation. Having considered comments by respondents to ED 60, the IPSASB agreed that there may be cases where any tax forgiveness arises subsequent to the amalgamation, rather than as part of the terms and conditions of the amalgamation. The IPSASB agreed to include provisions dealing with both cases in IPSAS 40.

(c) **Employee benefits**. The IPSASB noted that the assets and liabilities required to be recognized by IPSAS 39, *Employee Benefits*, in respect of a post-employment benefit plan following an amalgamation might differ from the combined carrying amounts of the combining operations' equivalent amounts. As an example, an amalgamation involves five combining operations who are the only participants in a multi-employer defined benefit plan. Prior to the amalgamation, the combining operations have insufficient information to determine each combining operation's proportionate share of the defined benefit obligation, plan assets, and cost associated with the plan. As a result, the combining operations account for the plan as if it is a defined contribution plan. Following the amalgamation, the resulting entity is the only participant in the plan, and is able to determine its defined benefit obligation, plan assets, and cost associated with the plan. It therefore accounts for the plan as a defined benefit plan from the date of the amalgamation. The IPSASB agreed that the resulting entity's opening statement of financial position should include the assets and liabilities measured in accordance with IPSAS 39.

Recognizing and Measuring Components of Net Assets/Equity Arising as a Result of an Amalgamation

BC70. In developing ED 60, the IPSASB noted that a residual amount might arise as a result of an amalgamation. The IPSASB considered how this should be -recognized and measured. The IPSASB agreed that the residual

amount does not reflect the financial performance of the resulting entity, and -concluded that the residual amount should be recognized in the resulting entity's -opening statement of financial position.

BC71. The IPSASB considered the nature of the residual amount. The IPSASB considered that, for amalgamations not under common control, the residual amount represents the past financial performance of the combining operations not included in their transferred net assets/equity. The IPSASB agreed that the residual amount should be included in the resulting entity's opening net assets/equity where the amalgamation takes place not under common control.

BC72. The IPSASB considered that, for amalgamations under common control, the residual amount represents the financial consequences of decisions made by the controlling entity in setting or accepting the terms of the amalgamation. Consequently, the IPSASB agreed that the residual amount should be treated as an ownership contribution or ownership distribution where the amalgamation takes place under common control.

BC73. The IPSASB considered the items that should be included in the residual amount. The IPSASB noted that the modified pooling of interests method of accounting usually recognizes an amalgamation as giving rise to, in substance, a new entity on the date the amalgamation takes place. As the new entity would not have generated other components of net assets/equity such as accumulated surplus or deficit, or revaluation surplus, all items within net assets/equity would be included as part of the residual amount.

BC74. The IPSASB considered that this approach best reflects the conceptual basis of an amalgamation and agreed that all items within net assets/equity at the amalgamation date should be considered to be part of the residual amount. In coming to this view, the IPSASB accepted that this approach may have consequences for some entities. For example, because the residual amount would include any previously recognized revaluation surplus, any future revaluation decreases are more likely to be recognized in surplus or deficit. This is because the previously recognized revaluation surplus would no longer be available to absorb future revaluation decreases.

BC75. Another consequence relates to amalgamations that take place under common control. The resulting entity would recognize a residual amount but the controlling entity would continue to recognize the previous components of net assets/equity in its consolidated financial statements, giving rise to ongoing consolidation adjustments. The IPSASB did not consider that these consequences outweighed the benefits of adopting the conceptual approach.

Responses to ED 60

BC76. Although the majority of respondents to ED 60 supported the IPSASB's approach to the residual amount, a significant minority did not. The main reasons respondents gave for not supporting the proposed treatment of the residual amount were as follows:

(a) Retaining existing reserves better represents the combination, is more transparent and better meets users' needs;

(b) The proposals will result in reliable information on the revaluation reserve being discarded;

(c) For amalgamations under common control, the combining entities may effectively be continuing as one entity rather than as two or more separate entities, as opposed to being a new entity;

(d) Reporting subsequent revaluation losses as an expense risks misrepresenting financial performance in future years;

(e) The proposals will produce ongoing consolidation adjustments where the amalgamation takes place under common control, and the need to prepare these adjustments outweighed the benefits of recognizing a single residual amount; and

(f) The proposals will impact on a wide range of reserves, including those relating to employee benefits, hedging and reserves restricted by legislation, which would be inconsistent with ED 60's requirement that the existing classifications and designations are maintained.

BC77. The IPSASB was persuaded by some of the reasons provided by respondents. In particular the IPSASB acknowledged that the proposals in ED 60 might be internally inconsistent.

BC78. The IPSASB therefore reconsidered the proposal to require all amounts recognized in net assets/equity to be recognized in the residual amount.

BC79. The IPSASB concluded that the most appropriate presentation of net assets/equity would depend on the circumstances of the amalgamation. In an amalgamation not under common control, and where there were no reserves such as those referred to in paragraph BC76(f) above, presenting a single opening balance in net assets/equity could provide faithfully representative information. In an amalgamation under common control, and with reserves such as those referred to in paragraph BC76(f) above, presenting a single opening balance in net assets/equity is unlikely to provide faithfully representative information. In these circumstances, presenting separate components of net assets/equity will provide more relevant and useful information.

BC80. Consequently, the IPSASB decided not to specify which components of net assets/equity should be presented, as preparers will be in the best position to judge the most appropriate treatment. The IPSASB agreed to amend the requirements accordingly.

Measurement Period

BC81. IFRS 3 permits acquirers a period of one year after the acquisition date to complete the accounting for the acquisition. This is to allow the acquirer sufficient time to obtain information to determine the fair value of an acquired operation's assets and liabilities.

BC82. When this Standard was issued, the IPSASB had considered whether such a period was required when accounting for an amalgamation. The modified pooling of interests method does not require assets and liabilities to be restated to fair value at the amalgamation date. However, the IPSASB noted that the combining operations may have different accounting policies, which could result in some assets and liabilities being required to be restated to conform to the resulting entity's accounting policies. For example, the resulting entity may adopt an accounting policy of revaluing certain assets such as property, plant and equipment. If one or more combining operations had previously adopted an accounting policy of measuring such assets at cost, the practical effect of determining the carrying amount of those assets under the revaluation model would be similar to that of determining their fair value. For this reason, the IPSASB agreed that it was appropriate to permit a resulting entity time to obtain the information needed to restate assets and liabilities to conform to its accounting policies. The IPSASB agreed that a period of one year was appropriate. In developing IPSAS 45, *Property, Plant, and Equipment*, the IPSASB noted that these principles are still applicable. In reaching this conclusion, the IPSASB noted that the revaluation model in IPSAS 17 is labeled the current value model in IPSAS 45 and IPSAS 17 referred to cost and fair value, while IPSAS 45 refers to historical cost, current operational value and fair value.

Combining Operations that Have Not Previously Adopted Accrual Basis IPSAS Standards

BC83. In developing this Standard, the IPSASB considered whether it was necessary to include specific provisions to address the situation where one or more combining operations had not previously adopted accrual basis IPSAS Standards. For example, one public sector entity that has previously applied accrual basis IPSAS Standards may be amalgamated with a second public sector entity that has previously applied an alternative accrual basis of accounting. In such circumstances, recognizing and measuring the second public sector

entity's assets and liabilities at their carrying amount may not be consistent with the requirements of accrual basis IPSAS.

BC84. The IPSASB concluded that no separate provisions were required in this Standard. Paragraph 27 of IPSAS 40 requires the resulting entity to adjust the carrying amounts of the identifiable assets and liabilities of the combining operations where required to conform to the resulting entity's accounting policies. The IPSASB considered this requirement to be sufficient to address most circumstances where one or more combining operations had not previously adopted accrual basis IPSAS Standards.

BC85. The IPSASB came to the view that where adjusting the carrying amounts to conform to the resulting entity's accounting policies was insufficient to achieve compliance with accrual basis IPSAS Standards, the resulting entity would be a first-time adopter of accrual basis IPSAS Standards. This could occur where one or more combining operations had previously adopted the cash basis of accounting and had, therefore, not previously recognized certain assets and liabilities. In these circumstances, the resulting entity would apply IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards* in preparing its first post-combination financial statements.

Accounting for Acquisitions (Paragraphs 58–125)

Reasons for Adopting the Acquisition Method of Accounting for Acquisitions

BC86. In developing the CP, the IPSASB did not reach a conclusion as to "whether the use of fair value as the measurement basis, is appropriate for some or all acquisitions in the public sector. This is because the most prevalent types of acquisition occur where operations are acquired for the achievement of objectives relating to the delivery of goods and/or services, instead of generating economic benefits to return to equity holders. Moreover, many acquisitions do not include the transfer of consideration. Some consider that these types of acquisitions are different in nature from business combinations as identified in IFRS 3, because the concept of acquiring an operation directly in exchange for the transfer of consideration is missing." Respondents to the CP generally supported the use of fair value for acquisitions in which consideration was transferred. For acquisitions in which no consideration was transferred, there was broadly equal support for fair value measurement and measurement at carrying amount.

BC87. The arguments developed in the CP reflected the classification approach in the CP. In the CP, the IPSASB proposed that the gaining of control was the sole definitive criterion for distinguishing an amalgamation from an acquisition. The IPSASB has subsequently decided to supplement the gaining of control with two other factors, consideration and decision-making. The IPSASB considers that this will result in fewer public sector combinations being classified as acquisitions than under the approach in the CP. Those public sector combinations that are classified as acquisitions will be similar in nature to the business combinations addressed by IFRS 3.

BC88. Having regard to the revised classification approach that it had agreed to adopt, the IPSASB reconsidered which accounting method would be appropriate for acquisitions. The IPSASB concluded that the acquisition method was appropriate, and agreed to adopt the acquisition method as set out in IFRS 3 as the accounting method for acquisitions in this Standard. This approach was supported by respondents to ED 60.

Differences to the Accounting Treatments in IFRS 3

BC89. IFRS 3 includes accounting treatments that are based on other IFRS Standards for which there is no equivalent IPSAS, for example income taxes and share-based payment. The IPSASB agreed not to include the detailed requirements specified in IFRS 3, but to include references to the relevant international or national accounting standard dealing with the issue.

BC90. The IPSASB considered whether any additional guidance to that provided by IFRS 3 was required. The IPSASB noted that acquisitions in the public sector may include assets and liabilities arising from non-exchange transactions that are not addressed in IFRS 3. Consequently, the IPSASB agreed to include additional guidance on the following non-exchange items:

(a) Tax forgiveness; and

(b) The subsequent measurement of transfers, concessionary loans and similar benefits received by a combining operation on the basis of criteria that may change as a result of an acquisition.

BC91. The IPSASB considered comments from respondents to ED 60 regarding the acquisition method. As a result, the IPSASB agreed to make minor changes to the requirements:

The tax forgiveness requirements have been amended to allow for those cases where tax forgiveness occurs subsequent to the acquisition as well as where it forms part of the terms of the acquisition.

The IPSASB considered whether any additional exemptions to the recognition and measurement principles or any additional guidance on the acquisition method were required. The IPSASB concluded that no further provisions were necessary, as the Board considered that the provisions in this Standard or in other IPSAS were already sufficiently clear.

Acquired Operations that Have Not Previously Adopted Accrual Basis IPSAS

BC92. In developing this Standard, the IPSASB considered whether it was necessary to include specific provisions to address the situation where one or more acquired operations had not previously adopted accrual basis IPSAS. The IPSASB concluded that no separate provisions were required in this Standard. Paragraph 64 of IPSAS 40 requires an acquirer to recognize the identifiable assets acquired, the liabilities assumed and any non-controlling interest in an acquired operation. Paragraph 72 of the Standard requires the acquirer to measure the assets and liabilities acquired at their acquisition-date fair values. Consequently, the acquirer will measure all assets and liabilities in accordance with accrual basis IPSAS, irrespective of the accounting basis previously adopted by an acquired operation.

Fair Value Cannot be Determined

BC93. Respondents to ED 60 commented that, in exceptional circumstances, it may be impracticable for an acquirer to determine the fair value of an item and suggested that the use of the item's previous carrying amount may be an appropriate alternative. The IPSASB considered this suggestion but concluded that using carrying amount may not be appropriate in all instances, particularly if the acquired operation does not apply accrual based IPSAS. The IPSASB agreed that entities should apply the existing requirements in IPSAS. In particular, the IPSASB noted that, in accordance with IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*, applying a requirement is impracticable when the entity cannot apply it after making every reasonable effort to do so. IPSAS 3 provides additional guidance. In such cases, the acquirer would measure the item as of the acquisition date in a manner that is consistent with other IPSAS and the acquirer's accounting policies, and make the disclosures required by other IPSAS. The IPSASB considered that it would be appropriate to measure the item at its previous carrying amount only where that carrying amount is consistent with other IPSAS and the acquirer's accounting policies.

Revision of IPSAS 40 as a result of *Improvements to IPSAS, 2018*

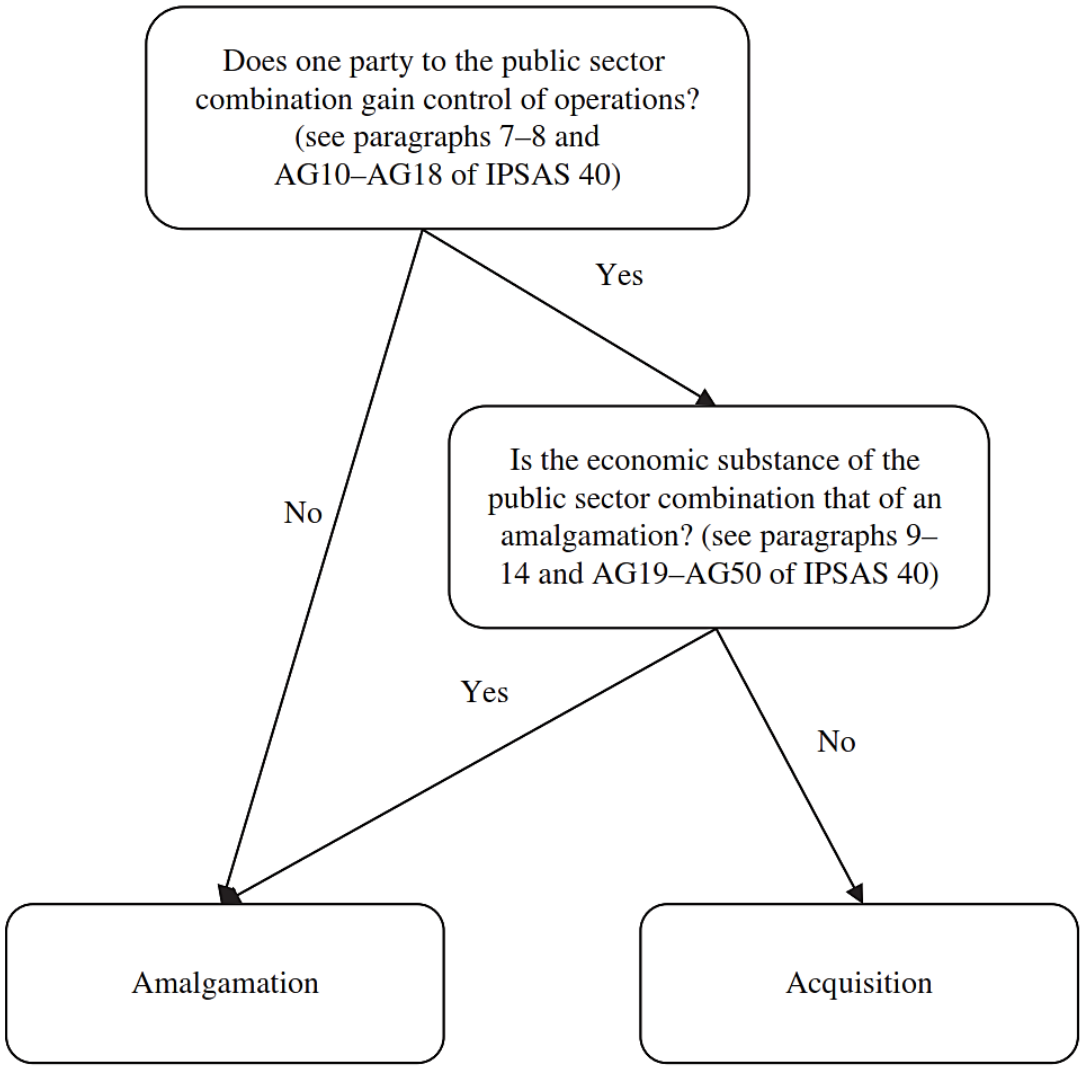
BC94. The IPSASB reviewed the revisions to IFRS 3, *Business Combinations, included in Annual Improvements to IFRS® Standards 2015–2017* Cycle issued by the IASB in December 2017, and the IASB's rationale for making these amendments as set out in its Basis for Conclusions. The IPSASB concurred that, as the accounting for an acquisition achieved in stages was the same in IPSAS 40 as in IFRS 3, there was no public sector specific reason for not adopting the amendments.

Revision of IPSAS 40 as a result of *Improvements to IPSAS, 2019*

BC95. The paragraph related to IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards (IPSAS)* (issued in 2015) was inadvertently omitted when IPSAS 40 was issued. The IPSASB added paragraph 126C to ensure consistency with IPSAS 33.

Revision of IPSAS 40 as a result of Part 3 of *Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* issued in August 2025

BC96. The IPSASB replaced the term ‘valuation techniques’ with the term ‘measurement techniques’ for consistency with the new terminology introduced in IPSAS 46, *Measurement*.



Implementation Guidance

This guidance accompanies, but is not part of, IPSAS 40.

IG1. The purpose of this Implementation Guidance is to illustrate certain aspects of the requirements of IPSAS 40.

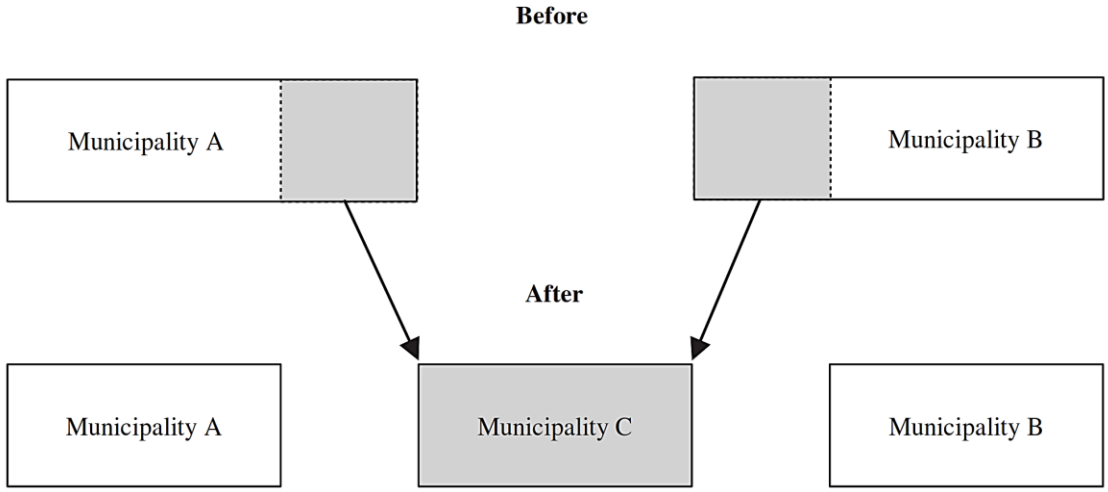
Classification of Public Sector Combinations

IG2. The diagram below summarizes the process established by IPSAS 40 for classifying public sector combinations.

Illustrative Examples

These examples accompany, but are not part of, IPSAS 40.

Classification of Public Sector Combinations



Illustrating the Consequences of Applying Paragraphs 7–14 and AG10–AG50 of IPSAS 40

IE1. The following scenarios illustrate the process for classifying public sector combinations. These scenarios portray hypothetical situations. Although some aspects of the scenarios may be present in actual fact patterns, all facts and circumstances of a particular fact pattern would need to be evaluated when applying IPSAS 40.

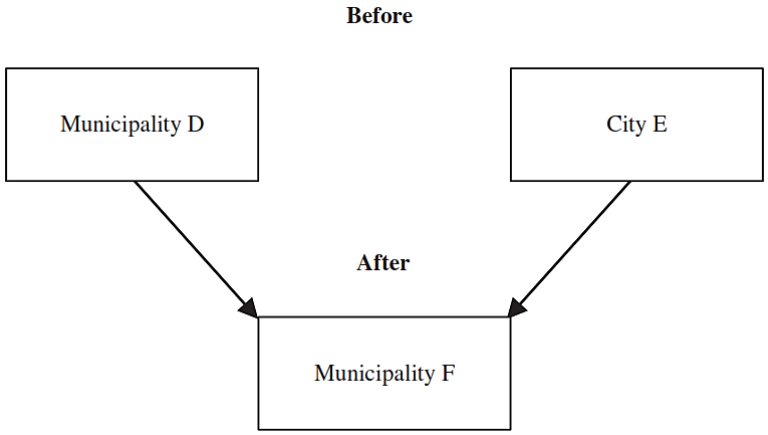
IE2. Each scenario is illustrated by a diagram. Where a public sector combination involves operations which form part of an economic entity, but not the whole economic entity, the operations that are involved in the combination, and the entity that is formed by the combination, are shaded in the diagram. Where more than one reporting entity is included in an economic entity, the boundary of the economic entity is shown by a dotted line.

IE3. The following diagram illustrates the creation of a new municipality by combining some operations from two existing municipalities.

Scenario 1: Reorganization of Local Government by Rearranging Territorial Boundaries

IE4. In this scenario, the territorial boundaries of two existing municipalities, Municipality A and Municipality B, are redrawn by Parliament through legislation; neither Parliament nor Central Government controls Municipality A or Municipality B. Responsibility for part of each municipality's former territory is transferred to a new municipality, Municipality C. Operations in respect of the transferred territory are combined to form Municipality C. A public sector combination occurs.

IE5. Municipality A and Municipality B remain otherwise unchanged and retain their governing bodies. A new governing body (unrelated to the governing bodies of Municipality A and Municipality B) is elected for Municipality C to manage the operations that are transferred from the other municipalities.



IE6. The creation of Municipality C is a public sector combination. In determining whether this should be classified as an amalgamation or an acquisition, the first question to consider is whether one of the parties to the combination has gained control of operations as a result of the combination.

IE7. Municipality C has a newly elected governing body, unrelated to the governing bodies of Municipality A and Municipality B. Neither Municipality A nor Municipality B has power over the Municipality C. Neither do they have exposure, or rights, to variable benefits from any involvement with Municipality C.

IE8. Neither Municipality A nor Municipality B have gained control over Municipality C as a result of the public sector combination. Consequently the combination is classified as an amalgamation.

Scenario 2: Reorganization of Local Government by Combining Municipalities into a New Legal Entity

IE9. The following diagram illustrates the creation of a new municipality by combining all of the operations of two existing municipalities into a new legal entity.

IE10. In this scenario, a public sector combination occurs in which Municipality F is formed to combine the operations (and the related assets, liabilities and components of net assets/equity) of Municipality D and City E. Prior to the combination, Municipality D and City E are not under common control. The combination is imposed by the provincial government (a third party) through legislation. The provincial government has the legal power to direct the two entities to combine, through legislation, even though it does not control them.

IE11. The legislation that creates Municipality F provides for the formation of a new governing body with no links to Municipality D or City E. Municipality D and City E have no role in determining the terms of the combination. After the combination, Municipality D and City E cease to exist.

IE12. The creation of Municipality F is a public sector combination. In determining whether this should be classified as an amalgamation or an acquisition, the first question to consider is whether one of the parties to the combination has gained control of operations as a result of the combination.

IE13. Municipality F has a newly formed governing body, unrelated to the governing bodies of Municipality D and City E. Neither Municipality D nor City E has power over Municipality F. Neither do they have exposure, or rights, to variable benefits from any involvement with Municipality F.

IE14. Neither Municipality D nor City E have gained control over Municipality F as a result of the public sector combination. Consequently the combination is classified as an amalgamation.

Scenario 2: Variation

IE15. In scenario 2, the legislation that creates Municipality F provides for the formation of a new governing body with no links to Municipality D or City E. In this variation, the legislation that creates Municipality F provides for the governing body of Municipality D to become the governing body of Municipality F.

IE16. This suggests that as part of the public sector combination that creates -Municipality F, Municipality D is gaining control of the operations of City E. However, the assessment as to whether Municipality D is gaining

control is based on the substance of the combination, not its legal form. In preparing its first financial statements, Municipality F considers the guidance in paragraphs 7–8 and AG10–AG18 of IPSAS 40.

IE17. In this variation, it is assumed that the legislation that provides for the governing body of Municipality D to become the governing body of Municipality F results in Municipality D gaining:

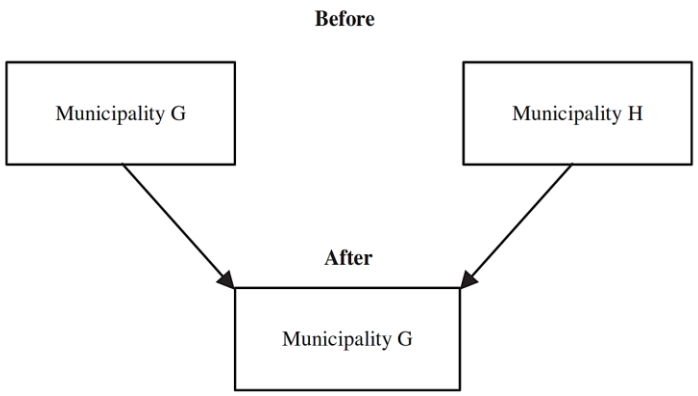
(a) Power over the operations of City E;

(b) Exposure, or rights, to variable benefits from its involvement with those operations; and

(c) The ability to use its power over those operations to affect the nature or amount of the benefits from its involvement with those operations.

IE18. Municipality F concludes that, as a result of the public sector combination, Municipality D has gained control of City E. Municipality F considers the guidance in paragraphs 9–14 and AG19–AG50 of IPSAS 40 in determining whether the economic substance of the combination is that of an amalgamation.

IE19. In considering the economic substance of the public sector combination, -Municipality F notes that the combination does not result in a controlling entity/controlled entity relationship between Municipality D and City E. This is consistent with both an amalgamation and an acquisition. Municipality F also notes that Municipality D obtains access to economic benefits or service potential that are similar to those that could have been obtained by mutual agreement; this may suggest that the economic substance of the combination is that of an acquisition, but is not conclusive.



IE20. In considering the indicators relating to consideration, Municipality F notes that the public sector combination does not include the payment of consideration because there is no party with an entitlement to the net assets of City E (i.e., there are no former owners of City E with quantifiable ownership interests). This suggests that the economic substance of the combination is that of an amalgamation.

IE21. In considering the indicators relating to the decision-making process, -Municipality F notes that the public sector combination was imposed by the provincial government (a third party) and that Municipality D and City E had no role in determining the terms of the combination. This may suggest that the economic substance of the combination is that of an amalgamation.

IE22. Taking these factors together, Municipality F considers that the public sector combination should be classified as an amalgamation. In coming to this decision, Municipality F considers the absence of consideration because there is no party with an entitlement to the net assets of an operation to be the most significant factor in determining the economic substance of the combination.

Scenario 3: Reorganization of Local Government by Combining Municipalities into an Existing Legal Entity

IE23. The following diagram illustrates the combining of all of the operations of two existing municipalities into an existing legal entity.

IE24. In this scenario, a public sector combination occurs in which the operations of Municipality G and Municipality H (and their related assets, liabilities and components of net assets/equity) are combined into the legal entity of Municipality G. Prior to the combination, Municipality G and Municipality H are not under common control. The combination is imposed by Central Government (a third party) through legislation. Central Government has the legal power to direct the two entities to combine, through legislation, even though it does not control them.

IE25. The legislation that effects the combination provides for the governing body of Municipality G to continue as the governing body of the combined entity. Municipality G and Municipality H have no role in determining the terms of the combination. After the public sector combination, Municipality H ceases to exist.

IE26. These facts suggest that as part of the public sector combination, Municipality G is gaining control of the operations of Municipality H. However, the assessment as to whether Municipality G is gaining control is based on the substance of the combination, not its legal form. Municipality G considers the guidance in paragraphs 7–8 and AG10–AG18 of IPSAS 40 in determining whether to classify the combination as an amalgamation or an acquisition.

IE27. In this scenario, it is assumed that the legislation that provides for the governing body of Municipality G to continue as the governing body of combined entity results in Municipality G gaining:

(a) Power over the operations of Municipality H;

(b) Exposure, or rights, to variable benefits from its involvement with those operations; and

(c) The ability to use its power over those operations to affect the nature or amount of the benefits from its involvement with those operations.

IE28. Municipality G concludes that, as a result of the public sector combination, it has gained control of Municipality H. Municipality G considers the guidance in paragraphs 9–14 and AG19–AG50 of IPSAS 40 in determining whether the economic substance of the combination is that of an amalgamation.

IE29. In considering the economic substance of the public sector combination, Municipality G notes that the combination does not result in a controlling entity/controlled entity relationship between Municipality G and Municipality H. This is consistent with both an amalgamation and an -acquisition. Municipality G also notes that it obtains access to economic benefits or service potential that are similar to those that could have been obtained by mutual agreement; this may suggest that the economic substance of the combination is that of an acquisition, but is not conclusive.

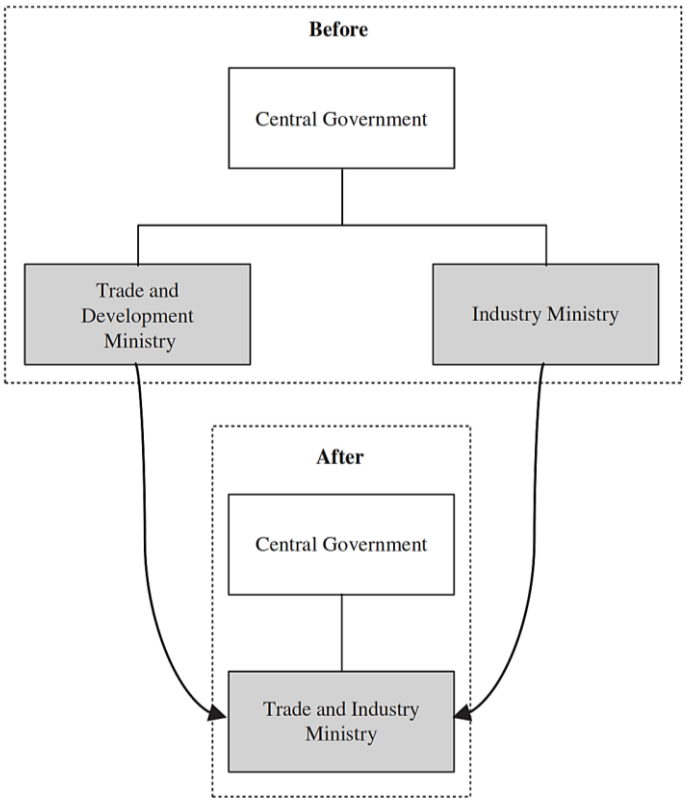
IE30. In considering the indicators relating to consideration, Municipality G notes that the public sector combination does not include the payment of consideration because there is no party with an entitlement to the net assets of Municipality H (i.e., there are no former owners of Municipality H with quantifiable ownership interests). This suggests that the economic substance of the combination is that of an amalgamation.

IE31. In considering the indicators relating to the decision-making process, Municipality G notes that the public sector combination was imposed by Central Government (a third party) and that Municipality G and Municipality H had no role in determining the terms of the combination. This may suggest that the economic substance of the combination is that of an amalgamation.

IE32. Taking these factors together, Municipality G considers that the public sector combination should be classified as an amalgamation. In coming to this decision, Municipality G considers the absence of consideration because there is no party with an entitlement to the net assets of an operation to be the most significant factor in determining the economic substance of the combination.

Scenario 3: Variation

IE33. In scenario 3, the legislation provides for the governing body of Municipality G to become the governing body of the combined entity. In this variation, the legislation provides for a new governing body to be formed that has no links to Municipality G or Municipality H.



IE34. In determining whether this public sector combination should be classified as an amalgamation or an acquisition, the first question to consider is whether one of the parties to the combination has gained control of operations as a result of the combination.

IE35. Despite its legal form continuing, Municipality G has a newly formed governing body, unrelated to its previous governing body or that of Municipality H. Consequently, the previous Municipality G does not gain power over Municipality H. Neither does it have exposure, or rights, to variable benefits from any involvement with Municipality H.

IE36. Municipality G has not gained control over Municipality H as a result of the public sector combination. Consequently the combination is classified as an amalgamation.

Scenario 4: Restructuring of Central Government Ministries

IE37. The following diagram illustrates the reorganization of Central Government ministries by combining the Trade and Development Ministry and the Industry Ministry into the newly formed Trade and Industry Ministry.

IE38. In this scenario, a public sector combination occurs in which the Trade and Industry Ministry is formed to combine the operations (and the related assets, liabilities and components of net assets/equity) of the Trade and Development Ministry and the Industry Ministry. All the ministries, both prior to and after the combination, are controlled by Central Government. The combination is imposed by Central Government using this control. The Trade and Development Ministry and the Industry Ministry have no role in determining the terms of the combination.

IE39. In effecting the combination, Central Government gives responsibility for the new Trade and Industry Ministry to the Minister of Industry and the governing body of the Industry Ministry. After the combination, the Trade and Development Ministry and the Industry Ministry cease to exist.

IE40. As Central Government controls the same operations both before and after the public sector combination, Central Government does not report a combination in its consolidated financial statements. The combination is reported by the Trade and Industry Ministry.

IE41. The creation of the Trade and Industry Ministry is a public sector combination. In determining whether this should be classified as an amalgamation or an acquisition, the first question to consider is whether one of the parties to the combination has gained control of operations as a result of the combination.

IE42. Central Government gives responsibility for the new Trade and Industry Ministry to the Minister of Industry and the governing body of the Industry Ministry. This suggests that as part of the public sector combination that creates the new Trade and Industry Ministry, the Industry Ministry is gaining control of the operations of the Trade and Development Ministry. However, the assessment as to whether the Industry Ministry is gaining control is based on the substance of the combination, not its form. In determining whether the combination should be classified as an amalgamation or an acquisition, the Trade and Industry Ministry considers the guidance in paragraphs 7–8 and AG10–AG18 of IPSAS 40.

IE43. In this scenario, it is assumed that the decision of Central Government to give responsibility for the new Trade and Industry Ministry to the Minister of Industry and the governing body of the Industry Ministry results in the Industry Ministry gaining:

(a) Power over the operations of the Trade and Development Ministry;

(b) Exposure, or rights, to variable benefits from its involvement with those operations; and

(c) The ability to use its power over those operations to affect the nature or amount of the benefits from its involvement with those operations.

IE44. The Trade and Industry Ministry concludes that, as a result of the public sector combination, the Industry Ministry has gained control of the Trade and Development Ministry. The Trade and Industry Ministry considers the guidance in paragraphs 9–14 and AG19–AG50 of IPSAS 40 in determining whether the economic substance of the combination is that of an amalgamation.

IE45. In considering the economic substance of the public sector combination, the Trade and Industry Ministry notes that the combination does not result in a controlling entity/controlled entity relationship between the Trade and -Development Ministry and the Industry Ministry. This is consistent with both an amalgamation and an acquisition. The Trade and Development Ministry also notes that the Industry Ministry obtains access to economic benefits or service potential that are similar to those that could have been obtained by mutual agreement; this may suggest that the economic substance of the combination is that of an acquisition.

IE46. In considering the indicators relating to consideration, the Trade and Industry Ministry notes that the public sector combination does not include the payment of consideration because the combination took place under common control, and Central Government, the controlling entity, did not specify any consideration in the terms of the combination. Consequently, although the absence of consideration may suggest that the economic substance of the combination is that of an amalgamation, this is not of itself conclusive and other factors also need to be taken into account.

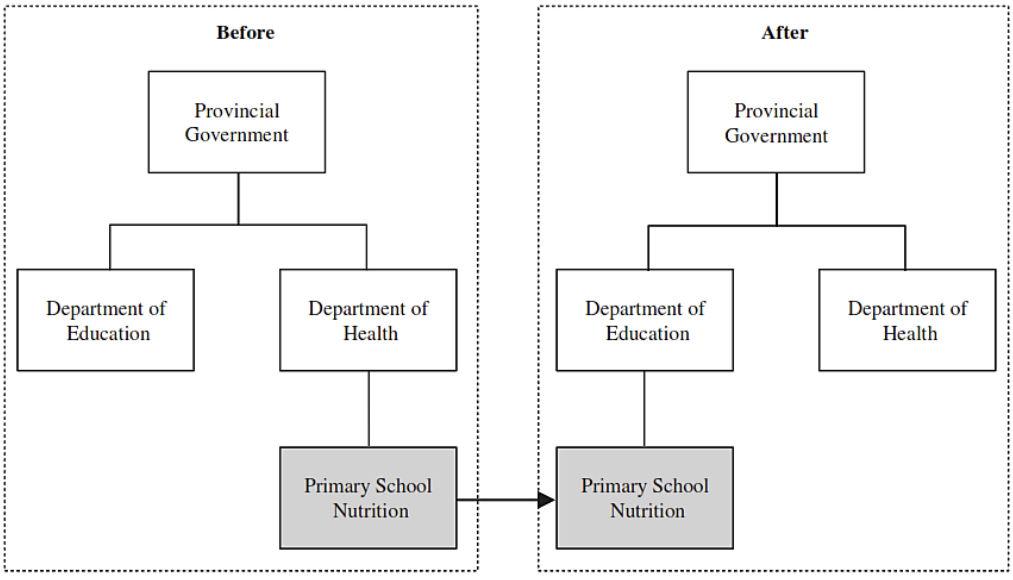
IE47. In considering the indicators relating to the decision-making process, the Trade and Industry Ministry notes that the public sector combination takes place under common control. The combination was directed by Central Government and the Trade and Development Ministry and the Industry Ministry had no role in determining the terms of the combination. This provides evidence that the ultimate decision as to whether the combination took place, and the terms of the combination, are determined by the Central Government,

the controlling entity. This provides evidence that the economic substance of the combination is that of an amalgamation.

IE48. Taking these factors together, the Trade and Industry Ministry considers that the public sector combination should be classified as an amalgamation. In coming to this decision, the fact that the public sector combination takes place under common control is considered to be the most significant factor in determining the economic substance of the combination.

Scenario 4: Variation

IE49. In scenario 4, Central Government gives responsibility for the new Trade and Industry Ministry to the Minister of Industry and the governing body of the Industry Ministry. In this variation, Central Government appoints a new Minister and governing body.



IE50. The creation of the Trade and Industry Ministry is a public sector combination under common control. In determining whether this should be classified as an amalgamation or an acquisition, the first question to consider is whether one of the parties to the combination has gained control of operations as a result of the combination.

IE51. The Trade and Industry Ministry has a new Minister and a newly formed governing body, unrelated to the governing bodies of the Trade and Development Ministry and the Industry Ministry. Neither the Trade and Development Ministry or the Industry Ministry has gained power over the operations of the other ministry. Neither do they have exposure, or rights, to variable benefits from any involvement with the operations of the other ministry.

IE52. Neither of the Trade and Development Ministry nor the Industry Ministry has gained control over the Trade and Industry Ministry as a result of the public sector combination. Consequently the combination is classified as an amalgamation.

Scenario 5: Transfer of Operations Under Common Control

IE53. The following diagram illustrates the transfer of operations between two public sector entities that are under common control.

IE54. In this scenario, a public sector combination occurs in which the Primary School Nutrition operation is transferred from the Provincial Government's Department of Health to its Department of Education. Both departments are controlled by the Provincial Government prior to and after the combination.

IE55. As the Provincial Government controls the same operations both before and after the public sector combination, the Provincial Government does not report a combination in its consolidated financial statements. The combination is reported by the Department of Education.

IE56. The transfer of the Primary School Nutrition operation is a public sector combination. In determining whether this should be classified as an amalgamation or an acquisition, the first question the Department of Education considers is whether one of the parties to the combination has gained control of operations as a result of the combination.

IE57. In this scenario, the Department of Education gains:

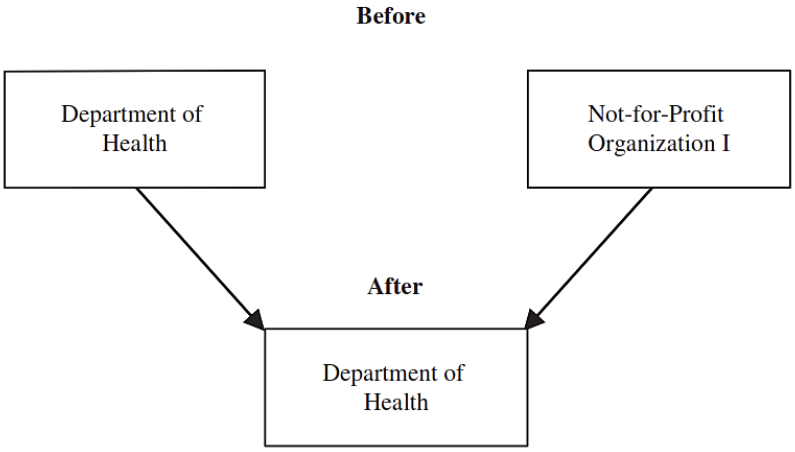
(a) Power over the Primary School Nutrition operation;

(b) Exposure, or rights, to variable benefits from its involvement with that operation; and

(c) The ability to use its power over that operation to affect the nature or amount of the benefits from its involvement with that operation.

IE58. The Department of Education concludes that, as a result of the public sector combination, it has gained control of the Primary School Nutrition operation. The Department of Education considers the guidance in paragraphs 9–14 and AG19–AG50 of IPSAS 40 in determining whether the economic substance of the combination is that of an amalgamation.

IE59. In considering the economic substance of the public sector combination, the Department of Education notes that it obtains access to economic benefits or service potential that are similar to those that could have been obtained in a voluntary transaction; this may suggest that the economic substance of the combination is that of an acquisition.



IE60. In considering the indicators relating to consideration, the Department of Education notes that the public sector combination does not include the payment of consideration because the combination took place under common control, and the Provincial Government, the controlling entity, did not specify any consideration in the terms of the combination. Consequently, although the absence of consideration may suggest that the economic substance of the combination is that of an amalgamation, this is not of itself conclusive and other factors also need to be taken into account.

IE61. In considering the indicators relating to the decision-making process, the -Department of Education notes that the public sector combination takes place under common control. The combination was directed by the Provincial Government. This provides evidence that the ultimate decision as to whether the combination took place, and the terms of the combination, are determined by the Provincial Government, the controlling entity. This provides evidence that the economic substance of the combination is that of an amalgamation.

IE62. Taking these factors together, the Department of Education considers that the public sector combination should be classified as an amalgamation. In coming to this decision, the fact that the public sector combination takes place under common control is considered to be the most significant factor in determining the economic substance of the combination.

Scenario 6: Combination of a Public Sector Entity with a Not-For-Profit Organization

IE63. The following diagram illustrates the combination of a public sector entity with a not-for-profit organization providing similar services.

IE64. In this scenario, a public sector combination occurs in which Not-for-Profit Organization I, a charity which provides paramedic services, voluntarily agrees to combine with the Department of Health in order to improve the delivery of services to the public. The operations of Not-for-Profit Organization I are integrated with similar operations provided by the Department of Health. Prior to the combination, the Department of Health has provided funding for Not-for-Profit Organization I. The Department of Health meets the cost of transferring the title to the assets and liabilities of Not-for-Profit Organization I incurred by the trustees of the charity.

IE65. The combination of the Department of Health and Not-for-Profit Organization I is a public sector combination. In determining whether this should be classified as an amalgamation or an acquisition, the first question the Department of Health considers is whether it has gained control of operations as a result of the combination.

IE66. In this scenario, the Department of Health gains:

(a) Power over Not-for-Profit Organization I and its operations;

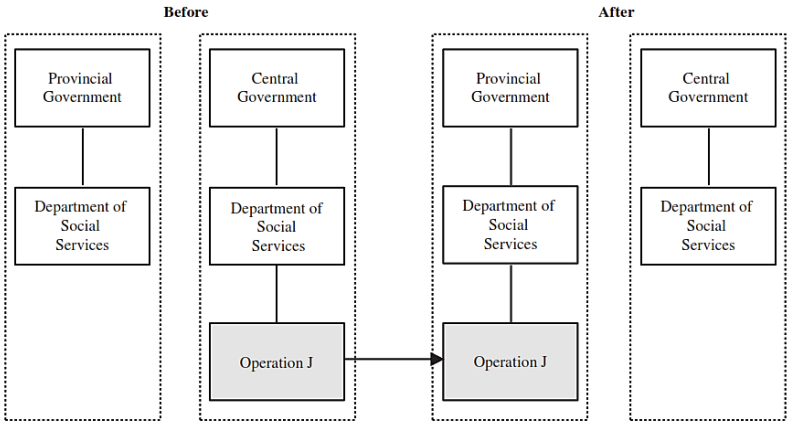
(b) Exposure, or rights, to variable benefits from its involvement with those operations; and

(c) The ability to use its power over those operations to affect the nature or amount of the benefits from its involvement with those operations.

IE67. The Department of Health concludes that, as a result of the public sector combination, it has gained control of Not-for-Profit Organization I. The Department of Health considers the guidance in paragraphs 9–14 and AG19–AG50 of IPSAS 40 in determining whether the economic substance of the combination is that of an amalgamation.

IE68. In considering the economic substance of the public sector combination, the Department of Health notes that the combination does not result in a controlling entity/controlled entity relationship between the Department and Not-for-Profit Organization I. This is consistent with both an amalgamation and an acquisition.

IE69. In considering the indicators relating to consideration, the Department of Health notes that the public sector combination does not include the payment of consideration that is intended to compensate the seller for giving up their entitlement to the net assets of an operation. Although the Department of Health makes a payment to the trustees, this is to compensate them for costs incurred in effecting the combination, not to compensate them for giving up their entitlement to the net assets of Not-for-Profit Organization I. Although Not-for-Profit Organization I has a Board of Trustees, these individuals are not entitled to the net assets of the operation. This means there is no party with an entitlement to the net



assets of Not-for-Profit Organization I (i.e., there are no former owners of Not-for-Profit Organization I with quantifiable ownership interests).This suggests that the economic substance of the combination is that of an amalgamation. In this scenario, this is confirmed by the fact that the purpose of the combination is to improve the delivery of services to the public.

IE70. In considering the indicators relating to the decision-making process, the Department of Health notes that the public sector combination was a voluntary combination. Consequently, these indicators do not provide any evidence to suggest that the economic substance of the combination is that of an amalgamation.

IE71. Taking these factors together, the Department of Health considers that the public sector combination should be classified as an amalgamation. In coming to this decision, the Department of Health considers the absence of consideration because there is no party with an entitlement to the net assets of an operation to be the most significant factor in determining the economic substance of the combination. In this scenario, this view is reinforced by the fact that that Board of Trustees is voluntarily giving up control over the operations to improve the delivery of services to the public.

Scenario 7: Transfer of an Operation Between Levels of Government

IE72. The following diagram illustrates the transfer of an operation between levels of government.

IE73. In this scenario, Central Government adopts a policy of devolving responsibility for some social services to the Provincial Government. Consequently, it proposes transferring Operation J, which provides residential care services, from Central Government's Department of Social Services to the Provincial Government's Department of Social Services. The Provincial Government supports the policy and agrees to accept Operation J. Operation J has net assets of CU1,000[2]. There is no transfer of consideration by the Provincial Government to the Central Government. However, the transfer agreement imposes an obligation on the Provincial Government to continue to provide the residential care services for a minimum of 10 years. Operation J does not recover all its costs from charges; the Provincial Government therefore assumes the responsibility for providing resources to meet the shortfall. Following the transfer, the Provincial Government operates Operation J as a stand-alone entity (i.e., there is a controlling entity/controlled entity relationship between the Provincial Government and Operation J), although it plans to integrate the operation with its other operations at a later date, which would remove the controlling entity/controlled entity relationship.

IE74. The transfer of Operation J is a public sector combination that will need to be reported in both the Provincial Government's financial statements and those of the Provincial Government's Department of Social Services. As the analysis required will be the same for both entities, this example uses the term Provincial Government to refer to both entities.

[2] In these examples monetary amounts are denominated in 'currency units (CU)'

IE75. In determining whether this should be classified as an amalgamation or an acquisition, the first question the Provincial Government considers is whether it has gained control of operations as a result of the combination.

IE76. In this scenario, the Provincial Government gains:

(a) Power over Operation J;

(b) Exposure, or rights, to variable benefits from its involvement with Operation J; and

(c) The ability to use its power over Operation J to affect the nature or amount of the benefits from its involvement with the operation.

IE77. The Provincial Government concludes that, as a result of the public sector combination, it has gained control of Operation J. The Provincial Government considers the guidance in paragraphs 9–14 and AG19–AG50 of IPSAS 40 in determining whether the economic substance of the combination is that of an amalgamation.

IE78. In considering the economic substance of the public sector combination, the Provincial Government notes that the combination results in a controlling entity/controlled entity relationship between the Provincial Government and Operation J. This is inconsistent with the economic substance of an amalgamation.

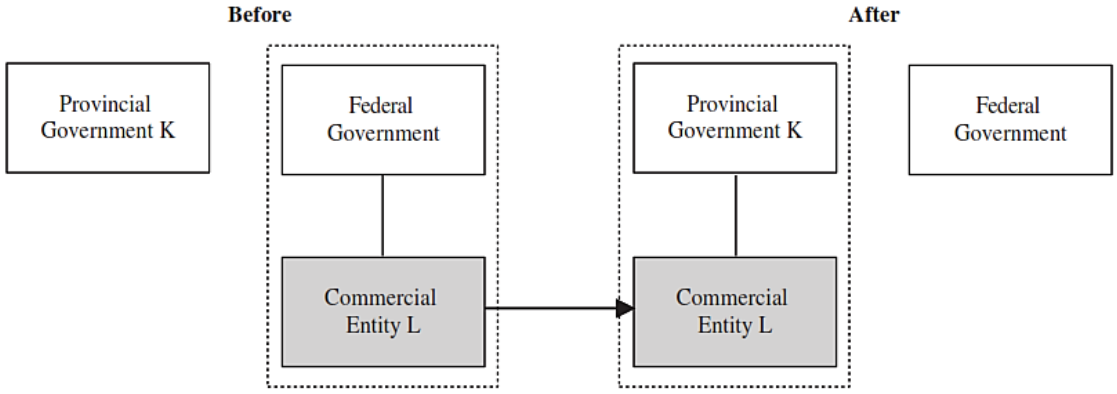
IE79. In considering the indicators relating to consideration, the Provincial Government notes that the public sector combination does not include the payment of consideration that is intended to compensate the seller for giving up their entitlement to the net assets of an operation. However, the transfer agreement requires the Provincial Government to continue to provide the services. As Operation J does not recover all its costs from charges, the Provincial Government will need to provide the necessary resources to cover the shortfall. The Provincial Government considers that the cost of providing services for the agreed 10 year period is likely to be approximately equal to the value of the net assets received. It therefore considers that a market participant would estimate the fair value of Operation J (with the obligation to provide services for 10 years) to be zero. Although no consideration is transferred, this reflects the fair value of the combination. The Provincial Government concludes that the indicators relating to consideration do not provide any evidence to suggest that the economic substance of the combination is that of an amalgamation.

IE80. In considering the indicators relating to the decision-making process, the Provincial Government notes that the public sector combination is a voluntary combination. Consequently, these indicators do not provide any evidence to suggest that the economic substance of the combination is that of an amalgamation.

IE81. Taking these factors together, the Provincial Government concludes that there is no evidence that economic substance of the combination is that of an amalgamation, and that the public sector combination should, therefore, be classified as an acquisition.

Scenario 7: Variation

IE82. In scenario 7, the Provincial Government considers that a market participant would estimate the fair value of Operation J (with the obligation to provide services for 10 years) to be zero. This is the reason that no consideration is paid. In this variation, Operation J is assumed to cover its costs from charges. Consequently, a market participant would estimate the fair value of Operation J (with the obligation to provide services for 10 years) to be greater than zero.



IE83. In these circumstances, the fact that the combination does not include the payment of consideration that is intended to compensate the seller for giving up their entitlement to the net assets of an operation may provide evidence that the economic substance of the combination is that of an amalgamation.

IE84. In determining the classification of the public sector combination, the Provincial Government considers which factor or factors are the most significant. The Provincial Government considers the fact that it has gained control of Operation J and the fact that the combination does not involve the integration of its operations and those of Operation J to be the most significant factors in determining the economic substance of the

combination. This suggests that the combination should be classified as an acquisition. The indicators relating to the decision-making process support this classification; only the indicators relating to consideration suggest that the economic substance of the combination may be an amalgamation. The Provincial Government therefore classifies the combination as an acquisition.

Scenario 8: Transfer of a Commercial Entity between Levels of Government

IE85. The following diagram illustrates the transfer of a commercial entity between levels of government.

IE86. In this scenario, the Federal Government agrees to transfer Commercial Entity L to Provincial Government K. Provincial Government K pays consideration to the Federal Government in respect of the transfer. Following the combination, Provincial Government K operates Commercial Entity L as an arms-length, stand-alone entity.

IE87. The transfer of Commercial Entity L is a public sector combination. In determining whether this should be classified as an amalgamation or an acquisition, the first question Provincial Government K considers is whether it has gained control of operations as a result of the combination.

IE88. In this scenario, Provincial Government K gains:

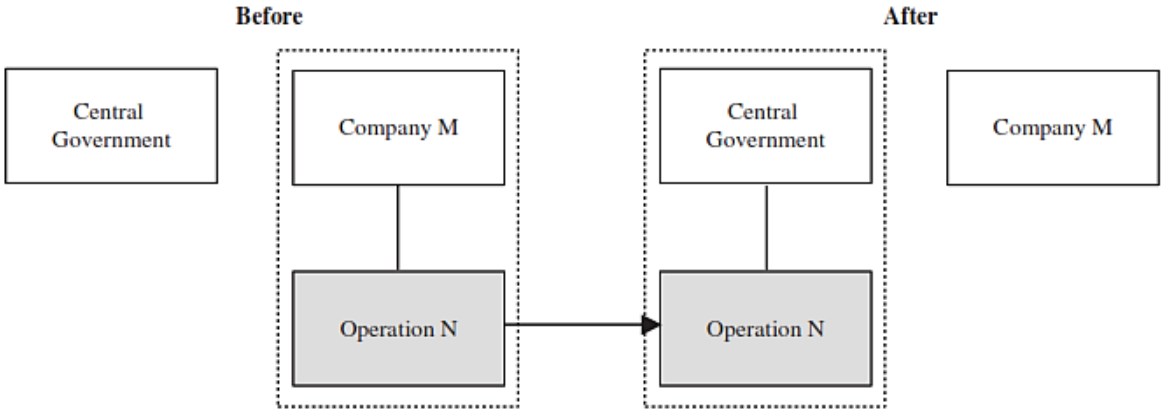
(a) Power over Commercial Entity L and its operations;

(b) Exposure, or rights, to variable benefits from its involvement with those operations; and

(c) The ability to use its power over those operations to affect the nature or amount of the benefits from its involvement with those operations.

IE89. Provincial Government K concludes that, as a result of the public sector combination, it has gained control of Commercial Entity L. Provincial Government K considers the guidance in paragraphs 9–14 and AG19–AG50 of IPSAS 40 in determining whether the economic substance of the combination is that of an amalgamation.

IE90. In considering the economic substance of the public sector combination, Provincial Government K notes that the combination results in a controlling entity/controlled entity relationship between the Provincial Government and Commercial Entity L. This is inconsistent with the economic substance of an amalgamation. Provincial Government K also notes that the combination has commercial substance, which is suggestive of an acquisition.



IE91. In considering the indicators relating to consideration, Provincial Government K notes that the public sector combination includes the payment of consideration that is intended to compensate the seller for giving up their entitlement to the net assets of an operation. Provincial Government K concludes that the indicators relating to consideration do not provide any evidence to suggest that the economic substance of the combination is that of an amalgamation.

IE92. In considering the indicators relating to the decision-making process, Provincial Government K notes that the public sector combination is a voluntary combination. Consequently, these indicators do not provide any evidence to suggest that the economic substance of the combination is that of an -amalgamation.

IE93. Taking these factors together, Provincial Government K concludes that there is no evidence that the economic substance of the combination is that of an amalgamation, and that the public sector combination should, therefore, be classified as an acquisition.

Scenario 9: Purchase of a Private Sector Operation

IE94. The following diagram illustrates the purchase of a private sector operation by a public sector entity.

IE95. In this scenario, Central Government purchases Operation N from Company M. Central Government pays the market value of Operation N, and Company M acts voluntarily. Following the purchase, Operation N is managed as an arms-length, stand-alone entity.

IE96. The purchase of Operation N is a public sector combination. In determining whether this should be classified as an amalgamation or an acquisition, the first question Central Government considers is whether it has gained control of operations as a result of the combination.

IE97. In this scenario, Central Government gains:

(a) Power over Operation N;

(b) Exposure, or rights, to variable benefits from its involvement with -Operation N; and

(c) The ability to use its power over Operation N to affect the nature or amount of the benefits from its involvement with that operation.

IE98. Central Government concludes that, as a result of the public sector -combination, it has gained control of Operation N. Central Government considers the guidance in paragraphs 9–14 and AG19–AG50 of IPSAS 40 in determining whether the economic substance of the combination is that of an amalgamation.

IE99. In considering the economic substance of the public sector combination, Central Government notes that the combination results in a controlling entity/controlled entity relationship between Central Government and Operation N. This is inconsistent with the economic substance of an amalgamation. Central Government also notes that the combination has commercial substance, which is suggestive of an acquisition.

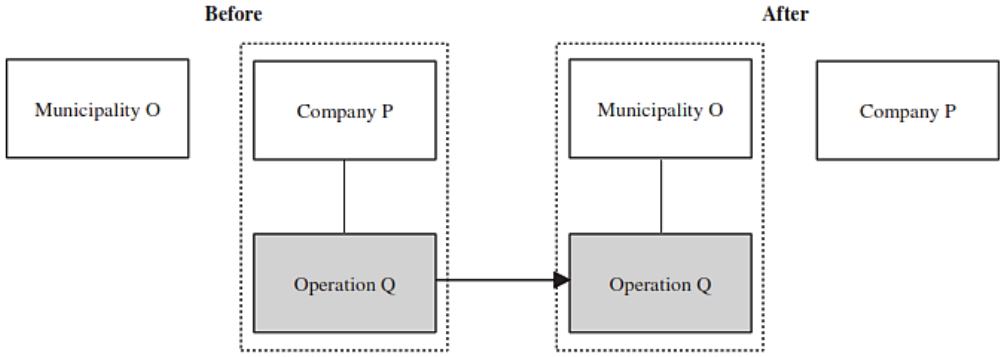
IE100. In considering the indicators relating to consideration, Central Government notes that the public sector combination includes the payment of consideration that is intended to compensate the seller for giving up their entitlement to the net assets of an operation. Central Government concludes that the indicators relating to consideration do not provide any evidence to suggest that the economic substance of the combination is that of an amalgamation.

IE101. In considering the indicators relating to the decision-making process, Central Government notes that the public sector combination is a voluntary combination. Consequently, these indicators do not provide any evidence to suggest that the economic substance of the combination is that of an amalgamation.

IE102. Taking these factors together, Central Government concludes that there is no evidence that the economic substance of the combination is that of an amalgamation, and that the public sector combination should, therefore, be classified as an acquisition.

Scenario 9: Variation

IE103. In scenario 9, Company M enters into the transaction voluntarily. In this variation, Central Government nationalizes Operation N through a compulsory purchase. The purchase is still effected at the market value of Operation N.



IE104. The change from a voluntary transaction to a compulsory purchase does not affect the assessments of control or the indicators related to consideration.

IE105. In considering the indicators relating to the decision-making process, Central Government notes that Company M does not act voluntarily. The fact that Central Government (a party to the combination) is able to impose the public sector combination on Company M provides evidence that the economic substance of the combination is that of an acquisition.

IE106. Consequently, Central Government classifies the public sector combination as an acquisition.

Scenario 10: Bargain Purchase

IE107. The following diagram illustrates a bargain purchase by a public sector entity.

IE108. In this scenario, Municipality O purchases Operation Q from Company P in a bargain purchase. Company P is seeking to sell Operation Q quickly to release cash for its other operations, and is willing to accept a price below the market value of Operation Q for an early sale. In entering into the bargain purchase, Company P acts voluntarily. Following the purchase, Operation Q is managed as an arms-length, stand-alone entity by Municipality O.

IE109. The bargain purchase of Operation Q is a public sector combination. In determining whether this should be classified as an amalgamation or an acquisition, the first question Municipality O considers is whether it has gained control of operations as a result of the combination.

IE110. In this scenario, Municipality O gains:

(a) Power over Operation Q;

(b) Exposure, or rights, to variable benefits from its involvement with Operation Q; and

(c) The ability to use its power over Operation Q to affect the nature or amount of the benefits from its involvement with that operation.

IE111. Municipality O concludes that, as a result of the public sector combination, it has gained control of Operation Q. Municipality O considers the guidance in paragraphs 9–14 and AG19–AG50 of IPSAS 40 in determining whether the economic substance of the combination is that of an amalgamation.

IE112. In considering the economic substance of the public sector combination, Municipality O notes that the combination results in a controlling entity/controlled entity relationship between Municipality O and Operation Q. This is inconsistent with the economic substance of an amalgamation. Municipality O also notes that the combination has commercial substance (even though the price paid was below the market price of Operation Q), which is suggestive of an acquisition.

IE113. In considering the indicators relating to consideration, Municipality O notes that the public sector combination includes the payment of consideration that is intended to compensate the seller for giving up their entitlement to the net assets of an operation, even though that price was below market value. Company P voluntarily accepted a lower price for a quick sale, and the purpose of the consideration paid was to provide Company P with the level of compensation for giving up its entitlement to the net assets of Operation Q that it was willing to accept. Municipality O concludes that the indicators relating to consideration do not provide any evidence to suggest that the economic substance of the combination is that of an amalgamation.

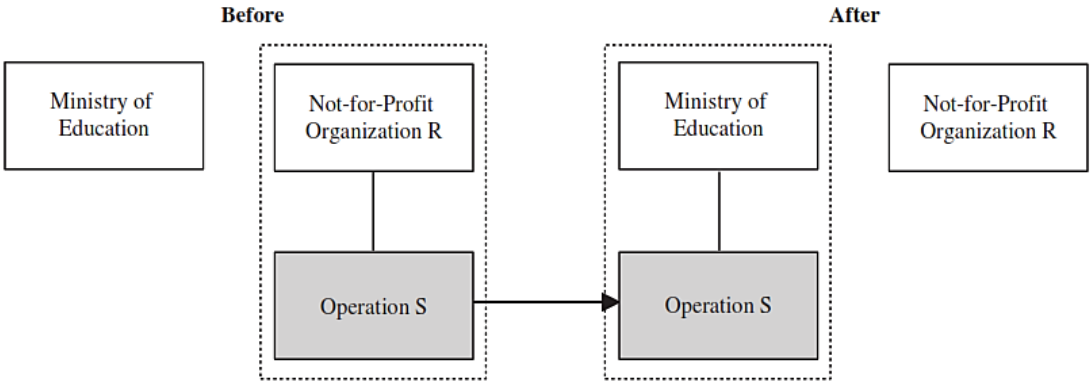
IE114. In considering the indicators relating to the decision-making process, Municipality O notes that the public sector combination is a voluntary combination. Consequently, these indicators do not provide any evidence to suggest that the economic substance of the combination is that of an amalgamation.

IE115. Taking these factors together, Municipality O concludes that there is no evidence that the economic substance of the combination is that of an amalgamation, and that the public sector combination should, therefore, be classified as an acquisition.

Scenario 10: Variation

IE116. In scenario 10, Company P enters into the transaction voluntarily. In this variation, Municipality O seizes Operation Q through a compulsory purchase. The purchase is still effected at a price below the market value of Operation Q. Company P would not have sold Operation Q for a price below market value voluntarily.

IE117. The change from a voluntary transaction to a compulsory purchase does not affect the assessment of control.



IE118. In considering the indicators relating to consideration, Municipality O notes that the public sector combination includes consideration that is intended to compensate the seller for giving up their entitlement to the net assets of an operation. However, the level of compensation is less than Company P would have accepted voluntarily. Consequently, these indicators provide only weak evidence that the economic substance of the combination is that of an acquisition, and greater reliance is placed on other factors.

IE119. In considering the indicators relating to the decision-making process, Municipality O notes that Company P does not act voluntarily. The fact that Municipality O (a party to the combination) is able to impose the public sector combination on Company P provides evidence that the economic substance of the combination is that of an acquisition.

IE120. Taking all the factors into account, Municipality O classifies the public sector combination as an acquisition.

Scenario 11: Donated Operations

IE121. The following diagram illustrates the receipt of a donated operation by a public sector entity.

IE122. In this scenario, Not-for-Profit Organization R, a charity providing education services, voluntarily transfers Operation S, a school, to the Ministry of Education at no cost. Not-for-Profit Organization R does this because it considers that this will result in improved services to the public, and enable it to meet its objectives.

IE123. The donation of Operation S is a public sector combination. In determining whether this should be classified as an amalgamation or an acquisition, the first question the Ministry of Education considers is whether it has gained control of operations as a result of the combination.

IE124. In this scenario, the Ministry of Education gains:

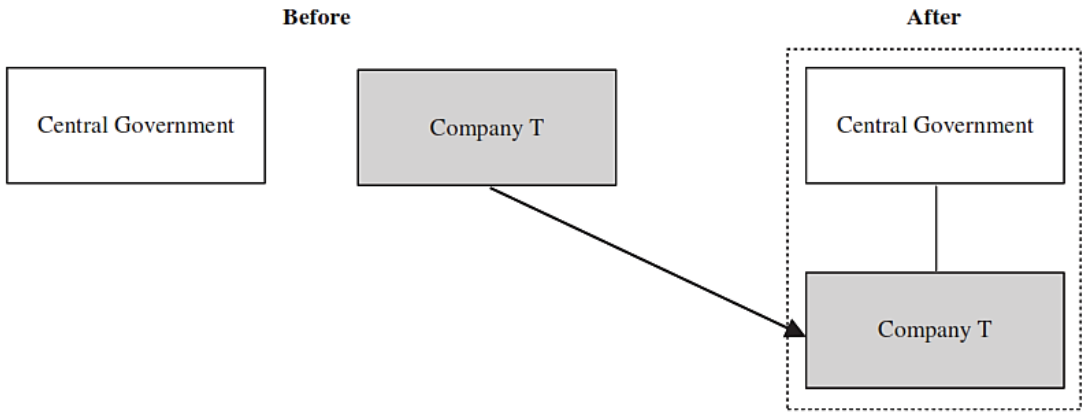
(a) Power over Operation S;

(b) Exposure, or rights, to variable benefits from its involvement with -Operation S; and

(c) The ability to use its power over Operation S to affect the nature or amount of the benefits from its involvement with that operation.

IE125. The Ministry of Education concludes that, as a result of the public sector combination, it has gained control of Operation S. The Ministry of Education considers the guidance in paragraphs 9–14 and AG19–AG50 of IPSAS 40 in determining whether the economic substance of the combination is that of an amalgamation.

IE126. In considering the economic substance of the public sector combination, the Ministry of Education notes that the combination has commercial substance (even though no price was paid for Operation S), which is suggestive of an acquisition.



IE127. In considering the indicators relating to consideration, the Ministry of Education notes that the public sector combination does not include the payment of consideration that is intended to compensate the seller for giving up their entitlement to the net assets of an operation. However, the reason for this is that Not-for-Profit Organization R voluntarily surrendered those rights. The situation is similar to that of a bargain purchase. In a bargain purchase, a seller may be willing to accept a price below market value where this meets their needs, for example in enabling a quick sale. With a donated operation, the former owner is willing to transfer the operation for no consideration to their preferred counterparty. In this scenario, Not-for-Profit Organization R is willing to transfer Operation S to the Ministry of Education because this will provide improved services to the public. Consequently, the Ministry of Education concludes that the indicators of consideration do not provide any evidence to suggest that the economic substance of the combination is that of an amalgamation.

IE128. In considering the indicators relating to the decision-making process, the Ministry of Education notes that the public sector combination is a voluntary combination. Consequently, these indicators do not provide any evidence to suggest that the economic substance of the combination is that of an amalgamation.

IE129. Taking these factors together, the Ministry of Education concludes that there is no evidence that the economic substance of the combination is that of an amalgamation, and that the public sector combination should, therefore, be classified as an acquisition.

Scenario 12: Nationalization of a Private Sector Entity–Forced Seizure

IE130. The following diagram illustrates the nationalization of a private sector entity by a public sector entity by means of a forced seizure.

IE131. In this scenario, Central Government nationalizes Company T through legislation. Central Government does not pay any consideration to the shareholders of Company T. Following the purchase, Company T is managed as an arms-length, stand-alone entity.

IE132. The nationalization of Company T is a public sector combination. In determining whether this should be classified as an amalgamation or an acquisition, the first question Central Government considers is whether it has gained control of operations as a result of the combination.

IE133. In this scenario, Central Government gains:

(a) Power over Company T;

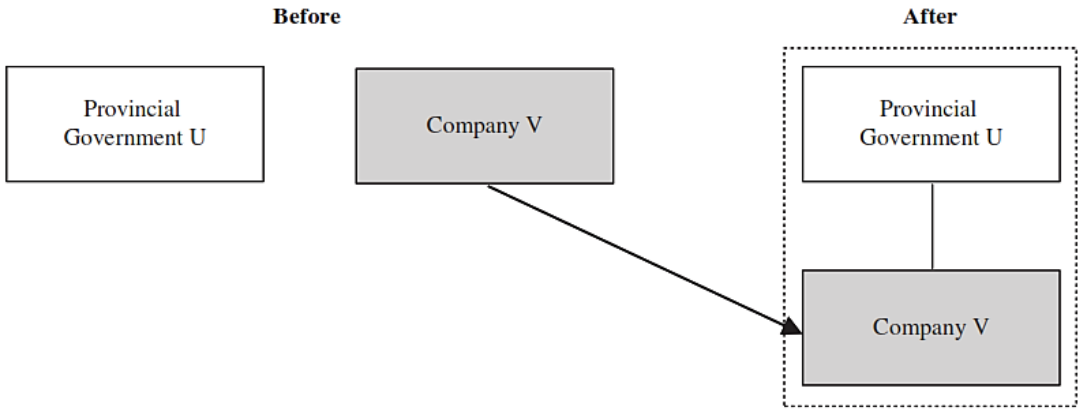
(b) Exposure, or rights, to variable benefits from its involvement with Company T; and

(c) The ability to use its power over Company T to affect the nature or amount of the benefits from its involvement with Company T.

IE134. Central Government concludes that, as a result of the public sector combination, it has gained control of Company T. Central Government considers the guidance in paragraphs 9–14 and AG19–AG50 of IPSAS 40 in determining whether the economic substance of the combination is that of an amalgamation.

IE135. In considering the economic substance of the public sector combination, Central Government notes that the combination results in a controlling entity/controlled entity relationship between Central Government and Company T. This is inconsistent with the economic substance of an amalgamation. Central Government also notes that, by depriving the former shareholders of their rights to Company T, the combination has commercial substance, which is suggestive of an acquisition.

IE136. In considering the indicators relating to consideration, Central Government notes that the public sector combination does not include the payment of consideration that is intended to compensate the seller for giving up their entitlement to the net assets of an operation. However, the former shareholders of Company T have had their entitlements extinguished through compulsion, which provides evidence that the economic substance of the combination is that of an acquisition. Central Government concludes that the indicators



relating to consideration do not provide any evidence to suggest that the economic substance of the combination is that of an amalgamation.

IE137. In considering the indicators relating to the decision-making process, Central Government notes that Company T does not act voluntarily. The fact that Central Government (a party to the combination) is able to impose the public sector combination on Company T provides evidence that the economic substance of the combination is that of an acquisition.

IE138. Taking these factors together, Central Government concludes that there is no evidence that the economic substance of the combination is that of an amalgamation, and that the public sector combination should, therefore, be classified as an acquisition.

Scenario 13: Nationalization of a Private Sector Entity–Bailout

IE139. The following diagram illustrates the nationalization of a private sector entity by a public sector entity by means of a bailout.

IE140. In this scenario, Provincial Government U nationalizes Company V through legislation as a result of a bailout. Prior to the nationalization, Company V was in financial distress. Provincial Government U does not pay any consideration to the shareholders of Company V but does assume Company V's net liabilities. Following the purchase, Company V is managed as an arms-length, stand-alone entity.

IE141. The nationalization of Company V is a public sector combination. In determining whether this should be classified as an amalgamation or an acquisition, the first question Provincial Government U considers is whether it has gained control of operations as a result of the combination.

IE142. In this scenario, Provincial Government U gains:

(a) Power over Company V;

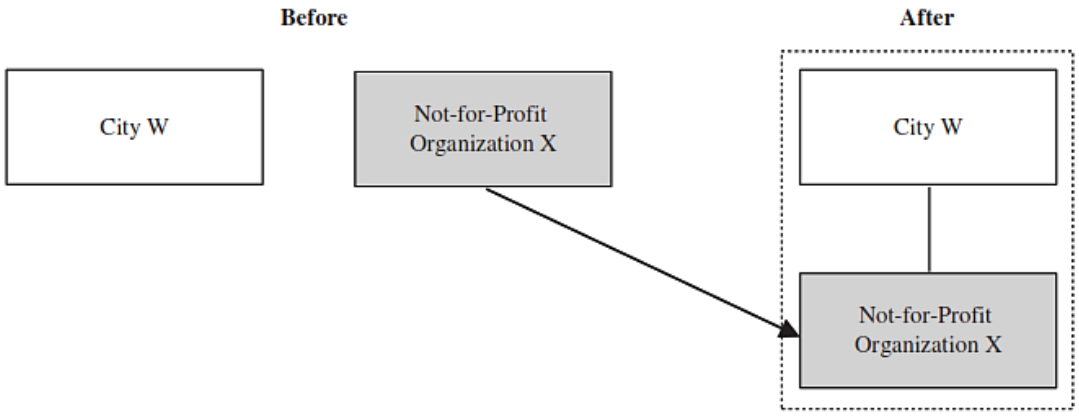
(b) Exposure, or rights, to variable benefits from its involvement with Company V; and

(c) The ability to use its power over Company V to affect the nature or amount of the benefits from its involvement with Company V.

IE143. Provincial Government U concludes that, as a result of the public sector combination, it has gained control of Company V. Provincial Government U considers the guidance in paragraphs 9–14 and AG19–AG50 of IPSAS 40 in determining whether the economic substance of the combination is that of an amalgamation.

IE144. In considering the economic substance of the public sector combination, Provincial Government U notes that the combination results in a controlling entity/controlled entity relationship between Provincial Government U and Company V. This is inconsistent with the economic substance of an amalgamation. Provincial

Government U also notes that, by assuming the net liabilities of Company V, the combination has commercial substance, which is suggestive of an acquisition.



IE145. In considering the indicators relating to consideration, Provincial Government U notes that the public sector combination does not include the payment of consideration that is intended to compensate the seller for giving up their entitlement to the net assets of an operation. However, Company V has net liabilities that are assumed by Provincial Government U as part of the combination. The lack of consideration reflects the fair value of Company V rather than suggesting that the economic substance of the combination is that of an amalgamation. Provincial Government U concludes that the indicators relating to consideration do not provide any evidence to suggest that the economic substance of the combination is that of an amalgamation.

IE146. In considering the indicators relating to the decision-making process, Provincial Government U notes that Company V does not act voluntarily. The fact that Provincial Government U (a party to the combination) is able to impose the public sector combination on Company V provides evidence that the economic substance of the combination is that of an acquisition.

IE147. Taking these factors together, Provincial Government U concludes that there is no evidence that the economic substance of the combination is that of an amalgamation, and that the public sector combination should, therefore, be classified as an acquisition.

Scenario 14: Nationalization of a Not-For-Profit Organization–Bailout

IE148. The following diagram illustrates the nationalization of a not-for-profit organization by a public sector entity by means of a bailout.

IE149. In this scenario, City W nationalizes Not-for-Profit Organization X (a charity) as a result of a voluntary bailout. Prior to the nationalization, Not-for-Profit Organization X was in financial distress and approached City W for support. City W assumes Not-for-Profit Organization X's net liabilities. Following the purchase, Not-for-Profit Organization X is managed as an arms-length, stand-alone entity.

IE150. The nationalization of Not-for-Profit Organization X is a public sector combination. In determining whether this should be classified as an amalgamation or an acquisition, the first question City W considers is whether it has gained control of operations as a result of the combination.

IE151. In this scenario, City W gains:

(a) Power over Not-for-Profit Organization X;

(b) Exposure, or rights, to variable benefits from its involvement with Not-for-Profit Organization X; and

(c) The ability to use its power over Not-for-Profit Organization X to affect the nature or amount of the benefits from its involvement with Not-for-Profit Organization X.

IE152. City W concludes that, as a result of the public sector combination, it has gained control of Not-for-Profit Organization X. City W considers the guidance in paragraphs 9–14 and AG19–AG50 of IPSAS 40 in determining whether the economic substance of the combination is that of an amalgamation.

IE153. In considering the economic substance of the public sector combination, City W notes that the combination results in a controlling entity/controlled entity relationship between City W and Not-for-Profit Organization X. This is inconsistent with the economic substance of an amalgamation. City W also notes that, by assuming the net liabilities of Not-for-Profit Organization X, the combination has commercial substance, which is suggestive of an acquisition.

IE154. In considering the indicators relating to consideration, City W notes that the public sector combination does not include the payment of consideration that is intended to compensate the seller for giving up their entitlement to the net assets of an operation. This is because there is no party with an entitlement to the net assets of Not-for-Profit Organization X (i.e., there is no former owner) as the trustees have no entitlement to the net assets. This would usually provide evidence that the economic substance of the combination is that of an amalgamation. However, in this scenario Not-for-Profit Organization X has net liabilities that are assumed by City W as part of the combination. By assuming the net liabilities, City W relieves the trustees of Not-for-Profit Organization X of the responsibility for settling the liabilities, which is analogous to paying consideration. City W concludes, therefore, that the indicators relating to consideration do not provide any evidence to suggest that the economic substance of the combination is that of an amalgamation.

IE155. In considering the indicators relating to the decision-making process, City W notes that Not-for-Profit Organization X voluntarily initiated the combination. City W concludes that the indicators relating to decision-making do not provide any evidence to suggest that the economic substance of the combination is that of an amalgamation.

IE156. Taking these factors together, City W concludes that there is no evidence that the economic substance of the combination is that of an amalgamation, and that the public sector combination should, therefore, be classified as an acquisition.

Accounting for Amalgamations

Eliminating Transactions between the Combining Operations - Loans

Illustrating the Consequences of Applying Paragraphs 22 and AG51–AG52 of IPSAS 40

IE157. The following example illustrates the process for eliminating a loan between two combining operations not under common control.

IE158. On 30 June 20X5 Resulting Entity (RE) is formed by an amalgamation of two municipalities, Combining Operation A (COA) and Combining Operation B (COB). Four years previously, COA had provided COB with a ten year, fixed interest rate loan of CU250. Interest on the loan is payable annually, with the principal repayable on maturity.

IE159. COB has recently experienced financial difficulties, and at the amalgamation date was in arrears on making the interest payments. The carrying amount of the financial liability (the amortized cost of the loan) in its financial statements at the amalgamation date is CU260.

IE160. Because of the arrears and the fact that COB was experiencing financial difficulties, COA had impaired the loan. The carrying amount of the financial asset (the loan) in its financial statements at the amalgamation date is CU200.

IE161. At the amalgamation date, RE eliminates the financial asset received from COA and the financial liability assumed from COB and credits components of net assets/equity with CU60, the difference between the carrying amounts of the financial asset and the financial liability associated with the loan.

Eliminating Transactions between the Combining Operations - Transfers

Illustrating the Consequences of Applying Paragraphs 22 and AG51–AG52 of IPSAS 40

IE162. The following example illustrates the process for eliminating a transfer between two combining operations not under common control.

IE163. On 30 June 20X9, Resulting Entity (RE) is formed by an amalgamation of two government agencies, Combining Operation A (COA) and Combining Operation B (COB). On 1 January 20X9, COA had entered into a binding arrangement with COB to provide COB with a transfer of CU700 to be used in the provision of an agreed number of training courses (i.e., the compliance obligation).

IE164. The transfer must be returned proportionately to the number of training courses not delivered. Immediately prior to the amalgamation, COB had delivered half of the agreed number of courses, and recognized a liability of CU350 in respect of the unsatisfied portion of its compliance obligation, in accordance with IPSAS 47, *Revenue*. Upon the transfer of funds, COA recognized a transfer right asset for its right to have COB deliver the training courses. Immediately prior to the amalgamation, based on COB's delivery of the courses up to the amalgamation, COA derecognizes CU350 of the transfer right asset and recognizes the amount as a transfer expense.

IE165. At the amalgamation date, the transaction is eliminated. There is no longer an obligation to an external party or an enforceable right to have an external party deliver training courses.

Adjusting the Carrying Amounts of the Identifiable Assets and Liabilities of the Combining Operations to Conform to the Resulting Entity's Accounting Policies in an Amalgamation

Illustrating the Consequences of Applying Paragraphs 26–27 and 36 of IPSAS 40

IE166. The following example illustrates the process for adjusting the carrying amounts of the identifiable assets and liabilities of the combining operations to conform to the resulting entity's accounting policies in an amalgamation under common control.

IE167. On 1 October 20X5 RE is formed by an amalgamation of two government departments, COA and COB. COA has previously adopted an accounting policy of measuring property, plant, and equipment using the historical cost model in IPSAS 45, *Property, Plant, and Equipment*. COB has previously adopted an accounting policy of measuring property, plant, and equipment using the current value model in IPSAS 45.

IE168. RE adopts an accounting policy of measuring property, plant and equipment using the current value model. RE seeks an independent valuation for the items of property, plant and equipment previously controlled by COA.

IE169. On receiving the independent valuation for the items of property, plant, and equipment previously controlled by COA, RE adjusts the carrying amounts of the items of property, plant, and equipment as follows, with the corresponding entry being made to components of net assets/equity:

Class of Asset	Carrying Amount (CU)	Valuation (CU)	Adjustment (CU)
Land	17,623	18,410	787
Buildings	35,662	37,140	1,478
Vehicles	1,723	1,605	(118)

IE170. RE also reviews the carrying amounts of the items of property, plant, and equipment previously controlled by COB to ensure the amounts are up to date as at 1 October 20X5. The review confirms the carrying amounts

of the items of property, plant, and equipment previously controlled by COB are up to date and that no adjustment is required.

IE171. RE recognizes the items of property, plant, and equipment previously controlled by COB at their carrying amounts. In accordance with paragraph 48 of IPSAS 45, RE will review the residual values and useful lives of the plant and equipment previously controlled by both COA and COB at least at each annual reporting date. If expectations differ from previous estimates, RE will account for these changes as changes in accounting estimates, in accordance with IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*.

Forgiveness of Amounts of Tax Due in an Amalgamation

Illustrating the Consequences of Accounting for Tax Forgiveness in an Amalgamation by Applying Paragraphs 33–34 and AG57–AG58 of IPSAS 40

IE172. The following example illustrates the accounting for an amalgamation not under common control in which the resulting entity's tax liability is forgiven as part of the terms of the amalgamation.

IE173. On 1 January 20X6 RE is formed by an amalgamation of two public sector entities, COA and COB. The amalgamation is directed by the national government. RE, COA and COB have the same accounting policies; no adjustment to the carrying amounts of the identifiable assets and liabilities of the COA and COB to conform to the resulting entity's accounting policies is required. At the date of the amalgamation, there are no amounts outstanding between COA and COB.

IE174. In its statement of financial position as at 1 January 20X6, RE recognizes and measures the assets and liabilities of COA and COB at their carrying amounts in their respective financial statements as of the amalgamation date:

Statement of Financial Position:	**COA (CU)**	**COB (CU)**	**RE (CU)**
Financial assets	1,205	997	2,202
Inventory	25	42	67
Property, plant and equipment	21,944	18,061	40,005
Identifiable intangible assets	0	3,041	3,041
Financial liabilities	(22,916)	(22,020)	(44,936)
Tax liabilities	(76)	(119)	(195)
Total net assets	182	2	184
Net Assets/Equity	182	2	184

IE175. Suppose that the terms of the amalgamation include the Ministry of Finance (MF) (the tax authority) forgiving RE's tax liability. RE would derecognize the tax liability and make the adjustment to net assets/equity. The statement of financial position as at 1 January 20X6 for RE would be as follows:

Statement of Financial Position:	**RE (CU)**
Financial assets	2,202
Inventory	67
Property, plant and equipment	40,005
Intangible assets	3,041
Financial liabilities	(44,936)
Tax liabilities	0

Total net assets	379
Net Assets/Equity	379

IE176. MF accounts for tax receivable in accordance with IPSAS 47, and would recognize an adjustment for the tax forgiven.

Recognizing and Measuring Components of Net Assets/Equity Arising as a Result of an Amalgamation

Illustrating the Consequences of Applying Paragraphs 37–39 of IPSAS 40

IE177. The following example illustrates the accounting for recognizing and measuring components of net assets/equity in an amalgamation.

IE178. On 1 June 20X4, a new municipality RE is formed by the amalgamation of operations COA and COB relating to two geographical areas of other municipalities, not previously under common control.

IE179. COB has previously performed services for COA for which it was to be paid CU750. Payment was outstanding at the amalgamation date. This transaction formed part of the carrying amount of financial liabilities for COA and part of the carrying amount of financial assets for COB.

IE180. COA has previously adopted an accounting policy of measuring property, plant, and equipment using the historical cost model. COB has previously adopted an accounting policy of measuring property, plant and equipment using the current value model. RE has adopted an accounting policy of measuring property, plant, and equipment using the current value model. RE obtains an independent valuation for the items of property, plant, and equipment previously controlled by COA. As a result, it increases its carrying amount for those items of the property, plant, and equipment by CU5,750 and makes the corresponding adjustment to components of net assets/equity.

IE181. The carrying amounts of the assets, liabilities and components of net assets/equity transferred are summarized below. Adjustments to eliminate transactions between COA and COB (see paragraph 22), and to conform the carrying amounts to the resulting entity›s accounting policies are also shown.

	COA (CU)	COB (CU)	Elimination Adjustments (CU)	Accounting Policy Adjustments (CU)	RE Opening Balance (CU)
Financial Assets	11,248	17,311	(750)		27,809
Inventory	1,072	532			1,604
Property, plant and equipment	5,663	12,171		5,750	23,584
Intangible assets	0	137			137
Financial liabilities	(18,798)	(20,553)	750		(38,601)
Total net assets/ (liabilities)	(815)	9,598		5,750	14,533
Revaluation surplus	0	6,939		5,750	12,689
Accumulated surpluses or deficits	(815)	2,659			1,844
Total net assets/equity	(815)	9,598	0	5,750	14,533

IE182. In accordance with paragraphs 37–39 of IPSAS 40, RE may present net assets/equity as either a single opening balance of CU14,533 or as the separate components shown above.

IE183. The other municipalities that, prior to the amalgamation, controlled COA and COB would derecognize the assets, liabilities and components of net assets/equity transferred to RE in accordance with other IPSAS.

Measurement Period in an Amalgamation

Illustrating the Consequences of Applying Paragraphs 40–44 of IPSAS 40.

IE184. If the initial accounting for an amalgamation is not complete at the end of the financial reporting period in which the amalgamation occurs, paragraph 40 of IPSAS 40 requires the resulting entity to recognize in its financial statements provisional amounts for the items for which the accounting is incomplete. During the measurement period, the resulting entity recognizes adjustments to the provisional amounts needed to reflect new information obtained about facts and circumstances that existed as of the amalgamation date and, if known, would have affected the measurement of the amounts recognized as of that date. Paragraph 43 of IPSAS 40 requires the resulting entity to recognize such adjustments as if the accounting for the amalgamation had been completed at the amalgamation date. Measurement period adjustments are not included in surplus or deficit.

IE185. Suppose that RE is formed by the amalgamation of COA and COB (two municipalities that were not under common control prior to the amalgamation) on 30 November 20X3. Prior to the amalgamation, COA had an accounting policy of using the current value model for measuring land and buildings, whereas COB's accounting policy was to measure land and buildings using the historical cost model. RE adopts an accounting policy of measuring land and buildings using the current value model, and seeks an independent valuation for the land and buildings previously controlled by COB. This valuation was not complete by the time RE authorized for issue its financial statements for the year ended 31 December 20X3. In its 20X3 annual financial statements, RE recognized provisional values for the land and buildings of CU150,000 and CU275,000 respectively. At the amalgamation date, the buildings had a remaining useful life of fifteen years. The land had an indefinite life. Four months after the amalgamation date, RE received the independent valuation, which estimated the amalgamation-date value of the land as CU160,000 and the amalgamation-date value of the buildings as CU365,000.

IE186. In its financial statements for the year ended 31 December 20X4, RE retrospectively adjusts the 20X3 prior year information as follows:

(a) The carrying amount of the land as of 31 December 20X3 is increased by CU10,000. As the land has an indefinite life, no depreciation is charged.

(b) The carrying amount of the buildings as of 31 December 20X3 is increased by CU89,500. That adjustment is measured as the valuation adjustment at the amalgamation date of CU90,000 less the additional depreciation that would have been recognized if the asset's value at the amalgamation date had been recognized from that date (CU500 for one months' depreciation).

(c) An adjustment of CU100,000 is recognized in net assets/equity as of 31 December 20X3.

(d) Depreciation expense for 20X3 is increased by CU500.

IE187. In accordance with paragraph 56 of IPSAS 40, RE discloses:

(a) In its 20X3 financial statements, that the initial accounting for the amalgamation has not been completed because the valuation of land and buildings previously controlled by COB has not yet been received.

(b) In its 20X4 financial statements, the amounts and explanations of the adjustments to the provisional values recognized during the current reporting period. Therefore, RE discloses that the 20X3 comparative information is adjusted retrospectively to increase the value of the land and buildings by

CU99,500 (CU100,000 at the amalgamation date), an increase in depreciation expense of CU500 and an increase in net assets/equity of CU100,000.

Subsequent Measurement of a Transfer Received by a Combining Operation on the Basis of Criteria that May Change as a Result of an Amalgamation

Illustrating the Consequences of Applying the Requirements in Paragraphs 48 and AG61–AG63 of IPSAS 40.

IE188. The following example illustrates the subsequent accounting for a transfer received by a combining operation on the basis of criteria that may change as a result of an amalgamation.

IE189. On 1 January 20X3, a national government provides an annual grant to those municipalities where the average household income is below a threshold. On 1 June 20X3, RE, a new municipality, is formed by the amalgamation of two existing municipalities, COA and COB. COA had previously received a grant of CU1,000, based on its average household income. COB has received no grant as its average household income was above the threshold.

IE190. Following the amalgamation on 1 June 20X3, the average household income of RE is above the threshold that the government had set when allocating grants.

IE191. On 1 July 20X3, the national government requires RE to repay a portion (CU200) of the grant previously paid to COA. RE recognizes a liability and an expense of CU200 on 1 July 20X3.

Disclosure Requirements Relating to Amalgamations

Illustrating the Consequences of Applying the Disclosure Requirements in Paragraphs 53–57 of IPSAS 40.

IE192. The following example illustrates some of the disclosure requirements relating to amalgamations of IPSAS 40; it is not based on an actual transaction. The example assumes that RE is a newly created municipality formed by amalgamating the former municipalities COA and COB. The illustration presents the disclosures in a tabular format that refers to the specific disclosure requirements illustrated. An actual footnote might present many of the disclosures illustrated in a simple narrative format.

Paragraph reference	
54(a)–(c)	On 30 June 20X2 RE was formed by an amalgamation of the former municipalities COA and COB. Neither COA nor COB gained control of RE in the amalgamation. The amalgamation was mutually agreed by COA and COB, and enacted by the Government through legislation. The amalgamation aims to reduce costs through economies of scale, and to provide improved services to residents.
54(d)	**Amounts recognized for each major class of assets and liabilities transferred as at 30 June 20X2**

	CU
Financial assets	1,701
Inventory	5
Property, plant and equipment	74,656
Intangible assets	42
Financial liabilities	(2,001)
Total net assets	74,403

54(e) The following adjustments have been made to the carrying amounts of assets and liabilities recorded by COA and COB as at 30 June 20X2 prior to the amalgamation:

Paragraph reference		Original Amount (CU)	Adjustment (CU)	Revised Amount (CU)
54(e)(i)	Restatement of financial assets recorded by COA to eliminate transactions with COB	822	(25)	797
54(e)(i)	Restatement of financial liabilities recorded by COB to eliminate transactions with COA	(1,093)	25	(1,068)
54(e)(ii)	Restatement of property, plant, and equipment recorded by COA to measure the items using the current value model	12,116	17,954	30,070

54(f)

Amounts recognized in Net assets/equity as at 30 June 20X2

	COA (CU)	COB (CU)	Adjustment (CU)	RE (CU)
Revaluation surplus	0	18,332	17,954	36,286
Accumulated surpluses or deficits	12,047	26,070	0	38,117
Total net assets/equity	12,047	44,402	17,954	74,403

54(h)

At the time these financial statements were authorized for issue, the last reporting date for COA and COB was 31 December 20X1. The revenue and expense, and surplus or deficit for COA and COB from 1 January 20X2 to the amalgamation date (30 June 20X2), and the amounts reported by COA and COB for each major class of assets and liabilities, and for components of net assets/equity, is shown below:

		COA (CU)	COB (CU)
54(h)(i)	**Revenue**		
	Property taxes	45,213	70,369
	Revenue from compliance obligations in binding arrangements	2,681	25,377
	Transfers from other government entities	32,615	19,345
	Total revenue	80,509	115,091

54(h)(i)	**Expenses**		
	Wages, salaries and employee benefits	(51,263)	(68,549)
	Grants and other transfer payments	(18,611)	(26,445)
	Supplies and consumables used	(7,545)	(13,391)
	Depreciation expense	(677)	(2,598)
	Impairment of property, plant and equipment	(17)	(33)
	Finance costs	(2)	(3)
	Total expenses	(78,115)	(111,019)
54(h)(i)	**Surplus or (deficit) for the period 1 January 20X2 to 30 June 20X2**	2,394	4,072
54(h)(ii)	**Assets as at 30 June 20X2**		
	Financial assets	822	904
	Inventory	0	5
	Property, plant and equipment	12,116	44,586
	Intangible assets	42	0
	Total Assets	12,980	45,495
54(h)(ii)	**Liabilities as at 30 June 20X2**		
	Financial liabilities	(933)	(1,093)
	Total liabilities	(933)	(1,093)
54(h)(iii)	**Net assets as at 30 June 20X2**	12,047	44,402
	Net assets/equity as at 30 June 20X2		
	Revaluation surplus	0	18,332
	Accumulated surpluses or deficits	12,047	26,070
	Total net assets/equity as at 30 June 20X2	12,047	44,402

In considering the disclosures related to an amalgamation, an entity may find it helpful to refer to the discussion of materiality in IPSAS 1, *Presentation of Financial Statements*.

Accounting for Acquisitions

Reverse Acquisitions

Illustrating the Consequences of Recognizing a Reverse Acquisition by Applying Paragraphs AG66–AG71 of IPSAS 40

IE193. This example illustrates the accounting for a reverse acquisition in which Entity B, the legal controlled entity, acquires Entity A, the entity issuing equity instruments and therefore the legal controlling entity, in a reverse acquisition on 30 September 20X6. This example ignores the accounting for any income tax effects.

IE194. The statements of financial position of Entity A and Entity B immediately before the acquisition are:

	Entity A (legal controlling entity, accounting acquired operation) CU	Entity B (legal controlled entity, accounting acquirer) CU
Current assets	500	700
Non-current assets	1,300	3,000
Total assets	1,800	3,700
Current liabilities	300	600
Non-current liabilities	400	1,100
Total liabilities	700	1,700
Shareholders' equity		
Accumulated surplus or deficit	800	1,400
Issued equity		
100 ordinary shares	300	
60 ordinary shares		600
Total shareholders' equity	1,100	2,000
Total liabilities and shareholders' equity	1,800	3,700

IE195. This example also uses the following information:

(a) On 30 September 20X6 Entity A issues 2.5 shares in exchange for each ordinary share of Entity B. Entity B's sole shareholder, a government, exchanges its shares in Entity B. Therefore, Entity A issues 150 ordinary shares in exchange for all 60 ordinary shares of Entity B.

(b) The fair value of each ordinary share of Entity B at 30 September 20X6 is CU40. The quoted market price of Entity A's ordinary shares at that date is CU16.

(c) The fair values of Entity A's identifiable assets and liabilities at 30 September 20X6 are the same as their carrying amounts, except that the fair value of Entity A's non-current assets at 30 September 20X6 is CU1,500.

Calculating the Fair Value of the Consideration Transferred

IE196. As a result of Entity A (legal controlling entity, accounting acquired operation) issuing 150 ordinary shares, Entity B's shareholder (the government) owns 60 percent of the issued shares of the combined entity (i.e., 150 of 250 issued shares). The remaining 40 percent are owned by Entity A's shareholders. If the acquisition had taken the form of Entity B issuing additional ordinary shares to Entity A's shareholders in exchange for

their ordinary shares in Entity A, Entity B would have had to issue 40 shares for the ratio of ownership interest in the combined entity to be the same. Entity B's shareholder (the government) would then own 60 of the 100 issued shares of Entity B—60 percent of the combined entity. As a result, the fair value of the consideration effectively transferred by Entity B and the group's interest in Entity A is CU1,600 (40 shares with a fair value per share of CU40).

IE197. The fair value of the consideration effectively transferred should be based on the most reliable measure. In this example, the quoted price of Entity A's shares in the principal (or most advantageous) market for the shares provides a more reliable basis for measuring the consideration effectively transferred than the fair value of the shares in Entity B, and the consideration is measured using the market price of Entity A's shares—100 shares with a fair value per share of CU16.

Measuring Goodwill

IE198. Goodwill is measured as the excess of the fair value of the consideration effectively transferred (the group's interest in Entity A) over the net amount of Entity A's recognized identifiable assets and liabilities, as follows:

	CU	CU
Consideration effectively transferred		1,600
Net recognized values of Entity A's identifiable assets and liabilities		
Current assets	500	
Non-current assets	1,500	
Current liabilities	(300)	
Non-current liabilities	(400)	(1,300)
Goodwill		300

Consolidated Statement of Financial Position at 30 September 20X6

IE199. The consolidated statement of financial position immediately after the acquisition is:

	CU
Current assets [CU700 + CU500]	1,200
Non-current assets [CU3,000 + CU1,500]	4,500
Goodwill	300
Total assets	6,000
Current liabilities [CU600 + CU300]	900
Non-current liabilities [CU1,100 + CU400]	1,500
Total liabilities	2,400
Shareholders' equity	
Accumulated surplus or deficit	1,400
Issued equity	
250 ordinary shares [CU600 + CU1,600]	2,200
Total shareholders' equity	3,600
Total liabilities and shareholders' equity	6,000

IE200. The amount recognized as issued equity interests in the consolidated financial statements (CU2,200) is determined by adding the issued equity of the legal controlled entity immediately before the acquisition

(CU600) and the fair value of the consideration effectively transferred (CU1,600). However, the equity structure appearing in the consolidated financial statements (i.e., the number and type of equity interests issued) must reflect the equity structure of the legal controlling entity, including the equity interests issued by the legal controlling entity to effect the combination.

Non-Controlling Interest

IE201. Assume the same facts as above, except that Entity B has more than one shareholder, and that only 56 of Entity B's 60 ordinary shares are exchanged. Because Entity A issues 2.5 shares in exchange for each ordinary share of Entity B, Entity A issues only 140 (rather than 150) shares. As a result, Entity B's shareholders own 58.3 percent of the issued shares of the combined entity (140 of 240 issued shares). The fair value of the consideration transferred for Entity A, the accounting acquired operation, is calculated by assuming that the combination had been effected by Entity B issuing additional ordinary shares to the shareholders of Entity A in exchange for their ordinary shares in Entity A. That is because Entity B is the accounting acquirer, and paragraph AG67 of IPSAS 40 requires the acquirer to measure the consideration exchanged for the accounting acquired operation.

IE202. In calculating the number of shares that Entity B would have had to issue, the non-controlling interest is excluded from the calculation. The majority shareholder (the government) owns 56 shares of Entity B. For that to represent a 58.3 percent equity interest, Entity B would have had to issue an additional 40 shares. The majority shareholder (the government) would then own 56 of the 96 issued shares of Entity B and, therefore, 58.3 percent of the combined entity. As a result, the fair value of the consideration transferred for Entity A, the accounting acquired operation, is CU1,600 (i.e., 40 shares, each with a fair value of CU40). That is the same amount as when Entity B's sole shareholder tenders all 60 of its ordinary shares for exchange. The recognized amount of the group's interest in Entity A, the accounting acquired operation, does not change if some of Entity B's shareholders do not participate in the exchange.

IE203. The non-controlling interest is represented by the four shares of the total 60 shares of Entity B that are not exchanged for shares of Entity A. Therefore, the non-controlling interest is 6.7 percent. The non-controlling interest reflects the proportionate interest of the non-controlling shareholders in the pre-combination carrying amounts of the net assets of Entity B, the legal controlled entity. Therefore, the consolidated statement of financial position is adjusted to show a non-controlling interest of 6.7 percent of the pre-combination carrying amounts of Entity B's net assets (i.e., CU134 or 6.7 percent of CU2,000).

IE204. The consolidated statement of financial position at 30 September 20X6, reflecting the non-controlling interest, is as follows:

	CU
Current assets [CU700 + CU500]	1,200
Non-current assets [CU3,000 + CU1,500]	4,500
Goodwill	300
Total assets	6,000
Current liabilities [CU600 + CU300]	900
Non-current liabilities [CU1,100 + CU400]	1,500
Total liabilities	2,400
Shareholders' equity	
Accumulated surplus or deficit [CU1,400 × 93.3 percent]	1,306

	CU
Issued equity	
240 ordinary shares [CU560 + CU1,600]	2,160
Non-controlling interest	134
Total shareholders' equity	3,600
Total liabilities and shareholders' equity	6,000

IE205. The non-controlling interest of CU134 has two components. The first component is the reclassification of the non-controlling interest's share of the accounting acquirer's retained earnings immediately before the acquisition (CU1,400 × 6.7 percent or CU93.80). The second component represents the reclassification of the non-controlling interest's share of the accounting acquirer's issued equity (CU600 × 6.7 percent or CU40.20).

Identifiable Intangible Assets in an Acquisition

Illustrating the Consequences of Applying Paragraphs 64–68 and AG75–AG84 of IPSAS 40

IE206. The following are examples of identifiable intangible assets acquired in an acquisition. Some of the examples may have characteristics of assets other than intangible assets. The acquirer should account for those assets in accordance with their substance. The examples are not intended to be all-inclusive.

IE207. Intangible assets identified as having a 'binding arrangement' basis are those that arise from binding arrangements (including rights from contracts or other legal rights). Those designated as having a 'no binding arrangement' basis do not arise from binding arrangements but are separable. Intangible assets identified as having a binding arrangement basis might also be separable but separability is not a necessary condition for an asset to meet the binding arrangement criterion.

Marketing-Related Intangible Assets

IE208. Marketing-related intangible assets are used primarily in the marketing or promotion of products or services. Examples of marketing-related intangible assets are:

Class	Basis
Trademarks, trade names, service marks, collective marks and certification marks	Binding arrangement
Trade dress (unique color, shape or package design)	Binding arrangement
Newspaper mastheads	Binding arrangement
Internet domain names	Binding arrangement
Non-competition agreements	Binding arrangement

Trademarks, Trade Names, Service Marks, Collective Marks and Certification Marks

IE209. Trademarks are words, names, symbols or other devices used in trade to indicate the source of a product and to distinguish it from the products of others. A service mark identifies and distinguishes the source of a service rather than a product. Collective marks identify the goods or services of members of a group. Certification marks certify the geographical origin or other characteristics of a good or service.

IE210. Trademarks, trade names, service marks, collective marks and certification marks may be protected legally through registration with governmental agencies, continuous use in commerce or by other means. If it is protected legally through registration or other means, a trademark or other mark acquired in an acquisition is an intangible asset that meets the binding arrangement criterion. Otherwise, a trademark or other mark

acquired in an acquisition can be recognized separately from goodwill if the separability criterion is met, which normally it would be.

IE211. The terms *brand* and *brand name*, often used as synonyms for trademarks and other marks, are general marketing terms that typically refer to a group of complementary assets such as a trademark (or service mark) and its related trade name, formulas, recipes and technological expertise. IPSAS 40 does not preclude an entity from recognizing, as a single asset separately from goodwill, a group of complementary intangible assets commonly referred to as a brand if the assets that make up that group have similar useful lives.

Internet Domain Names

IE212. An Internet domain name is a unique alphanumeric name that is used to identify a particular numeric Internet address. Registration of a domain name creates an association between that name and a designated computer on the Internet for the period of the registration. Those registrations are renewable. A registered domain name acquired in an acquisition meets the binding arrangement criterion.

Service User or Customer-Related Intangible Assets

IE213. Examples of service user or customer-related intangible assets are:

Class	**Basis**
Lists of users of a service	No binding arrangement
Order or production backlog	Binding arrangement
Customer binding arrangements and the related customer relationships	Binding arrangement
Customer relationships arising through means other than binding arrangements	No binding arrangement

Lists of Users of a Service

IE214. A list of users of a service consists of information about service users, such as their names and contact information. A list of users of a service also may be in the form of a database that includes other information about the users, such as their service use histories and demographic information. A list of users of a service does not usually arise from a binding arrangement (including rights from contracts or other legal rights). However, lists of users of a service are often leased or exchanged. Therefore, a list of users of a service acquired in an acquisition normally meets the separability criterion.

Order or Production Backlog

IE215. An order or production backlog arises from binding arrangements such as purchase or sales orders. An order or production backlog acquired in an acquisition meets the binding arrangement criterion even if the purchase or sales orders can be cancelled.

Customer Binding Arrangements and the Related Customer Relationships

IE216. If an entity establishes relationships with its customers through binding arrangements, those customer relationships arise from binding arrangement rights. Therefore, customer binding arrangements and the related customer relationships acquired in an acquisition meet the binding arrangement criterion, even if confidentiality or other terms of the binding arrangement prohibit the sale or transfer of a binding arrangement separately from the acquired operation.

IE217. A customer binding arrangement and the related customer relationship may represent two distinct intangible assets. Both the useful lives and the pattern in which the economic benefits of the two assets are consumed may differ.

IE218. A customer relationship exists between an entity and its customer if (a) the -entity has information about the customer and has regular contact with the customer and (b) the customer has the ability to make direct contact with the entity. Customer relationships meet the binding arrangement criterion if an entity has a practice of establishing binding arrangements with its customers, regardless of whether a binding arrangement exists at the acquisition date. Customer relationships may also arise through means other than binding -arrangements, such as through regular contact by sales or service representatives.

IE219. As noted in paragraph IE215, an order or a production backlog arises from binding arrangements such as purchase or sales orders and is therefore considered a binding arrangement right. Consequently, if an entity has relationships with its customers through these types of binding arrangements, the customer relationships also arise from binding arrangement rights and therefore meet the binding arrangement criterion.

Examples

IE220. The following examples illustrate the recognition of customer binding arrangement and customer relationship intangible assets acquired in an acquisition.

(a) Acquirer Entity (AE) acquires Target Entity (TE) in an acquisition on 31 December 20X5. TE has a five-year agreement to supply goods to Customer. Both TE and AE believe that Customer will renew the agreement at the end of the current binding arrangement. The agreement is not separable.

The agreement, whether cancellable or not, meets the binding arrangement criterion. Additionally, because TE establishes its relationship with Customer through a binding arrangement, not only the agreement itself but also TE's customer relationship with Customer meet the binding arrangement criterion.

(b) AE acquires TE in an acquisition on 31 December 20X5. TE manufactures goods in two distinct lines of business: sporting goods and electronics. Customer purchases both sporting goods and electronics from TE. TE has a binding arrangement with Customer to be its exclusive provider of sporting goods but has no binding arrangement for the supply of electronics to Customer. Both TE and AE believe that only one overall customer relationship exists between TE and Customer.

The binding arrangement to be Customer's exclusive supplier of sporting goods, whether cancellable or not, meets the binding arrangement criterion. Additionally, because TE establishes its relationship with Customer through a binding arrangement, the customer relationship with Customer meets the binding arrangement criterion. Because TE has only one customer relationship with Customer, the fair value of that relationship incorporates assumptions about TE's relationship with Customer related to both sporting goods and electronics. However, if AE determines that the customer relationships with Customer for sporting goods and for electronics are separate from each other, AE would assess whether the customer relationship for electronics meets the separability criterion for identification as an intangible asset.

(c) AE acquires TE in an acquisition on 31 December 20X5. TE does business with its customers solely through purchase and sales orders. At 31 December 20X5, TE has a backlog of customer purchase orders from 60 percent of its customers, all of whom are recurring customers. The other 40 percent of TE's customers are also recurring customers. However, as of 31 December 20X5, TE has no open purchase orders or other binding arrangements with those customers.

Regardless of whether they are cancellable or not, the purchase orders from 60 percent of TE's customers meet the binding arrangement criterion. Additionally, because TE has established its relationship with 60 percent of its customers through binding arrangements, not only the purchase orders but also TE's customer relationships meet the binding arrangement criterion. Because TE has a practice of establishing binding arrangements with the remaining 40 percent of its customers, its

relationship with those customers also arises through binding arrangement rights and therefore meets the binding arrangement criterion even though TE does not have binding arrangements with those customers at 31 December 20X5.

(d) AE acquires TE, an insurer, in an acquisition on 31 December 20X5. TE has a portfolio of one-year motor insurance contracts that are cancellable by policyholders.

Because TE establishes its relationships with policyholders through insurance contracts, the customer relationship with policyholders meets the binding arrangement criterion. IPSAS 26, *Impairment of Cash-Generating Assets* and IPSAS 31, *Intangible Assets* apply to the customer relationship intangible asset.

Customer Relationships Arising through Means Other than Binding Arrangements

IE221. A customer relationship acquired in an acquisition that does not arise from a binding arrangement may nevertheless be identifiable because the relationship is separable. Exchange transactions for the same asset or a similar asset that indicate that other entities have sold or otherwise transferred a particular type of customer relationship arising through means other than binding arrangements would provide evidence that the relationship is separable.

Artistic-Related Intangible Assets

IE222. Examples of artistic-related intangible assets are:

Class	**Basis**
Plays, operas and ballets	Binding arrangement
Books, magazines, newspapers and other literary works	Binding arrangement
Musical works such as compositions, song lyrics and advertising jingles	Binding arrangement
Pictures and photographs	Binding arrangement
Video and audio-visual material, including motion pictures or films, music videos and television programs	Binding arrangement

IE223. Artistic-related assets acquired in an acquisition are identifiable if they arise from binding arrangements (including rights from contracts) or legal rights such as those provided by copyright. The holder can transfer a copyright, either in whole through an assignment or in part through a licensing agreement. An acquirer is not precluded from recognizing a copyright intangible asset and any related assignments or license agreements as a single asset, provided they have similar useful lives.

Binding Arrangement-Based Intangible Assets

IE224. Binding arrangement-based intangible assets represent the value of rights that arise from binding arrangements. Binding arrangements with customers are one type of binding arrangement-based intangible asset. If the terms of a binding arrangement give rise to a liability (for example, if the terms of a binding arrangement with a customer are unfavorable relative to market terms), the acquirer recognizes it as a liability assumed in the acquisition. Examples of binding arrangement-based intangible assets are:

Class	**Basis**
Licensing, royalty and standstill agreements	Binding arrangement
Advertising, construction, management, service or supply binding arrangements	Binding arrangement
Construction permits	Binding arrangement

Class	Basis
Franchise agreements	Binding arrangement
Operating and broadcast rights	Binding arrangement
Servicing binding arrangements, such as mortgage servicing binding arrangements	Binding arrangement
Binding arrangements for employment	Binding arrangement
Use rights, such as drilling, water, air, timber cutting and route authorities	Binding arrangement

Servicing Binding Arrangements, Such as Mortgage Servicing Binding Arrangements

IE225. Binding arrangements to service financial assets are one type of binding arrangement-based intangible asset. Although servicing is inherent in all financial assets, it becomes a distinct asset (or liability) by one of the following:

(a) When separated in the binding arrangement from the underlying financial asset by sale or securitization of the assets with servicing retained;

(b) Through the separate purchase and assumption of the servicing.

IE226. If mortgage loans, credit card receivables or other financial assets are -acquired in an acquisition with servicing retained, the inherent servicing rights are not a separate intangible asset because the fair value of those servicing rights is included in the measurement of the fair value of the acquired financial asset.

Binding Arrangements for Employment

IE227. Binding arrangements for employment that are beneficial binding arrangements from the perspective of the employer because the pricing of those binding arrangements is favorable relative to market terms are one type of binding arrangement-based intangible asset.

Use Rights

IE228. Use rights include rights for drilling, water, air, timber cutting and route authorities. Some use rights are binding arrangement-based intangible assets to be accounted for separately from goodwill. Other use rights may have characteristics of tangible assets rather than of intangible assets. An acquirer should account for use rights on the basis of their nature.

Technology-Based Intangible Assets

IE229. Examples of technology-based intangible assets are:

Class	Basis
Patented technology	Binding arrangement
Computer software and mask works	Binding arrangement
Unpatented technology	No binding arrangement
Databases, including title plants	No binding arrangement
Trade secrets, such as secret formulas, processes and recipes	Binding arrangement

Computer Software and Mask Works

IE230. Computer software and program formats acquired in an acquisition that are protected legally, such as by patent or copyright, meet the binding arrangement criterion for identification as intangible assets.

IE231. Mask works are software permanently stored on a read-only memory chip as a series of stencils or integrated circuitry. Mask works may have legal protection. Mask works with legal protection that are acquired in an acquisition meet the binding arrangement criterion for identification as intangible assets.

Databases, Including Title Plants

IE232. Databases are collections of information, often stored in electronic form (such as on computer disks or files). A database that includes original works of authorship may be entitled to copyright protection. A database acquired in an acquisition and protected by copyright meets the binding arrangement criterion. However, a database typically includes information created as a consequence of an entity's normal operations, such as lists of service users, or specialized information, such as scientific data or credit information. -Databases that are not protected by copyright can be, and often are, exchanged, licensed or leased to others in their entirety or in part. Therefore, even if the future economic benefits from a database do not arise from legal rights, a database acquired in an acquisition meets the separability criterion.

IE233. Title plants constitute a historical record of all matters affecting title to parcels of land in a particular geographical area. Title plant assets are bought and sold, either in whole or in part, in exchange transactions or are licensed. Therefore, title plant assets acquired in an acquisition meet the separability criterion.

Trade Secrets, Such as Secret Formulas, Processes and Recipes

IE234. A trade secret is 'information, including a formula, pattern, recipe, compilation, program, device, method, technique, or process that (a) derives independent economic value, actual or potential, from not being generally known and (b) is the subject of efforts that are reasonable under the circumstances to maintain its secrecy.'[3] If the future economic benefits from a trade secret acquired in an acquisition are legally protected, that asset meets the binding arrangement criterion. Otherwise, trade secrets acquired in an acquisition are identifiable only if the separability criterion is met, which is likely to be the case.

Measurement of Non-Controlling Interest (NCI) in an Acquisition

Illustrating the Consequences of Applying Paragraph 73 of IPSAS 40.

IE235. The following examples illustrate the measurement of components of NCI at the acquisition date in an acquisition.

Measurement of NCI Including Preference Shares

IE236. TE has issued 100 preference shares, which are classified as equity. The preference shares have a nominal value of CU1 each. The preference shares give their holders a right to a preferential dividend in priority to the payment of any dividend to the holders of ordinary shares. Upon liquidation of TE, the holders of the preference shares are entitled to receive out of the assets available for distribution the amount of CU1 per share in priority to the holders of ordinary shares. The holders of the preference shares do not have any further rights on liquidation.

IE237. AE acquires all ordinary shares of TE. The transaction gives AE control of TE, and an analysis of the economic substance of the combination using the guidance in paragraphs 9–14 and AG19–AG50 of IPSAS 40 confirms the transaction is an acquisition. The acquisition-date fair value of the preference shares is CU120.

IE238. Paragraph 73 of IPSAS 40 states that for each acquisition, the acquirer shall measure at the acquisition date components of non-controlling interest in the acquired operation that are present ownership interests and entitle their holders to a proportionate share of the entity's net assets in the event of liquidation at either fair

[3] Melvin Simensky and Lanning Bryer, The New Role of Intellectual Property in Commercial Transactions (New York: John Wiley & Sons, 1998), page 293.

value or the present ownership instruments' proportionate share in the acquired operation's recognized amounts of the identifiable net assets. All other components of non-controlling interest must be measured at their acquisition-date fair value, unless another measurement basis is required by IPSAS.

IE239. The non-controlling interests that relate to TE's preference shares do not qualify for the measurement choice in paragraph 73 of IPSAS 40 because they do not entitle their holders to a proportionate share of the entity's net assets in the event of liquidation. The acquirer measures the preference shares at their acquisition-date fair value of CU120.

First Variation

IE240. Suppose that upon liquidation of TE, the preference shares entitle their holders to receive a proportionate share of the assets available for distribution. The holders of the preference shares have equal right and ranking to the holders of ordinary shares in the event of liquidation. Assume that the acquisition-date fair value of the preference shares is now CU160 and that the proportionate share of TE's recognized amounts of the identifiable net assets that is attributable to the preference shares is CU140.

IE241. The preference shares qualify for the measurement choice in paragraph 73 of IPSAS 40. AE can choose to measure the preference shares either at their acquisition-date fair value of CU160 or at their proportionate share in the acquired operation's recognized amounts of the identifiable net assets of CU140.

Second Variation

IE242. Suppose also that TE has issued share options as remuneration to its employees. The share options are classified as equity and are vested at the acquisition date. They do not represent present ownership interest and do not entitle their holders to a proportionate share of TE's net assets in the event of liquidation. The fair value of the share options in accordance with the relevant international or national accounting standard dealing with share-based payments at the acquisition date is CU200. The share options do not expire on the acquisition date and AE does not replace them.

IE243. Paragraph 73 of IPSAS 40 requires such share options to be measured at their acquisition-date fair value, unless another measurement basis is required by IPSAS. Paragraph 84 of IPSAS 40 states that the acquirer shall measure an equity instrument related to share-based payment transactions of the acquired operation in accordance with the relevant international or national accounting standard dealing with share-based payments.

IE244. The acquirer measures the non-controlling interests that are related to the share options at their fair value of CU200.

Forgiveness of Amounts of Tax Due in an Acquisition

Illustrating the Consequences of Accounting for Tax Forgiveness in an Acquisition by Applying Paragraphs 78–79 and AG85–AG87 of IPSAS 40

IE245. The following example illustrates the accounting for an acquisition in which part of the acquired operation's tax liability is forgiven as part of the terms of the acquisition.

IE246. On 1 January 20X4 AE, a government ministry acting on behalf of the government, acquires TE, a private entity in exchange for cash of CU575. As a result of the acquisition, AE expects to reduce costs through economies of scale. The fair value of the assets acquired and liabilities assumed are as -follows:

Assets acquired and liabilities assumed:	**CU**
Financial assets	265
Inventory	5
Property, plant and equipment	640

Identifiable intangible assets	12
Financial liabilities	(320)
Tax liabilities	(40)
Total net assets	562

IE247. AE recognizes goodwill of CU13, the difference between the price paid to acquire TE (CU575) and the net assets of TE (CU562).

IE248. Suppose that as part of the terms of the acquisition, the government requires MF (the tax authority) to forgive 50 percent of TE's tax liability. The fair value of the assets acquired and liabilities assumed would now be as follows:

Assets acquired and liabilities assumed:	**CU**
Financial assets	265
Inventory	5
Property, plant and equipment	640
Identifiable intangible assets	12
Financial liabilities	(320)
Tax liabilities	(20)
Total net assets	582

IE249. AE recognizes a gain of CU7, the difference between the price paid to acquire TE (CU575) and the net assets of TE (CU582). AE would account for the remaining tax liability in accordance with the relevant international or national accounting standard dealing with income taxes.

IE250. MF accounts for tax receivable in accordance with IPSAS 47 and would recognize an adjustment for the tax forgiven.

Gain on a Bargain Purchase in an Acquisition

Illustrating the Consequences of Recognizing and Measuring a Gain from a Bargain Purchase in an Acquisition by Applying Paragraphs 85–90 of IPSAS 40

IE251. The following example illustrates the accounting for an acquisition in which a gain on a bargain purchase is recognized.

IE252. On 1 January 20X5 AE acquires 80 percent of the equity interests of TE, a private entity, in exchange for cash of CU150. Because the former owners of TE needed to dispose of their investments in TE by a specified date, they did not have sufficient time to market TE to multiple potential buyers. The management of AE initially measures the separately recognizable identifiable assets acquired and the liabilities assumed as of the acquisition date in accordance with the requirements of IPSAS 40. The identifiable assets are measured at CU250 and the liabilities assumed are measured at CU50. AE engages an independent consultant, who determines that the fair value of the 20 percent non-controlling interest in TE is CU42.

IE253. The amount of TE's identifiable net assets (CU200, calculated as CU250 – CU50) exceeds the fair value of the consideration transferred plus the fair value of the non-controlling interest in TE. Therefore, AE reviews the -procedures it used to identify and measure the assets acquired and liabilities assumed and to measure the fair value of both the non-controlling interest in TE and the consideration transferred. After that review, AE decides that the procedures and resulting measures were appropriate. AE measures the gain on its purchase of the 80 percent interest as follows:

			CU
Amount of the identifiable net assets acquired (CU250 – CU50)			200
Less:	Fair value of the consideration transferred for AE's 80 percent interest in TE; plus	150	
	Fair value of non-controlling interest in TE	42	
			192
Gain on bargain purchase of 80 percent interest			8

IE254. AE would record its acquisition of TE in its consolidated financial statements as follows:

	CU	CU
Dr Identifiable assets acquired	250	
Cr Cash		150
Cr Liabilities assumed		50
Cr Gain on the bargain purchase		8
Cr Equity—non-controlling interest in TE		42

IE255. If the acquirer chose to measure the non-controlling interest in TE on the basis of its proportionate interest in the identifiable net assets of the acquired operation, the recognized amount of the non-controlling interest would be CU40 (CU200 × 0.20). The gain on the bargain purchase then would be CU10 (CU200 – (CU150 + CU40)).

Measurement Period in an Acquisition

Illustrating the Consequences of Applying Paragraphs 103–108 of IPSAS 40.

IE256. If the initial accounting for an acquisition is not complete at the end of the financial reporting period in which the combination occurs, paragraph 103 of IPSAS 40 requires the acquirer to recognize in its financial statements provisional amounts for the items for which the accounting is incomplete. During the measurement period, the acquirer recognizes adjustments to the provisional amounts needed to reflect new information obtained about facts and circumstances that existed as of the acquisition date and, if known, would have affected the measurement of the amounts recognized as of that date. Paragraph 107 of IPSAS 40 requires the acquirer to recognize such adjustments as if the accounting for the acquisition had been completed at the acquisition date. Measurement period adjustments are not included in surplus or deficit.

IE257. Suppose that AE acquires TE on 30 September 20X7. AE seeks an independent valuation for an item of property, plant and equipment acquired in the combination, and the valuation was not complete by the time AE authorized for issue its financial statements for the year ended 31 December 20X7. In its 20X7 annual financial statements, AE recognized a provisional fair value for the asset of CU30,000. At the acquisition date, the item of property, plant and equipment had a remaining useful life of five years. Five months after the acquisition date, AE received the independent valuation, which estimated the asset's acquisition-date fair value as CU40,000.

IE258. In its financial statements for the year ended 31 December 20X8, AE retrospectively adjusts the 20X7 prior year information as follows:

(a) The carrying amount of property, plant and equipment as of 31 -December 20X7 is increased by CU9,500. That adjustment is measured as the fair value adjustment at the acquisition date of CU10,000

less the additional depreciation that would have been recognized if the asset's fair value at the acquisition date had been recognized from that date (CU500 for three months' depreciation).

(b) The carrying amount of goodwill as of 31 December 20X7 is -decreased by CU10,000.

(c) Depreciation expense for 20X7 is increased by CU500.

IE259. In accordance with paragraph 124 of IPSAS 40, AE discloses:

(a) In its 20X7 financial statements, that the initial accounting for the acquisition has not been completed because the valuation of property, plant and equipment has not yet been received.

(b) In its 20X8 financial statements, the amounts and explanations of the adjustments to the provisional values recognized during the current reporting period. Therefore, AE discloses that the 20X7 comparative information is adjusted retrospectively to increase the fair value of the item of property, plant and equipment at the acquisition date by CU9,500, offset by a decrease to goodwill of CU10,000 and an increase in depreciation expense of CU500.

Determining what is Part of the Acquisition Transaction

Settlement of a Pre-Existing Relationship – loan

Illustrating the Consequences of Applying Paragraphs 109–110 and AG98–AG101 of IPSAS 40.

IE260. AE provides TE with a five year, fixed rate loan of CU100. Interest is payable quarterly, with the principal repaid on maturity. With two years remaining under the loan agreement, AE acquires TE.

IE261. Included in the total fair value of TE is a CU90 financial liability for the fair value of the loan arrangement with AE. At the acquisition date, the carrying amount of the corresponding financial asset in AE's financial statements (the amortized cost of the loan) is CU100.

IE262. In this example, AE calculates a loss of CU10. The loss is calculated as the difference between the fair value of the financial liability assumed and carrying amount of the corresponding financial asset previously recognized by AE. In its consolidated financial statements, AE will eliminate its financial asset (CU100) against the fair value of TE's financial liability (CU90), the difference representing the loss to AE.

Settlement of a Pre-Existing Relationship – Transfers

Illustrating the Consequences of Applying Paragraphs 109–110 and AG98–AG101 of IPSAS 40.

IE263. On 1 January 20X7, AE acquires TE. Previously, on 1 October 20X6, AE entered into a binding arrangement with TE to provide TE with a transfer of CU800 to be used in the provision of an agreed number of training courses to the employees of TE (i.e., the compliance obligation).

IE264. The transfer was subject to a compliance obligation that the transfer would be returned proportionately to the number of training courses not delivered. Immediately prior to the acquisition, TE had delivered a quarter of the agreed number of courses, and recognized a liability of CU600 in respect of the unsatisfied portion of its compliance obligation, in accordance with IPSAS 47. Upon the transfer of funds, AE recognized a transfer right asset for its right to have TE deliver the training courses. Immediately prior to the acquisition, based on TE's performance to date, AE derecognizes CU200 of the transfer right asset and recognizes the amount as a transfer expense.

IE265. In this example, AE eliminates the liability of CU600 against the transfer right asset of CU600, as there is no longer an obligation owed to a third party or the enforceable right to have an external party deliver training course.

IE266. [Deleted]

Settlement of a Pre-Existing Relationship – Supply Contract

Illustrating the Consequences of Applying Paragraphs 109–110 and AG98–AG101 of IPSAS 40.

IE267. AE purchases electronic components from TE under a five-year supply contract at fixed rates. Currently, the fixed rates are higher than the rates at which AE could purchase similar electronic components from another supplier. The supply contract allows AE to terminate the contract before the end of the initial five-year term but only by paying a CU6 million penalty. With three years remaining under the supply contract, AE pays CU50 million to acquire TE, which is the fair value of TE based on what other market participants would be willing to pay.

IE268. Included in the total fair value of TE is CU8 million related to the fair value of the supply contract with AE. The CU8 million represents a CU3 million component that is 'at market' because the pricing is comparable to pricing for current market transactions for the same or similar items (selling effort, customer relationships and so on) and a CU5 million component for pricing that is unfavorable to AE because it exceeds the price of current market transactions for similar items. TE has no other identifiable assets or liabilities related to the supply contract, and AE has not recognized any assets or liabilities related to the supply contract before the acquisition.

IE269. In this example, AE calculates a loss of CU5 million (the lesser of the CU6 million stated settlement amount and the amount by which the contract is unfavorable to the acquirer) separately from the acquisition. The CU3 million 'at-market' component of the contract is part of goodwill.

IE270. Whether AE had recognized previously an amount in its financial statements related to a pre-existing relationship will affect the amount recognized as a gain or loss for the effective settlement of the relationship. Suppose that IPSAS had required AE to recognize a CU6 million liability for the supply contract before the acquisition. In that situation, AE recognizes a CU1 million settlement gain on the contract in surplus or deficit at the acquisition date (the CU5 million measured loss on the contract less the CU6 million loss previously recognized). In other words, AE has in effect settled a recognized liability of CU6 million for CU5 million, resulting in a gain of CU1 million.

Contingent Payments to Employees in an Acquisition

Illustrating the Consequences of Applying Paragraphs 109–110, AG98 and AG102– AG103 of IPSAS 40.

IE271. TE appointed a candidate as its new CEO under a ten-year contract. The contract required TE to pay the candidate CU5 million if TE is acquired before the contract expires. AE acquires TE eight years later. The CEO was still employed at the acquisition date and will receive the additional payment under the existing contract.

IE272. In this example, TE entered into the employment agreement before the negotiations of the combination began, and the purpose of the agreement was to obtain the services of CEO. Thus, there is no evidence that the agreement was arranged primarily to provide benefits to AE or the combined entity. Therefore, the liability to pay CU5 million is included in the application of the acquisition method.

IE273. In other circumstances, TE might enter into a similar agreement with CEO at the suggestion of AE during the negotiations for the acquisition. If so, the primary purpose of the agreement might be to provide severance pay to CEO, and the agreement may primarily benefit AE or the combined entity rather than TE or its former owners. In that situation, AE accounts for the liability to pay CEO in its post-combination financial statements separately from application of the acquisition method.

Subsequent Measurement of Transfers, Concessionary Loans and Similar Benefits Received by an Acquirer or an Acquired Operation on the Basis of Criteria that May Change as a Result of an Acquisition

Illustrating the Consequences of Applying Paragraphs 114 and AG109–AG111 of IPSAS 40.

IE274. The following example illustrates the subsequent accounting for a transfer received by an acquirer on the basis of criteria that may change as a result of an acquisition.

IE275. On 1 January 20X6, a national government provides an annual grant to those municipalities where their revenue per head of population is below a threshold. On 1 June 20X3 AE, a municipality, acquires TE, a shopping complex that will generate revenue for AE. AE had previously received a grant of CU500, based on its revenue per head of population.

IE276. As a result of its acquisition of TE on 1 June 20X3, the revenue per head of population of AE increases above the threshold that the government had set when allocating grants.

IE277. On 1 July 20X3, the national government requires AE to repay a portion (CU100) of the grant previously received by AE. AE recognizes a liability and an expense of CU100 on 1 July 20X3.

Disclosure Requirements Relating to Acquisitions

Illustrating the Consequences of Applying the Disclosure Requirements in Paragraphs 119–125 of IPSAS 40.

IE278. The following example illustrates some of the disclosure requirements relating to acquisitions; it is not based on an actual transaction. The example assumes that AE is a public sector entity with responsibility for healthcare in its region and that TE is a listed entity. The illustration presents the disclosures in a tabular format that refers to the specific disclosure requirements illustrated. An actual footnote might present many of the disclosures illustrated in a simple narrative format.

Paragraph reference	
120(a)–(d)	On 30 June 20X2 AE acquired 75 percent of the ordinary shares of TE and obtained control of TE. An analysis of the economic substance of the combination confirms the transaction is an acquisition. TE is a provider of medical supplies. As a result of the acquisition, AE is expected to deliver improved healthcare to its residents. It also expects to reduce costs through economies of scale.
120(e)	The goodwill of CU2,500 arising from the acquisition consists largely of the synergies and economies of scale expected from combining the operations of AE and TE.
120(k)	None of the goodwill recognized is expected to be deductible for income tax purposes. The following table summarizes the consideration paid for TE and the amounts of the assets acquired and liabilities assumed recognized at the acquisition date, as well as the fair value at the acquisition date of the non-controlling interest in TE.

At 30 June 20X2

	Consideration	**CU**
120(f)(i)	Cash	11,000
120(f)(iii); 120(g)(i)	Contingent consideration arrangement	1,000
120(f)	**Total consideration transferred**	12,000

Paragraph reference		
120(m)	**Acquisition-related costs** (included in selling, general and administrative expenses in AE's statement of comprehensive income for the year ended 31 December 20X2)	1,250
120(i)	**Recognized amounts of identifiable assets acquired and liabilities assumed**	
	Financial assets	3,500
	Inventory	1,000
	Property, plant and equipment	10,000
	Identifiable intangible assets	3,300
	Financial liabilities	(4,000)
	Contingent liability	(1,000)
	Total identifiable net assets	12,800
120(p)(i)	**Non-controlling interest in TE**	(3,300)
	Goodwill	2,500
		12,000

120(f)(iii)
120(g)
124(b)

The contingent consideration arrangement requires AE to pay the former owners of TE 5 percent of the revenues of XE, an unconsolidated equity investment owned by TE, in excess of CU7,500 for 20X3, up to a maximum amount of CU2,500 (undiscounted).

The potential undiscounted amount of all future payments that AE could be required to make under the contingent consideration arrangement is between CU0 and CU2,500.

The fair value of the contingent consideration arrangement of CU1,000 was estimated by applying an income approach. The fair value measurement is based on significant inputs that are not observable in the market, which IPSAS 46, *Measurement*, refers to as Level 3 inputs. Key assumptions include a discount rate range of 20–25 percent and assumed probability-adjusted revenues in XE of CU10,000–20,000.

As of 31 December 20X2, neither the amount recognized for the contingent consideration arrangement, nor the range of outcomes or the assumptions used to develop the estimates had changed.

120(h)

The fair value of the financial assets acquired includes receivables with a fair value of CU2,375. The gross amount due under the contracts is CU3,100, of which CU450 is expected to be uncollectible.

124(a)

The fair value of the acquired identifiable intangible -assets of CU3,300 is provisional pending receipt of the final valuations for those assets.

120(j)
124(c)
IPSAS 19.97, 98

A contingent liability of CU1,000 has been recognized for expected warranty claims on products sold by TE during the last three years. We expect that the majority of this expenditure will be incurred in 20X3 and that all will be incurred

Paragraph reference	
	by the end of 20X4. The potential undiscounted amount of all future payments that AE could be required to make under the warranty arrangements is estimated to be between CU500 and CU1,500. As of 31 December 20X2, there has been no change since 30 June 20X2 in the amount recognized for the liability or any change in the range of outcomes or assumptions used to develop the estimates.
120(p)	The fair value of the non-controlling interest in TE, a listed entity, was measured using the closing market price of TE's ordinary shares on the acquisition date.
120(r)(i)	The revenue included in the consolidated statement of comprehensive income since 30 June 20X2 contributed by TE was CU4,090. TE also contributed profit of CU1,710 over the same period.
120(r)(ii)	Had TE been consolidated from 1 January 20X2 the consolidated statement of comprehensive income would have included revenue of CU27,670 and profit of CU12,870.

In considering the disclosures related to an acquisition, an entity may find it helpful to refer to the discussion of materiality in IPSAS 1.

COMPARISON WITH IFRS 3

The acquisition accounting requirements in IPSAS 40 are drawn primarily from IFRS 3 (issued in 2004, including amendments up to December 31, 2015). The main differences between these requirements in IPSAS 40 and IFRS 3 are as follows:

- IFRS 3 includes guidance on determining the acquirer. In IPSAS 40, this is addressed when classifying a public sector combination as either an amalgamation or an acquisition.
- IPSAS 40 contains additional guidance on public sector specific transactions, for example tax forgiveness.
- IPSAS 40 uses different terminology, in certain instances, from IFRS 3. The most significant examples are the use of the terms “public sector combination”, “operation”, and “acquired operation”. The equivalent terms in IFRS 3 are “business combination”, “business” and “acquiree”.

IPSAS 41, *FINANCIAL INSTRUMENTS*

History of IPSAS Accounting Standard

This version includes amendments resulting from IPSAS Accounting Standards issued up to January 31, 2026.

IPSAS 41, *Financial Instruments* was issued in August 2018.

Since then, IPSAS 41 has been amended by the following IPSAS Accounting Standards:

- IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards* (issued November 2025)
- *Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* (issued August 2025)
- IPSAS 49, *Retirement Benefit Plans* (issued November 2023)
- IPSAS 47, *Revenue* (issued May 2023)
- IPSAS 46, *Measurement* (issued May 2023)
- IPSAS 43, *Leases* (issued January 2022)
- *Improvements to IPSAS 2021* (issued January 2022)
- Non-Authoritative Amendments to IPSAS 41, *Financial Instruments* (issued December 2020)
- *COVID-19: Deferral of Effective Dates* (issued November 2020)
- *Long-term Interests in Associates and Joint Ventures* (Amendments to IPSAS 36) and *Prepayment Features with Negative Compensation* (Amendments to IPSAS 41) (issued January 2019)

Comparison with IFRS 9

International Public Sector Accounting Standard 41, *Financial Instruments*, is set out in paragraphs 1–195. All the paragraphs have equal authority. IPSAS 41 should be read in the context of its objective, the Basis for Conclusions, the *Preface to IPSAS Accounting Standards and IPSASB SRS Standards*, and *The Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities*. IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*, provides a basis for selecting and applying accounting policies in the absence of explicit guidance.

Objective

1. The objective of this Standard is to establish principles for the financial reporting of financial assets and financial liabilities that will present relevant and useful information to users of financial statements for their assessment of the amounts, timing and uncertainty of an entity's future cash flows.

Scope

2. **This Standard shall be applied by all entities to all types of financial instruments except:**

   (a) **Those interests in controlled entities, associates and joint ventures that are accounted for in accordance with IPSAS 34, *Separate Financial Statements*, IPSAS 35, *Consolidated Financial Statements*, or IPSAS 36, *Investments in Associates and Joint Ventures*. However, in some cases, IPSAS 34, IPSAS 35 or IPSAS 36 require or permit an entity to account for an interest in a controlled entity, associate or joint venture in accordance with some or all of the requirements of this Standard. Entities shall also apply this Standard to derivatives on an interest in a controlled entity, associate or joint venture unless the derivative meets the definition of an equity instrument of the entity in IPSAS 28, *Financial Instruments: Presentation*.**

   (b) **Rights and obligations under leases to which IPSAS 43, *Leases* applies. However:**

      (i) **Finance lease receivables (i.e., net investments in finance leases) and operating lease receivables recognized by a lessor are subject to the derecognition and impairment requirements of this Standard;**

      (ii) **Lease liabilities recognized by a lessee are subject to the derecognition requirements in paragraph 35 of this Standard; and**

      (iii) **Derivatives that are embedded in leases are subject to the embedded derivatives requirements of this Standard.**

   (c) **Employers' rights and obligations under employee benefit plans, to which IPSAS 39, *Employee Benefits* applies.**

   (d) **Financial instruments issued by the entity that meet the definition of an equity instrument in IPSAS 28 (including options and warrants) or that are required to be classified as an equity instrument in accordance with paragraphs 15 and 16 or paragraphs 17 and 18 of IPSAS 28. However, the holder of such equity instruments shall apply this Standard to those instruments, unless they meet the exception in (a).**

   (e) **Rights and obligations arising under:**

      (i) **An insurance contract, other than an issuer's rights and obligations arising under an insurance contract that meets the definition of a financial guarantee contract in paragraph 9; or**

      (ii) **A contract that is within the scope of relevant international or national accounting standard dealing with insurance contracts because it contains a discretionary participation feature.**

   This Standard applies to a derivative that is embedded in a contract if the derivative is not itself an insurance contract (see paragraphs 47–53 and Appendix A paragraphs AG99–AG110 of this Standard). An entity applies this Standard to financial guarantee contracts, but shall apply the relevant international or national accounting standard dealing with insurance contracts if the issuer elects to apply that standard in recognizing and measuring them. Notwithstanding (i)

above, an entity may apply this Standard to other insurance contracts which involve the transfer of financial risk.

(f) **Any forward contract between an acquirer and a selling shareholder to buy or sell an acquired operation that will result in a public sector combination to which IPSAS 40 applies at a future acquisition date. The term of the forward contract should not exceed a reasonable period normally necessary to obtain any required approvals and to complete the transaction.**

(g) **Loan commitments other than those loan commitments described in paragraph 4. However, an issuer of loan commitments shall apply the impairment requirements of this Standard to loan commitments that are not otherwise within the scope of this Standard. Also, all loan commitments are subject to the derecognition requirements of this Standard.**

(h) **Financial instruments, contracts and obligations under share-based payment transactions to which the relevant international or national accounting standard dealing with share based payment applies, except for contracts within the scope of paragraphs 5–8 of this Standard to which this Standard applies.**

(i) **Rights to payments to reimburse the entity for expenditure that it is required to make to settle a liability that it recognizes as a provision in accordance with IPSAS 19 *Provisions, Contingent Liabilities and Contingent Assets*, or for which, in an earlier period, it recognized a provision in accordance with IPSAS 19.**

(j) **The initial recognition and initial measurement of rights and obligations arising from revenue transactions to which IPSAS 47, *Revenue* applies (see paragraph AG6);**

(k) **Rights and obligations under service concession arrangements to which IPSAS 32, *Service Concession Arrangements: Grantor* applies. However, financial liabilities recognized by a grantor under the financial liability model are subject to the derecognition provisions of this Standard (see paragraphs 35–38 and Appendix A paragraphs AG39–AG47).**

3. **The impairment requirements of this Standard shall be applied to those rights arising from IPSAS 47, and transactions for the purposes of recognizing impairment gains or losses.**

4. **The following loan commitments are within the scope of this Standard:**

(a) **Loan commitments that the entity designates as financial liabilities at fair value through surplus or deficit (see paragraph 46). An entity that has a past practice of selling the assets resulting from its loan commitments shortly after origination shall apply this Standard to all its loan commitments in the same class.**

(b) **Loan commitments that can be settled net in cash or by delivering or issuing another financial instrument. These loan commitments are derivatives. A loan commitment is not regarded as settled net merely because the loan is paid out in installments (for example, a mortgage construction loan that is paid out in installments in line with the progress of construction).**

(c) **Commitments to provide a loan at a below-market interest rate (see paragraph 45(d)).**

5. **This Standard shall be applied to those contracts to buy or sell a non-financial item that can be settled net in cash or another financial instrument, or by exchanging financial instruments, as if the contracts were financial instruments, with the exception of contracts that were entered into and continue to be held for the purpose of the receipt or delivery of a non-financial item in accordance with the entity's expected purchase, sale or usage requirements. However, this Standard shall be applied to those contracts that an entity designates as measured at fair value through surplus or deficit in accordance with paragraph 6.**

6. **A contract to buy or sell a non-financial item that can be settled net in cash or another financial instrument, or by exchanging financial instruments, as if the contract was a financial instrument, may be irrevocably designated as measured at fair value through surplus or deficit even if it was entered into for the purpose of the receipt or delivery of a non-financial item in accordance with the entity's expected purchase, sale or usage requirements. This designation is available only at inception of the contract and only if it eliminates or significantly reduces a recognition inconsistency (sometimes referred to as an 'accounting mismatch') that would otherwise arise from not recognizing that contract because it is excluded from the scope of this Standard (see paragraph 5).**

7. There are various ways in which a contract to buy or sell a non-financial item can be settled net in cash or another financial instrument or by exchanging financial instruments. These include:

   (a) When the terms of the contract permit either party to settle it net in cash or another financial instrument or by exchanging financial instruments;

   (b) When the ability to settle net in cash or another financial instrument, or by exchanging financial instruments, is not explicit in the terms of the contract, but the entity has a practice of settling similar contracts net in cash or another financial instrument or by exchanging financial instruments (whether with the counterparty, by entering into offsetting contracts or by selling the contract before its exercise or lapse);

   (c) When, for similar contracts, the entity has a practice of taking delivery of the underlying and selling it within a short period after delivery for the purpose of generating a profit from short-term fluctuations in price or dealer's margin; and

   (d) When the non-financial item that is the subject of the contract is readily convertible to cash.

   A contract to which (b) or (c) applies is not entered into for the purpose of the receipt or delivery of the non-financial item in accordance with the entity's expected purchase, sale or usage requirements and, accordingly, is within the scope of this Standard. Other contracts to which paragraph 5 applies are evaluated to determine whether they were entered into and continue to be held for the purpose of the receipt or delivery of the non-financial item in accordance with the entity's expected purchase, sale or usage requirements and, accordingly, whether they are within the scope of this Standard.

8. A written option to buy or sell a non-financial item that can be settled net in cash or another financial instrument, or by exchanging financial instruments, in accordance with paragraph 7(a) or 7(d) is within the scope of this Standard. Such a contract cannot be entered into for the purpose of the receipt or delivery of the non-financial item in accordance with the entity's expected purchase, sale or usage requirements.

Definitions

9. **The following terms are used in this Standard with the meanings specified:**

   12-month expected credit losses are the portion of lifetime expected credit losses that represent the expected credit losses that result from default events on a financial instrument that are possible within the 12 months after the reporting date.

   The amortized cost of a financial asset or financial liability is the amount at which the financial asset or financial liability is measured at initial recognition minus the principal repayments, plus or minus the cumulative amortization using the effective interest method of any difference between that initial amount and the maturity amount and, for financial assets, adjusted for any loss allowance.

   A credit-impaired financial asset is a financial asset that is credit-impaired when one or more events that have a detrimental impact on the estimated future cash flows of that financial asset have

occurred. Evidence that a financial asset is credit-impaired include observable data about the following events:

(a) **Significant financial difficulty of the issuer or the borrower;**

(b) **A breach of contract, such as a default or past due event;**

(c) **The lender(s) of the borrower, for economic or contractual reasons relating to the borrower's financial difficulty, having granted to the borrower a concession(s) that the lender(s) would not otherwise consider;**

(d) **It is becoming probable that the borrower will enter bankruptcy or other financial reorganization;**

(e) **The disappearance of an active market for that financial asset because of financial difficulties; or**

(f) **The purchase or origination of a financial asset at a deep discount that reflects the incurred credit losses.**

It may not be possible to identify a single discrete event—instead, the combined effect of several events may have caused financial assets to become credit-impaired.

Credit loss is the difference between all contractual cash flows that are due to an entity in accordance with the contract and all the cash flows that the entity expects to receive (i.e., all cash shortfalls), discounted at the original effective interest rate (or credit-adjusted effective interest rate for purchased or originated credit-impaired financial assets). An entity shall estimate cash flows by considering all contractual terms of the financial instrument (for example, prepayment, extension, call and similar options) through the expected life of that financial instrument. The cash flows that are considered shall include cash flows from the sale of collateral held or other credit enhancements that are integral to the contractual terms. There is a presumption that the expected life of a financial instrument can be estimated reliably. However, in those rare cases when it is not possible to reliably estimate the expected life of a financial instrument, the entity shall use the remaining contractual term of the financial instrument.

Credit-adjusted effective interest rate is the rate that exactly discounts the estimated future cash payments or receipts through the expected life of the financial asset to the amortized cost of a financial asset that is a purchased or originated credit-impaired financial asset. When calculating the credit-adjusted effective interest rate, an entity shall estimate the expected cash flows by considering all contractual terms of the financial asset (for example, prepayment, extension, call and similar options) and expected credit losses. The calculation includes all fees and points paid or received between parties to the contract that are an integral part of the effective interest rate (see paragraphs AG156–AG158), transaction costs, and all other premiums or discounts. There is a presumption that the cash flows and the expected life of a group of similar financial instruments can be estimated reliably. However, in those rare cases when it is not possible to reliably estimate the cash flows or the remaining life of a financial instrument (or group of financial instruments), the entity shall use the contractual cash flows over the full contractual term of the financial instrument (or group of financial instruments).

Derecognition is the removal of a previously recognized financial asset or financial liability from an entity's statement of financial position.

A derivative is a financial instrument or other contract within the scope of this Standard with all three of the following characteristics.

(a) **Its value changes in response to the change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract (sometimes called the 'underlying').**

(b) **It requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors.**

(c) **It is settled at a future date.**

Dividends or similar distributions are distributions to holders of equity instruments in proportion to their holdings of a particular class of capital.

The effective interest method is the method that is used in the calculation of the amortized cost of a financial asset or a financial liability and in the allocation and recognition of the interest revenue or interest expense in surplus or deficit over the relevant period.

The effective interest rate is the rate that exactly discounts estimated future cash payments or receipts through the expected life of the financial asset or financial liability to the gross carrying amount of a financial asset or to the amortized cost of a financial liability. When calculating the effective interest rate, an entity shall estimate the expected cash flows by considering all the contractual terms of the financial instrument (for example, prepayment, extension, call and similar options) but shall not consider the expected credit losses. The calculation includes all fees and points paid or received between parties to the contract that are an integral part of the effective interest rate (see paragraphs AG156–AG158), transaction costs, and all other premiums or discounts. There is a presumption that the cash flows and the expected life of a group of similar financial instruments can be estimated reliably. However, in those rare cases when it is not possible to reliably estimate the cash flows or the expected life of a financial instrument (or group of financial instruments), the entity shall use the contractual cash flows over the full contractual term of the financial instrument (or group of financial instruments).

An expected credit loss is the weighted average of credit losses with the respective risks of a default occurring as the weights.

A financial guarantee contract is a contract that requires the issuer to make specified payments to reimburse the holder for a loss it incurs because a specified debtor fails to make payment when due in accordance with the original or modified terms of a debt instrument.

A financial liability at fair value through surplus or deficit is a financial liability that meets one of the following conditions:

(a) **It meets the definition of held for trading.**

(b) **Upon initial recognition it is designated by the entity as at fair value through surplus or deficit in accordance with paragraph 46 or 51.**

(c) **It is designated either upon initial recognition or subsequently as at fair value through surplus or deficit in accordance with paragraph 152.**

A firm commitment is a binding agreement for the exchange of a specified quantity of resources at a specified price on a specified future date or dates.

A forecast transaction is an uncommitted but anticipated future transaction.

The gross carrying amount of a financial asset is the amortized cost of a financial asset, before adjusting for any loss allowance.

The hedge ratio is the relationship between the quantity of the hedging instrument and the quantity of the hedged item in terms of their relative weighting.

A held for trading financial instrument is a financial asset or financial liability that:

(a) **Is acquired or incurred principally for the purpose of selling or repurchasing it in the near term;**

(b) **On initial recognition is part of a portfolio of identified financial instruments that are managed together and for which there is evidence of a recent actual pattern of short-term profit-taking; or**

(c) **Is a derivative (except for a derivative that is a financial guarantee contract or a designated and effective hedging instrument).**

An impairment gain or loss is recognized in surplus or deficit in accordance with paragraph 80 and arises from applying the impairment requirements in paragraphs 73–93.

Lifetime expected credit losses are the expected credit losses that result from all possible default events over the expected life of a financial instrument.

A loss allowance is the allowance for expected credit losses on financial assets measured in accordance with paragraph 40, lease receivables, the accumulated impairment amount for financial assets measured in accordance with paragraph 41 and the provision for expected credit losses on loan commitments and financial guarantee contracts.

A modification gain or loss is the amount arising from adjusting the gross carrying amount of a financial asset to reflect the renegotiated or modified contractual cash flows. The entity recalculates the gross carrying amount of a financial asset as the present value of the estimated future cash payments or receipts through the expected life of the renegotiated or modified financial asset that are discounted at the financial asset's original effective interest rate (or the original credit-adjusted effective interest rate for purchased or originated credit-impaired financial assets) or, when applicable, the revised effective interest rate calculated in accordance with paragraph 139. When estimating the expected cash flows of a financial asset, an entity shall consider all contractual terms of the financial asset (for example, prepayment, call and similar options) but shall not consider the expected credit losses, unless the financial asset is a purchased or originated credit-impaired financial asset, in which case an entity shall also consider the initial expected credit losses that were considered when calculating the original credit-adjusted effective interest rate.

A financial asset is past due when a counterparty has failed to make a payment when that payment was contractually due.

A purchased or originated credit-impaired financial asset is credit-impaired on initial recognition.

The reclassification date is the first day of the first reporting period following the change in management model that results in an entity reclassifying financial assets.

A regular way purchase or sale is a purchase or sale of a financial asset under a contract whose terms require delivery of the asset within the time frame established generally by regulation or convention in the marketplace concerned.

Transaction costs are incremental costs that are directly attributable to the acquisition, issue or disposal of a financial asset or financial liability (see paragraph AG163). An incremental cost is one

that would not have been incurred if the entity had not acquired, issued or disposed of the financial instrument.

Terms defined in other IPSAS are used in this Standard with the same meaning as in those Standards, and are reproduced in the Glossary of Defined Terms published separately. The following terms are defined in either IPSAS 28, IPSAS 30, *Financial Instruments: Disclosures*, or IPSAS 46, *Measurement*: credit risk[1], currency risk, fair value, liquidity risk, market risk, equity instrument, financial asset, financial instrument, financial liability and puttable instrument.

Recognition and Derecognition

Initial Recognition

10. **An entity shall recognize a financial asset or a financial liability in its statement of financial position when, and only when, the entity becomes party to the contractual provisions of the instrument (see paragraphs AG15 and AG16). When an entity first recognizes a financial asset, it shall classify it in accordance with paragraphs 39–44 and measure it in accordance with paragraphs 57 and 59. When an entity first recognizes a financial liability, it shall classify it in accordance with paragraphs 45 and 46 and measure it in accordance with paragraph 57.**

Regular Way Purchase or Sale of Financial Assets

11. **A regular way purchase or sale of financial assets shall be recognized and derecognized, as applicable, using trade date accounting or settlement date accounting (see paragraphs AG17–AG20).**

Derecognition of Financial Assets

12. In consolidated financial statements, paragraphs 13–20, AG15, AG16 and AG21–AG38 are applied at a consolidated level. Hence, an entity first consolidates all controlled entities in accordance with IPSAS 35 and then applies those paragraphs to the resulting economic entity.

13. **Before evaluating whether, and to what extent, derecognition is appropriate under paragraphs 14–20, an entity determines whether those paragraphs should be applied to a part of a financial asset (or a part of a group of similar financial assets) or a financial asset (or a group of similar financial assets) in its entirety, as follows.**

    (a) **Paragraphs 14–20 are applied to a part of a financial asset (or a part of a group of similar financial assets) if, and only if, the part being considered for derecognition meets one of the following three conditions.**

        (i) **The part comprises only specifically identified cash flows from a financial asset (or a group of similar financial assets). For example, when an entity enters into an interest rate strip whereby the counterparty obtains the right to the interest cash flows, but not the principal cash flows from a debt instrument, paragraphs 14–20 are applied to the interest cash flows.**

        (ii) **The part comprises only a fully proportionate (pro rata) share of the cash flows from a financial asset (or a group of similar financial assets). For example, when an entity enters into an arrangement whereby the counterparty obtains the rights to a 90 percent share of all cash flows of a debt instrument, paragraphs 14–20 are applied to 90 percent of those cash flows. If there is more than one counterparty, each counterparty is not required to**

[1] This term (as defined in IPSAS 30) is used in the requirements for presenting the effects of changes in credit risk on liabilities designated as at fair value through surplus or deficit (see paragraph 108).

have a proportionate share of the cash flows provided that the transferring entity has a fully proportionate share.

(iii) **The part comprises only a fully proportionate (pro rata) share of specifically identified cash flows from a financial asset (or a group of similar financial assets). For example, when an entity enters into an arrangement whereby the counterparty obtains the rights to a 90 percent share of interest cash flows from a financial asset, paragraphs 14–20 are applied to 90 percent of those interest cash flows. If there is more than one counterparty, each counterparty is not required to have a proportionate share of the specifically identified cash flows provided that the transferring entity has a fully proportionate share.**

(b) **In all other cases, paragraphs 14–20 are applied to the financial asset in its entirety (or to the group of similar financial assets in their entirety). For example, when an entity transfers (i) the rights to the first or the last 90 percent of cash collections from a financial asset (or a group of financial assets), or (ii) the rights to 90 percent of the cash flows from a group of receivables, but provides a guarantee to compensate the buyer for any credit losses up to 8 percent of the principal amount of the receivables, paragraphs 14–20 are applied to the financial asset (or a group of similar financial assets) in its entirety.**

In paragraphs 14–23, the term 'financial asset' refers to either a part of a financial asset (or a part of a group of similar financial assets) as identified in (a) above or, otherwise, a financial asset (or a group of similar financial assets) in its entirety.

14. **An entity shall derecognize a financial asset when, and only when:**

(a) **The contractual rights to the cash flows from the financial asset expire or are waived, or**

(b) **It transfers the financial asset as set out in paragraphs 15 and 16 and the transfer qualifies for derecognition in accordance with paragraph 17.**

(See paragraph 11 for regular way sales of financial assets.)

15. **An entity transfers a financial asset if, and only if, it either:**

(a) **Transfers the contractual rights to receive the cash flows of the financial asset, or**

(b) **Retains the contractual rights to receive the cash flows of the financial asset, but assumes a contractual obligation to pay the cash flows to one or more recipients in an arrangement that meets the conditions in paragraph 16.**

16. **When an entity retains the contractual rights to receive the cash flows of a financial asset (the 'original asset'), but assumes a contractual obligation to pay those cash flows to one or more entities (the 'eventual recipients'), the entity treats the transaction as a transfer of a financial asset if, and only if, all of the following three conditions are met.**

(a) **The entity has no obligation to pay amounts to the eventual recipients unless it collects equivalent amounts from the original asset. Short-term advances by the entity with the right of full recovery of the amount lent plus accrued interest at market rates do not violate this condition.**

(b) **The entity is prohibited by the terms of the transfer contract from selling or pledging the original asset other than as security to the eventual recipients for the obligation to pay them cash flows.**

(c) **The entity has an obligation to remit any cash flows it collects on behalf of the eventual recipients without material delay. In addition, the entity is not entitled to reinvest such cash flows, except for investments in cash or cash equivalents (as defined in IPSAS 2, *Cash Flow***

***Statements*) during the short settlement period from the collection date to the date of required remittance to the eventual recipients, and interest earned on such investments is passed to the eventual recipients.**

17. **When an entity transfers a financial asset (see paragraph 15), it shall evaluate the extent to which it retains the risks and rewards of ownership of the financial asset. In this case:**

    (a) **If the entity transfers substantially all the risks and rewards of ownership of the financial asset, the entity shall derecognize the financial asset and recognize separately as assets or liabilities any rights and obligations created or retained in the transfer.**

    (b) **If the entity retains substantially all the risks and rewards of ownership of the financial asset, the entity shall continue to recognize the financial asset.**

    (c) **If the entity neither transfers nor retains substantially all the risks and rewards of ownership of the financial asset, the entity shall determine whether it has retained control of the financial asset. In this case:**

        (i) **If the entity has not retained control, it shall derecognize the financial asset and recognize separately as assets or liabilities any rights and obligations created or retained in the transfer.**

        (ii) **If the entity has retained control, it shall continue to recognize the financial asset to the extent of its continuing involvement in the financial asset (see paragraph 27).**

18. The transfer of risks and rewards (see paragraph 17) is evaluated by comparing the entity's exposure, before and after the transfer, with the variability in the amounts and timing of the net cash flows of the transferred asset. An entity has retained substantially all the risks and rewards of ownership of a financial asset if its exposure to the variability in the present value of the future net cash flows from the financial asset does not change significantly as a result of the transfer (e.g., because the entity has sold a financial asset subject to an agreement to buy it back at a fixed price or the sale price plus a lender's return). An entity has transferred substantially all the risks and rewards of ownership of a financial asset if its exposure to such variability is no longer significant in relation to the total variability in the present value of the future net cash flows associated with the financial asset (e.g., because the entity has sold a financial asset subject only to an option to buy it back at its fair value at the time of repurchase or has transferred a fully proportionate share of the cash flows from a larger financial asset in an arrangement, such as a loan sub-participation, that meets the conditions in paragraph 16).

19. Often it will be obvious whether the entity has transferred or retained substantially all risks and rewards of ownership and there will be no need to perform any computations. In other cases, it will be necessary to compute and compare the entity's exposure to the variability in the present value of the future net cash flows before and after the transfer. The computation and comparison are made using as the discount rate an appropriate current market interest rate. All reasonably possible variability in net cash flows is considered, with greater weight being given to those outcomes that are more likely to occur.

20. Whether the entity has retained control (see paragraph 17(c)) of the transferred asset depends on the transferee's ability to sell the asset. If the transferee has the practical ability to sell the asset in its entirety to an unrelated third party and is able to exercise that ability unilaterally and without needing to impose additional restrictions on the transfer, the entity has not retained control. In all other cases, the entity has retained control.

Transfers that Qualify for Derecognition

21. **If an entity transfers a financial asset in a transfer that qualifies for derecognition in its entirety and retains the right to service the financial asset for a fee, it shall recognize either a servicing asset or a servicing liability for that servicing contract. If the fee to be received is not expected to compensate the entity adequately for performing the servicing, a servicing liability for the servicing obligation shall be recognized at its fair value. If the fee to be received is expected to be more than adequate compensation for the servicing, a servicing asset shall be recognized for the servicing right at an amount determined on the basis of an allocation of the carrying amount of the larger financial asset in accordance with paragraph 24.**

22. **If, as a result of a transfer, a financial asset is derecognized in its entirety but the transfer results in the entity obtaining a new financial asset or assuming a new financial liability, or a servicing liability, the entity shall recognize the new financial asset, financial liability or servicing liability at fair value.**

23. **On derecognition of a financial asset in its entirety, the difference between:**

    (a) **The carrying amount (measured at the date of derecognition); and**

    (b) **The consideration received (including any new asset obtained less any new liability assumed)**

    shall be recognized in surplus or deficit.

24. **If the transferred asset is part of a larger financial asset (e.g., when an entity transfers interest cash flows that are part of a debt instrument, see paragraph 13(a)) and the part transferred qualifies for derecognition in its entirety, the previous carrying amount of the larger financial asset shall be allocated between the part that continues to be recognized and the part that is derecognized, on the basis of the relative fair values of those parts on the date of the transfer. For this purpose, a retained servicing asset shall be treated as a part that continues to be recognized. The difference between:**

    (a) **The carrying amount (measured at the date of derecognition) allocated to the part derecognized; and**

    (b) **The consideration received for the part derecognized (including any new asset obtained less any new liability assumed)**

    shall be recognized in surplus or deficit.

25. When an entity allocates the previous carrying amount of a larger financial asset between the part that continues to be recognized and the part that is derecognized, the fair value of the part that continues to be recognized needs to be measured. When the entity has a history of selling parts similar to the part that continues to be recognized or other market transactions exist for such parts, recent prices of actual transactions provide the best estimate of its fair value. When there are no price quotes or recent market transactions to support the fair value of the part that continues to be recognized, the best estimate of the fair value is the difference between the fair value of the larger financial asset as a whole and the consideration received from the transferee for the part that is derecognized.

Transfers that do not Qualify for Derecognition

26. **If a transfer does not result in derecognition because the entity has retained substantially all the risks and rewards of ownership of the transferred asset, the entity shall continue to recognize the transferred asset in its entirety and shall recognize a financial liability for the consideration received. In subsequent periods, the entity shall recognize any revenue on the transferred asset and any expense incurred on the financial liability.**

Continuing Involvement in Transferred Assets

27. **If an entity neither transfers nor retains substantially all the risks and rewards of ownership of a transferred asset, and retains control of the transferred asset, the entity continues to recognize the transferred asset to the extent of its continuing involvement. The extent of the entity's continuing involvement in the transferred asset is the extent to which it is exposed to changes in the value of the transferred asset. For example:**

    (a) **When the entity's continuing involvement takes the form of guaranteeing the transferred asset, the extent of the entity's continuing involvement is the lower of (i) the amount of the asset and (ii) the maximum amount of the consideration received that the entity could be required to repay ('the guarantee amount').**

    (b) **When the entity's continuing involvement takes the form of a written or purchased option (or both) on the transferred asset, the extent of the entity's continuing involvement is the amount of the transferred asset that the entity may repurchase. However, in the case of a written put option on an asset that is measured at fair value, the extent of the entity's continuing involvement is limited to the lower of the fair value of the transferred asset and the option exercise price (see paragraph AG34).**

    (c) **When the entity's continuing involvement takes the form of a cash-settled option or similar provision on the transferred asset, the extent of the entity's continuing involvement is measured in the same way as that which results from non-cash settled options as set out in (b) above.**

28. **When an entity continues to recognize an asset to the extent of its continuing involvement, the entity also recognizes an associated liability. Despite the other measurement requirements in this Standard, the transferred asset and the associated liability are measured on a basis that reflects the rights and obligations that the entity has retained. The associated liability is measured in such a way that the net carrying amount of the transferred asset and the associated liability is:**

    (a) **The amortized cost of the rights and obligations retained by the entity, if the transferred asset is measured at amortized cost; or**

    (b) **Equal to the fair value of the rights and obligations retained by the entity when measured on a stand-alone basis, if the transferred asset is measured at fair value.**

29. **The entity shall continue to recognize any revenue arising on the transferred asset to the extent of its continuing involvement and shall recognize any expense incurred on the associated liability.**

30. **For the purpose of subsequent measurement, recognized changes in the fair value of the transferred asset and the associated liability are accounted for consistently with each other in accordance with paragraph 101, and shall not be offset.**

31. **If an entity's continuing involvement is in only a part of a financial asset (e.g., when an entity retains an option to repurchase part of a transferred asset, or retains a residual interest that does not result in the retention of substantially all the risks and rewards of ownership and the entity retains control), the entity allocates the previous carrying amount of the financial asset between the part it continues to recognize under continuing involvement, and the part it no longer recognizes on the basis of the relative fair values of those parts on the date of the transfer. For this purpose, the requirements of paragraph 25 apply. The difference between:**

    (a) **The carrying amount (measured at the date of derecognition) allocated to the part that is no longer recognized; and**

(b) **The consideration received for the part no longer recognized**

shall be recognized in surplus or deficit.

32. If the transferred asset is measured at amortized cost, the option in this Standard to designate a financial liability as at fair value through surplus or deficit is not applicable to the associated liability.

All Transfers

33. **If a transferred asset continues to be recognized, the asset and the associated liability shall not be offset. Similarly, the entity shall not offset any revenue arising from the transferred asset with any expense incurred on the associated liability (see paragraph 47 of IPSAS 28).**

34. **If a transferor provides non-cash collateral (such as debt or equity instruments) to the transferee, the accounting for the collateral by the transferor and the transferee depends on whether the transferee has the right to sell or repledge the collateral and on whether the transferor has defaulted. The transferor and transferee shall account for the collateral as follows:**

(a) **If the transferee has the right by contract or custom to sell or repledge the collateral, then the transferor shall reclassify that asset in its statement of financial position (e.g., as a loaned asset, pledged equity instruments or repurchase receivable) separately from other assets.**

(b) **If the transferee sells collateral pledged to it, it shall recognize the proceeds from the sale and a liability measured at fair value for its obligation to return the collateral.**

(c) **If the transferor defaults under the terms of the contract and is no longer entitled to redeem the collateral, it shall derecognize the collateral, and the transferee shall recognize the collateral as its asset initially measured at fair value or, if it has already sold the collateral, derecognize its obligation to return the collateral.**

(d) **Except as provided in (c), the transferor shall continue to carry the collateral as its asset, and the transferee shall not recognize the collateral as an asset.**

Derecognition of Financial Liabilities

35. **An entity shall remove a financial liability (or a part of a financial liability) from its statement of financial position when, and only when, it is extinguished—i.e., when the obligation specified in the contract is discharged, waived, canceled or expires.**

36. **An exchange between an existing borrower and lender of debt instruments with substantially different terms shall be accounted for as an extinguishment of the original financial liability and the recognition of a new financial liability. Similarly, a substantial modification of the terms of an existing financial liability or a part of it (whether or not attributable to the financial difficulty of the debtor) shall be accounted for as an extinguishment of the original financial liability and the recognition of a new financial liability.**

37. **The difference between the carrying amount of a financial liability (or part of a financial liability) extinguished or transferred to another party and the consideration paid, including any non-cash assets transferred or liabilities assumed, shall be recognized in surplus or deficit. Where an obligation is waived by the lender or assumed by a third party as part of a non-exchange transaction, an entity applies IPSAS 47.**

38. If an entity repurchases a part of a financial liability, the entity shall allocate the previous carrying amount of the financial liability between the part that continues to be recognized and the part that is derecognized based on the relative fair values of those parts on the date of the repurchase. The difference between (a) the carrying

amount allocated to the part derecognized and (b) the consideration paid, including any non-cash assets transferred or liabilities assumed, for the part derecognized shall be recognized in surplus or deficit.

Classification

Classification of Financial Assets

39. **Unless paragraph 44 applies, an entity shall classify financial assets as subsequently measured at amortized cost, fair value through net assets/equity or fair value through surplus or deficit on the basis of both:**

    (a) **The entity's management model for financial assets and**

    (b) **The contractual cash flow characteristics of the financial asset.**

40. **A financial asset shall be measured at amortized cost if both of the following conditions are met:**

    (a) **The financial asset is held within a management model whose objective is to hold financial assets in order to collect contractual cash flows; and**

    (b) **The contractual terms of the financial asset give rise on specified dates to cash flows that are solely payments of principal and interest on the principal amount outstanding.**

    Paragraphs AG48–AG88 provide guidance on how to apply these conditions.

41. **A financial asset shall be measured at fair value through net assets/equity if both of the following conditions are met:**

    (a) **The financial asset is held within a management model whose objective is achieved by both collecting contractual cash flows and selling financial assets; and**

    (b) **The contractual terms of the financial asset give rise on specified dates to cash flows that are solely payments of principal and interest on the principal amount outstanding.**

    Paragraphs AG48–AG88 provide guidance on how to apply these conditions.

42. **For the purpose of applying paragraphs 40(b)and 41(b):**

    (a) **Principal is the fair value of the financial asset at initial recognition. Paragraph AG64 provides additional guidance on the meaning of principal.**

    (b) **Interest consists of consideration for the time value of money, for the credit risk associated with the principal amount outstanding during a particular period of time and for other basic lending risks and costs, as well as a profit margin. Paragraphs AG63 and AG67–AG71 provide additional guidance on the meaning of interest, including the meaning of the time value of money.**

43. **A financial asset shall be measured at fair value through surplus or deficit unless it is measured at amortized cost in accordance with paragraph 40 or at fair value through net assets/equity in accordance with paragraph 41. However an entity may make an irrevocable election at initial recognition for particular investments in equity instruments that would otherwise be measured at fair value through surplus or deficit to present subsequent changes in fair value in net assets/equity (see paragraphs 106–107).**

Option to Designate a Financial Asset at Fair Value through Surplus or Deficit

44. **Despite paragraphs 39–43, an entity may, at initial recognition, irrevocably designate a financial asset as measured at fair value through surplus or deficit if doing so eliminates or significantly reduces a measurement or recognition inconsistency (sometimes referred to as an 'accounting mismatch') that**

would otherwise arise from measuring assets or liabilities or recognizing the gains and losses on them on different bases (see paragraphs AG91–AG94).

Classification of Financial Liabilities

45. **An entity shall classify all financial liabilities as subsequently measured at amortized cost, except for:**

    (a) **Financial liabilities at fair value through surplus or deficit. Such liabilities, including derivatives that are liabilities, shall be subsequently measured at fair value.**

    (b) **Financial liabilities that arise when a transfer of a financial asset does not qualify for derecognition or when the continuing involvement approach applies. Paragraphs 26 and 28 apply to the measurement of such financial liabilities.**

    (c) **Financial guarantee contracts. After initial recognition, an issuer of such a contract shall (unless paragraph 45(a) or (b) applies) subsequently measure it at the higher of:**

        (i) **The amount of the loss allowance determined in accordance with paragraphs 73–93; and**

        (ii) **The amount initially recognized (see paragraph 57) less, when appropriate, the cumulative amount of revenue recognized in accordance with the principles of IPSAS 47.**

    (d) **Commitments to provide a loan at a below-market interest rate. An issuer of such a commitment shall (unless paragraph 45(a) applies) subsequently measure it at the higher of:**

        (i) **The amount of the loss allowance determined in accordance with paragraphs 73–93; and**

        (ii) **The amount initially recognized (see paragraph 57) less, when appropriate, the cumulative amount of revenue recognized in accordance with the principles of IPSAS 47.**

    (e) **Contingent consideration recognized by an acquirer in a public sector combination to which IPSAS 40 applies. Such contingent consideration shall subsequently be measured at fair value with changes recognized in surplus or deficit.**

Option to Designate a Financial Liability at Fair Value through Surplus or Deficit

46. **An entity may, at initial recognition, irrevocably designate a financial liability as measured at fair value through surplus or deficit when permitted by paragraph 51, or when doing so results in more relevant information, because either:**

    (a) **It eliminates or significantly reduces a measurement or recognition inconsistency (sometimes referred to as 'an accounting mismatch') that would otherwise arise from measuring assets or liabilities or recognizing the gains and losses on them on different bases (see paragraphs AG91–AG94); or**

    (b) **A group of financial liabilities or financial assets and financial liabilities is managed and its performance is evaluated on a fair value basis, in accordance with a documented risk management or investment strategy, and information about the group is provided internally on that basis to the entity's key management personnel (as defined in IPSAS 20, Related Party Disclosures), for example, the entity's governing body and chief executive officer (see paragraphs AG95–AG98).**

Embedded Derivatives

47. An embedded derivative is a component of a hybrid contract that also includes a non-derivative host—with the effect that some of the cash flows of the combined instrument vary in a way similar to a stand-alone

derivative. An embedded derivative causes some or all of the cash flows that otherwise would be required by the contract to be modified according to a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract. A derivative that is attached to a *financial instrument* but is contractually transferable independently of that instrument, or has a different counterparty, is not an embedded derivative, but a separate financial instrument.

Hybrid Contracts with Financial Asset Hosts

48. **If a hybrid contract contains a host that is an asset within the scope of this Standard, an entity shall apply the requirements in paragraphs 39–44 to the entire hybrid contract.**

Other Hybrid Contracts

49. **If a hybrid contract contains a host that is not an asset within the scope of this Standard, an embedded derivative shall be separated from the host and accounted for as a derivative under this Standard if, and only if:**

    (a) **The economic characteristics and risks of the embedded derivative are not closely related to the economic characteristics and risks of the host (see paragraphs AG103 and AG106);**

    (b) **A separate instrument with the same terms as the embedded derivative would meet the definition of a derivative; and**

    (c) **The hybrid contract is not measured at fair value with changes in fair value recognized in surplus or deficit (i.e., a derivative that is embedded in a financial liability at fair value through surplus or deficit is not separated).**

50. **If an embedded derivative is separated, the host contract shall be accounted for in accordance with the appropriate Standards. This Standard does not address whether an embedded derivative shall be presented separately in the statement of financial position.**

51. **Despite paragraphs 49 and 50, if a contract contains one or more embedded derivatives and the host is not an asset within the scope of this Standard, an entity may designate the entire hybrid contract as at fair value through surplus or deficit unless:**

    (a) **The embedded derivative(s) do(es) not significantly modify the cash flows that otherwise would be required by the contract; or**

    (b) **It is clear with little or no analysis when a similar hybrid instrument is first considered that separation of the embedded derivative(s) is prohibited, such as a prepayment option embedded in a loan that permits the holder to prepay the loan for approximately its amortized cost.**

52. **If an entity is required by this Standard to separate an embedded derivative from its host, but is unable to measure the embedded derivative separately either at acquisition or at the end of a subsequent financial reporting period, it shall designate the entire hybrid contract as at fair value through surplus or deficit.**

53. If an entity is unable to measure reliably the fair value of an embedded derivative on the basis of its terms and conditions, the fair value of the embedded derivative is the difference between the fair value of the hybrid contract and the fair value of the host. If the entity is unable to measure the fair value of the embedded derivative using this method, paragraph 52 applies and the hybrid contract is designated as at fair value through surplus or deficit.

Reclassification

54. **When, and only when, an entity changes its management model for financial assets it shall reclassify all affected financial assets in accordance with paragraphs 39–43. See paragraphs 94–100, AG111–AG113 and AG220–AG221 for additional guidance on reclassifying financial assets.**

55. **An entity shall not reclassify any financial liability.**

56. The following changes in circumstances are not reclassifications for the purposes of paragraphs 54–55:

    (a) An item that was previously a designated and effective hedging instrument in a cash flow hedge or net investment hedge no longer qualifies as such;

    (b) An item becomes a designated and effective hedging instrument in a cash flow hedge or net investment hedge; and

    (c) Changes in measurement in accordance with paragraphs 152–155.

Measurement

Initial Measurement

57. **Except for short-term receivables and payables within the scope of paragraph 60, at initial recognition, an entity shall measure a financial asset or financial liability at its fair value plus or minus, in the case of a financial asset or financial liability not at fair value through surplus or deficit, transaction costs that are directly attributable to the acquisition or issue of the financial asset or financial liability.**

58. **However, if the fair value of the financial asset or financial liability at initial recognition differs from the transaction price, an entity shall apply paragraph AG117.**

59. When an entity uses settlement date accounting for an asset that is subsequently measured at amortized cost, the asset is recognized initially at its fair value on the trade date (see paragraphs AG17–AG20).

60. Despite the requirement in paragraph 57, at initial recognition, an entity may measure short-term receivables at their transaction consideration (as defined in IPSAS 47) if the short-term receivables do not contain a significant financing component (in accordance with IPSAS 47, or when the entity applies the practical expedient in paragraph 126 of IPSAS 47). An entity may measure short-term payables at the transaction consideration if the effect of discounting is immaterial.

Subsequent Measurement of Financial Assets

61. **After initial recognition, an entity shall measure a financial asset in accordance with paragraphs 39–44 at:**

    (a) **Amortized cost;**

    (b) **Fair value through net assets/equity; or**

    (c) **Fair value through surplus or deficit.**

62. **An entity shall apply the impairment requirements in paragraphs 73–93 to financial assets that are measured at amortized cost in accordance with paragraph 40 and to financial assets that are measured at fair value through net assets/equity in accordance with paragraph 41.**

63. **An entity shall apply the hedge accounting requirements in paragraphs 137–143 (and, if applicable, paragraphs 99–105 of IPSAS 29, *Financial Instruments: Recognition and Measurement*) for the fair**

value hedge accounting for a portfolio hedge of interest rate risk) to a financial asset that is designated as a hedged item.[2]

Subsequent Measurement of Financial Liabilities

64. **After initial recognition, an entity shall measure a financial liability in accordance with paragraphs 45–46.**

65. **An entity shall apply the hedge accounting requirements in paragraphs 137–143 (and, if applicable, paragraphs 99–105 of IPSAS 29 for the fair value hedge accounting for a portfolio hedge of interest rate risk) to a financial liability that is designated as a hedged item.**

Fair Value Measurement Considerations

66. In determining the fair value of a financial asset or a financial liability for the purpose of applying this Standard, IPSAS 28 or IPSAS 30, an entity shall apply IPSAS 46 and paragraphs AG143A–AG143AB of Appendix A.

67. [Deleted]

68. [Deleted]

Amortized Cost Measurement

Financial Assets

Effective Interest Method

69. **Interest revenue shall be calculated by using the effective interest method (see paragraphs 9 and AG156–AG162). This shall be calculated by applying the effective interest rate to the gross carrying amount of a financial asset except for:**

    (a) **Purchased or originated credit-impaired financial assets. For those financial assets, the entity shall apply the credit-adjusted effective interest rate to the amortized cost of the financial asset from initial recognition.**

    (b) **(Financial assets that are not purchased or originated credit-impaired financial assets but subsequently have become credit-impaired financial assets. For those financial assets, the entity shall apply the effective interest rate to the amortized cost of the financial asset in subsequent reporting periods.**

70. An entity that, in a reporting period, calculates interest revenue by applying the effective interest method to the amortized cost of a financial asset in accordance with paragraph 69(b), shall, in subsequent reporting periods, calculate the interest revenue by applying the effective interest rate to the gross carrying amount if the credit risk on the financial instrument improves so that the financial asset is no longer credit-impaired and the improvement can be related objectively to an event occurring after the requirements in paragraph 69(b) were applied (such as an improvement in the borrower's credit rating).

Modification of Contractual Cash Flows

71. When the contractual cash flows of a financial asset are renegotiated or otherwise modified and the renegotiation or modification does not result in the derecognition of that financial asset in accordance with this Standard, an entity shall recalculate the gross carrying amount of the financial asset and shall recognize

[2] In accordance with paragraph 179, an entity may choose as its accounting policy to continue to apply the hedge accounting requirements in IPSAS 29 instead of the requirements in paragraphs 113-155 of this Standard. If an entity has made this election, the references in this Standard to particular hedge accounting requirements in paragraphs 113-155 are not relevant. Instead the entity applies the relevant hedge accounting requirements in IPSAS 29.

a modification gain or loss in surplus or deficit. The gross carrying amount of the financial asset shall be recalculated as the present value of the renegotiated or modified contractual cash flows that are discounted at the financial asset's original effective interest rate (or credit-adjusted effective interest rate for purchased or originated credit-impaired financial assets) or, when applicable, the revised effective interest rate calculated in accordance with paragraph 139. Any costs or fees incurred adjust the carrying amount of the modified financial asset and are amortized over the remaining term of the modified financial asset.

Write-off

72. An entity shall directly reduce the gross carrying amount of a financial asset when the entity has no reasonable expectations of recovering a financial asset in its entirety or a portion thereof. A write-off constitutes a derecognition event (see paragraph AG37(r)).

Changes in the Basis for Determining the Contractual Cash Flows as a Result of Interest Rate Benchmark Reform

72A. An entity shall apply paragraphs 72B–72E to a financial asset or financial liability if, and only if, the basis for determining the contractual cash flows of that financial asset or financial liability changes as a result of interest rate benchmark reform. For this purpose, the term 'interest rate benchmark reform' refers to the market-wide reform of an interest rate benchmark as described in paragraph 155B.

72B. The basis for determining the contractual cash flows of a financial asset or financial liability can change:

(a) By amending the contractual terms specified at the initial recognition of the financial instrument (for example, the contractual terms are amended to replace the referenced interest rate benchmark with an alternative benchmark rate);

(b) In a way that was not considered by—or contemplated in—the contractual terms at the initial recognition of the financial instrument, without amending the contractual terms (for example, the method for calculating the interest rate benchmark is altered without amending the contractual terms); and/or

(c) Because of the activation of an existing contractual term (for example, an existing fallback clause is triggered).

72C. As a practical expedient, an entity shall apply paragraph AG160 to account for a change in the basis for determining the contractual cash flows of a financial asset or financial liability that is required by interest rate benchmark reform. This practical expedient applies only to such changes and only to the extent the change is required by interest rate benchmark reform (see also paragraph 72E). For this purpose, a change in the basis for determining the contractual cash flows is required by interest rate benchmark reform if, and only if, both these conditions are met:

(a) The change is necessary as a direct consequence of interest rate benchmark reform; and

(b) The new basis for determining the contractual cash flows is economically equivalent to the previous basis (i.e., the basis immediately preceding the change).

72D. Examples of changes that give rise to a new basis for determining the contractual cash flows that is economically equivalent to the previous basis (i.e., the basis immediately preceding the change) are:

(a) The replacement of an existing interest rate benchmark used to determine the contractual cash flows of a financial asset or financial liability with an alternative benchmark rate—or the implementation of such a reform of an interest rate benchmark by altering the method used to calculate the interest rate benchmark—with the addition of a fixed spread necessary to compensate for the basis difference between the existing interest rate benchmark and the alternative benchmark rate;

(b) Changes to the reset period, reset dates or the number of days between coupon payment dates in order to implement the reform of an interest rate benchmark; and

(c) The addition of a fallback provision to the contractual terms of a financial asset or financial liability to enable any change described in (a) and (b) above to be implemented.

72E. If changes are made to a financial asset or financial liability in addition to changes to the basis for determining the contractual cash flows required by interest rate benchmark reform, an entity shall first apply the practical expedient in paragraph 72C to the changes required by interest rate benchmark reform. The entity shall then apply the applicable requirements in this Standard to any additional changes to which the practical expedient does not apply. If the additional change does not result in the derecognition of the financial asset or financial liability, the entity shall apply paragraph 71 or paragraph AG161, as applicable, to account for that additional change. If the additional change results in the derecognition of the financial asset or financial liability, the entity shall apply the derecognition requirements.

Impairment

Recognition of Expected Credit Losses

General Approach

73. **An entity shall recognize a loss allowance for *expected credit losses* on a financial asset that is measured in accordance with paragraphs 40 or 41, a lease receivable, or a loan commitment and a financial guarantee contract to which the impairment requirements apply in accordance with paragraphs 2(g), 45(c) or 45(d).**

74. An entity shall apply the impairment requirements for the recognition and measurement of a loss allowance for financial assets that are measured at fair value through net assets/equity in accordance with paragraph 41. However, the loss allowance shall be recognized in net assets/equity and shall not reduce the carrying amount of the financial asset in the statement of financial position.

75. **Subject to paragraphs 85–88, at each reporting date, an entity shall measure the loss allowance for a financial instrument at an amount equal to the lifetime expected credit losses if the credit risk on that financial instrument has increased significantly since initial recognition.**

76. The objective of the impairment requirements is to recognize lifetime expected credit losses for all financial instruments for which there have been significant increases in credit risk since initial recognition — whether assessed on an individual or collective basis — considering all reasonable and supportable information, including that which is forward-looking.

77. **Subject to paragraphs 85–88, if, at the reporting date, the credit risk on a financial instrument has not increased significantly since initial recognition, an entity shall measure the loss allowance for that financial instrument at an amount equal to 12-month expected credit losses.**

78. For loan commitments and financial guarantee contracts, the date that the entity becomes a party to the irrevocable commitment shall be considered to be the date of initial recognition for the purposes of applying the impairment requirements.

79. If an entity has measured the loss allowance for a financial instrument at an amount equal to lifetime expected credit losses in the previous reporting period, but determines at the current reporting date that paragraph 75 is no longer met, the entity shall measure the loss allowance at an amount equal to 12-month expected credit losses at the current reporting date.

80. An entity shall recognize in surplus or deficit, as an *impairment gain or loss*, the amount of expected credit losses (or reversal) that is required to adjust the loss allowance at the reporting date to the amount that is required to be recognized in accordance with this Standard.

Determining Significant Increases in Credit Risk

81. At each reporting date, an entity shall assess whether the credit risk on a financial instrument has increased significantly since initial recognition. When making the assessment, an entity shall use the change in the risk of a default occurring over the expected life of the financial instrument instead of the change in the amount of expected credit losses. To make that assessment, an entity shall compare the risk of a default occurring on the financial instrument as at the reporting date with the risk of a default occurring on the financial instrument as at the date of initial recognition and consider reasonable and supportable information, that is available without undue cost or effort, that is indicative of significant increases in credit risk since initial recognition.

82. An entity may assume that the credit risk on a financial instrument has not increased significantly since initial recognition if the financial instrument is determined to have low credit risk at the reporting date (see paragraphs AG186–AG188).

83. If reasonable and supportable forward-looking information is available without undue cost or effort, an entity cannot rely solely on past due information when determining whether credit risk has increased significantly since initial recognition. However, when information that is more forward-looking than past due status (either on an individual or a collective basis) is not available without undue cost or effort, an entity may use past due information to determine whether there have been significant increases in credit risk since initial recognition. Regardless of the way in which an entity assesses significant increases in credit risk, there is a rebuttable presumption that the credit risk on a financial asset has increased significantly since initial recognition when contractual payments are more than 30 days past due. An entity can rebut this presumption if the entity has reasonable and supportable information that is available without undue cost or effort, that demonstrates that the credit risk has not increased significantly since initial recognition even though the contractual payments are more than 30 days past due. When an entity determines that there have been significant increases in credit risk before contractual payments are more than 30 days past due, the rebuttable presumption does not apply.

Modified Financial Assets

84. If the contractual cash flows on a financial asset have been renegotiated or modified and the financial asset was not derecognized, an entity shall assess whether there has been a significant increase in the credit risk of the financial instrument in accordance with paragraph 75 by comparing:

    (a) The risk of a default occurring at the reporting date (based on the modified contractual terms); and

    (b) The risk of a default occurring at initial recognition (based on the original, unmodified contractual terms).

Purchased or Originated Credit-Impaired Financial Assets

85. **Despite paragraphs 75 and 77, at the reporting date, an entity shall only recognize the cumulative changes in lifetime expected credit losses since initial recognition as a loss allowance for purchased or originated credit-impaired financial assets.**

86. At each reporting date, an entity shall recognize in surplus or deficit the amount of the change in lifetime expected credit losses as an impairment gain or loss. An entity shall recognize favorable changes in lifetime expected credit losses as an impairment gain, even if the lifetime expected credit losses are less than the amount of expected credit losses that were included in the estimated cash flows on initial recognition.

Simplified Approach for Receivables and Binding Arrangement Assets

87. **Despite paragraphs 75 and 77, an entity shall always measure the loss allowance at an amount equal to lifetime expected credit losses for:**

    (a) **Receivables or binding arrangement assets that result from transactions within the scope of IPSAS 47 and that:**

        (i) **Do not contain a significant financing component in accordance with IPSAS 47 (or when the entity applies the practical expedient in accordance with paragraph 126 of IPSAS 47);**

        (ii) **Contain a significant financing component in accordance with IPSAS 47, if the entity chooses as its accounting policy to measure the loss allowance at an amount equal to lifetime expected credit losses. That accounting policy shall be applied to all receivables or binding arrangement assets but may be applied separately to receivables and binding arrangement assets.**

    (b) **Lease receivables that result from transactions that are within the scope of IPSAS 43, if the entity chooses as its accounting policy to measure the loss allowance at an amount equal to lifetime expected credit losses. That accounting policy shall be applied to all lease receivables but may be applied separately to finance and operating lease receivables.**

88. An entity may select its accounting policy for trade receivables and lease receivables independently of each other.

89. The requirements for purchased or originated credit-impaired financial assets (see paragraphs 9 and 85 to 86) do not apply to short-term receivables.

Measurement of Expected Credit Losses

90. **An entity shall measure expected credit losses of a financial instrument in a way that reflects:**

    (a) **An unbiased and probability-weighted amount that is determined by evaluating a range of possible outcomes;**

    (b) **The time value of money; and**

    (c) **Reasonable and supportable information that is available without undue cost or effort at the reporting date about past events, current conditions and forecasts of future economic conditions.**

91. When measuring expected credit losses, an entity need not necessarily identify every possible scenario. However, it shall consider the risk or probability that a credit loss occurs by reflecting the possibility that a credit loss occurs and the possibility that no credit loss occurs, even if the possibility of a credit loss occurring is very low.

92. The maximum period to consider when measuring expected credit losses is the maximum contractual period (including extension options) over which the entity is exposed to credit risk and not a longer period, even if that longer period is consistent with business practice.

93. However, some financial instruments include both a loan and an undrawn commitment component and the entity's contractual ability to demand repayment and cancel the undrawn commitment does not limit the entity's exposure to credit losses to the contractual notice period. For such financial instruments, and only those financial instruments, the entity shall measure expected credit losses over the period that the entity is exposed to credit risk and expected credit losses would not be mitigated by credit risk management actions, even if that period extends beyond the maximum contractual period.

Reclassification of Financial Assets

94. **If an entity reclassifies financial assets in accordance with paragraph 54, it shall apply the reclassification prospectively from the reclassification date. The entity shall not restate any previously recognized gains, losses (including impairment gains or losses) or interest. Paragraphs 95–100 set out the requirements for reclassifications.**

95. **If an entity reclassifies a financial asset out of the amortized cost measurement category and into the fair value through surplus or deficit measurement category, its fair value is measured at the reclassification date. Any gain or loss arising from a difference between the previous amortized cost of the financial asset and fair value is recognized in surplus or deficit.**

96. **If an entity reclassifies a financial asset out of the fair value through surplus or deficit measurement category and into the amortized cost measurement category, its fair value at the reclassification date becomes its new gross carrying amount. (See paragraph AG221 for guidance on determining an effective interest rate and a loss allowance at the reclassification date.)**

97. **If an entity reclassifies a financial asset out of the amortized cost measurement category and into the fair value through net assets/equity measurement category, its fair value is measured at the reclassification date. Any gain or loss arising from a difference between the previous amortized cost of the financial asset and fair value is recognized in net assets/equity. The effective interest rate and the measurement of expected credit losses are not adjusted as a result of the reclassification. (See paragraph AG220.)**

98. **If an entity reclassifies a financial asset out of the fair value through net assets/equity measurement category and into the amortized cost measurement category, the financial asset is reclassified at its fair value at the reclassification date. However, the cumulative gain or loss previously recognized in net assets/equity is removed from net assets/equity and adjusted against the fair value of the financial asset at the reclassification date. As a result, the financial asset is measured at the reclassification date as if it had always been measured at amortized cost. This adjustment affects net assets/equity but does not affect surplus or deficit and therefore is not a reclassification adjustment (see IPSAS 1, *Presentation of Financial Statements*). The effective interest rate and the measurement of expected credit losses are not adjusted as a result of the reclassification. (See paragraph AG220.)**

99. **If an entity reclassifies a financial asset out of the fair value through surplus or deficit measurement category and into the fair value through net assets/equity measurement category, the financial asset continues to be measured at fair value. (See paragraph AG221 for guidance on determining an effective interest rate and a loss allowance at the reclassification date.)**

100. **If an entity reclassifies a financial asset out of the fair value through net assets/equity measurement category and into the fair value through surplus or deficit measurement category, the financial asset continues to be measured at fair value. The cumulative gain or loss previously recognized in net assets/equity is reclassified from net assets/equity to surplus or deficit as a reclassification adjustment (see IPSAS 1) at the reclassification date.**

Gains and Losses

101. **A gain or loss on a financial asset or financial liability that is measured at fair value shall be recognized in surplus or deficit unless:**

    (a) **It is part of a hedging relationship (see paragraphs 137–143 and, if applicable, paragraphs 99–105 of IPSAS 29 for the fair value hedge accounting for a portfolio hedge of interest rate risk);**

(b) **It is an investment in an equity instrument and the entity has elected to present gains and losses on that investment in net assets/equity in accordance with paragraph 106;**

(c) **It is a financial liability designated as at fair value through surplus or deficit and the entity is required to present the effects of changes in the liability's credit risk in net assets/equity in accordance with paragraph 108; or**

(d) **It is a financial asset measured at fair value through net assets/equity in accordance with paragraph 41 and the entity is required to recognize some changes in fair value in net assets/equity in accordance with paragraph 111.**

102. Dividends or similar distributions are recognized in surplus or deficit only when:

(a) The entity's right to receive payment of the dividend is established;

(b) It is probable that the economic benefits associated with the dividend will flow to the entity; and

(c) The amount of the dividend can be measured reliably.

103. **A gain or loss on a financial asset that is measured at amortized cost and is not part of a hedging relationship (see paragraphs 137–143 and, if applicable, paragraphs 99–105 of IPSAS 29 for the fair value hedge accounting for a portfolio hedge of interest rate risk) shall be recognized in surplus or deficit when the financial asset is derecognized, reclassified in accordance with paragraph 95, through the amortization process or in order to recognize impairment gains or losses. An entity shall apply paragraphs 95 and 97 if it reclassifies financial assets out of the amortized cost measurement category. A gain or loss on a financial liability that is measured at amortized cost and is not part of a hedging relationship (see paragraphs 137–143 and, if applicable, paragraphs 99–105 of IPSAS 29 for the fair value hedge accounting for a portfolio hedge of interest rate risk) shall be recognized in surplus or deficit when the financial liability is derecognized and through the amortization process. (See paragraph AG224 for guidance on foreign exchange gains or losses.)**

104. **A gain or loss on financial assets or financial liabilities that are hedged items in a hedging relationship shall be recognized in accordance with paragraphs 137–143 and, if applicable, paragraphs 99–105 of IPSAS 29 for the fair value hedge accounting for a portfolio hedge of interest rate risk.**

105. **If an entity recognizes financial assets using settlement date accounting (see paragraphs 11, AG17 and AG20), any change in the fair value of the asset to be received during the period between the trade date and the settlement date is not recognized for assets measured at amortized cost. For assets measured at fair value, however, the change in fair value shall be recognized in surplus or deficit or in net assets/equity, as appropriate in accordance with paragraph 101. The trade date shall be considered the date of initial recognition for the purposes of applying the impairment requirements.**

Investments in Equity Instruments

106. **At initial recognition, an entity may make an irrevocable election to present in net assets/equity subsequent changes in the fair value of an investment in an equity instrument within the scope of this Standard that is neither held for trading nor contingent consideration recognized by an acquirer in a public sector combination. (See paragraph AG226 for guidance on foreign exchange gains or losses.)**

107. If an entity makes the election in paragraph 106, it shall recognize in surplus or deficit dividends or similar distributions from that investment in accordance with paragraph 102.

Liabilities Designated as at Fair Value through Surplus or Deficit

108. **An entity shall present a gain or loss on a financial liability that is designated as at fair value through surplus or deficit in accordance with paragraph 46 or paragraph 51 as follows:**

(a) **The amount of change in the fair value of the financial liability that is attributable to changes in the credit risk of that liability shall be presented in net assets/equity (see paragraphs AG236–AG243), and**

(b) **The remaining amount of change in the fair value of the liability shall be presented in surplus or deficit**

unless the treatment of the effects of changes in the liability's credit risk described in (a) would create or enlarge an accounting mismatch in surplus or deficit (in which case paragraph 109 applies). Paragraphs AG228–AG230 and AG233–AG235 provide guidance on determining whether an accounting mismatch would be created or enlarged.

109. **If the requirements in paragraph 108 would create or enlarge an accounting mismatch in surplus or deficit, an entity shall present all gains or losses on that liability (including the effects of changes in the credit risk of that liability) in surplus or deficit.**

110. Despite the requirements in paragraphs 108 and 109, an entity shall present in surplus or deficit all gains and losses on loan commitments and financial guarantee contracts that are designated as at fair value through surplus or deficit.

Assets Measured at Fair Value through Net Assets/Equity

111. **A gain or loss on a financial asset measured at fair value through net assets/equity in accordance with paragraph 41 shall be recognized in net assets/equity, except for impairment gains or losses (see paragraphs 73–93) and foreign exchange gains and losses (see paragraphs AG224–AG225), until the financial asset is derecognized or reclassified. When the financial asset is derecognized the cumulative gain or loss previously recognized in net assets/equity is reclassified from net assets/equity to surplus or deficit as a reclassification adjustment (see paragraphs 125A–125C of IPSAS 1). If the financial asset is reclassified out of the fair value through net assets/equity measurement category, the entity shall account for the cumulative gain or loss that was previously recognized in net assets/equity in accordance with paragraphs 98 and 100. Interest calculated using the effective interest method is recognized in surplus or deficit.**

112. **As described in paragraph 111, if a financial asset is measured at fair value through net assets/equity in accordance with paragraph 41, the amounts that are recognized in surplus or deficit are the same as the amounts that would have been recognized in surplus or deficit if the financial asset had been measured at amortized cost.**

Hedge Accounting

Objective and Scope of Hedge Accounting

113. The objective of hedge accounting is to represent, in the financial statements, the effect of an entity's risk management activities that use financial instruments to manage exposures arising from particular risks that could affect surplus or deficit (or net assets/equity, in the case of investments in equity instruments for which an entity has elected to present changes in fair value in net assets/equity in accordance with paragraph 106). This approach aims to convey the context of hedging instruments for which hedge accounting is applied in order to allow insight into their purpose and effect.

114. An entity may choose to designate a hedging relationship between a hedging instrument and a hedged item in accordance with paragraphs 116–128 and AG244–AG274. For hedging relationships that meet the qualifying criteria, an entity shall account for the gain or loss on the hedging instrument and the hedged item in accordance with paragraphs 130–143 and AG294–AG321. When the hedged item is a group of items, an entity shall comply with the additional requirements in paragraphs 146–151 and AG333–AG348.

115. For a fair value hedge of the interest rate exposure of a portfolio of financial assets or financial liabilities (and only for such a hedge), an entity may apply the hedge accounting requirements in IPSAS 29 instead of those in this Standard. In that case, the entity must also apply the specific requirements for the fair value hedge accounting for a portfolio hedge of interest rate risk and designate as the hedged item a portion that is a currency amount (see paragraphs 91, 100 and AG157–AG175 of IPSAS 29).

Hedging Instruments

Qualifying Instruments

116. **A derivative measured at fair value through surplus or deficit may be designated as a hedging instrument, except for some written options (see paragraph AG247).**

117. **A non-derivative financial asset or a non-derivative financial liability measured at fair value through surplus or deficit may be designated as a hedging instrument unless it is a financial liability designated as at fair value through surplus or deficit for which the amount of its change in fair value that is attributable to changes in the credit risk of that liability is presented in net assets/equity in accordance with paragraph 108. For a hedge of foreign currency risk, the foreign currency risk component of a non-derivative financial asset or a non-derivative financial liability may be designated as a hedging instrument provided that it is not an investment in an equity instrument for which an entity has elected to present changes in fair value in net assets/equity in accordance with paragraph 106.**

118. **For hedge accounting purposes, only contracts with a party external to the reporting entity (i.e., external to the economic entity or individual entity that is being reported on) can be designated as hedging instruments.**

Designation of Hedging Instruments

119. A qualifying instrument must be designated in its entirety as a hedging instrument. The only exceptions permitted are:

(a) Separating the intrinsic value and time value of an option contract and designating as the hedging instrument only the change in intrinsic value of an option and not the change in its time value (see paragraphs 144 and AG322–AG326);

(b) Separating the forward element and the spot element of a forward contract and designating as the hedging instrument only the change in the value of the spot element of a forward contract and not the forward element; similarly, the foreign currency basis spread may be separated and excluded from the designation of a financial instrument as the hedging instrument (see paragraphs 145 and AG327–AG332); and

(c) A proportion of the entire hedging instrument, such as 50 percent of the nominal amount, may be designated as the hedging instrument in a hedging relationship. However, a hedging instrument may not be designated for a part of its change in fair value that results from only a portion of the time period during which the hedging instrument remains outstanding.

120. An entity may view in combination, and jointly designate as the hedging instrument, any combination of the following (including those circumstances in which the risk or risks arising from some hedging instruments offset those arising from others):

(a) Derivatives or a proportion of them; and

(b) Non-derivatives or a proportion of them.

121. However, a derivative instrument that combines a written option and a purchased option (for example, an interest rate collar) does not qualify as a hedging instrument if it is, in effect, a net written option at the date of designation (unless it qualifies in accordance with paragraph AG247). Similarly, two or more instruments (or proportions of them) may be jointly designated as the hedging instrument only if, in combination, they are not, in effect, a net written option at the date of designation (unless it qualifies in accordance with paragraph AG247).

Hedged Items

Qualifying Items

122. **A hedged item can be a recognized asset or liability, an unrecognized firm commitment, a forecast transaction or a net investment in a foreign operation. The hedged item can be:**

(a) **A single item; or**

(b) **A group of items (subject to paragraphs 146–151 and AG333–AG348).**

A hedged item can also be a component of such an item or group of items (see paragraphs 128 and AG256–AG274).

123. **The hedged item must be reliably measurable.**

124. **If a hedged item is a forecast transaction (or a component thereof), that transaction must be highly probable.**

125. **An aggregated exposure that is a combination of an exposure that could qualify as a hedged item in accordance with paragraph 122 and a derivative may be designated as a hedged item (see paragraphs AG252–AG253). This includes a forecast transaction of an aggregated exposure (i.e., uncommitted but anticipated future transactions that would give rise to an exposure and a derivative) if that aggregated exposure is highly probable and, once it has occurred and is therefore no longer forecast, is eligible as a hedged item.**

126. **For hedge accounting purposes, only assets, liabilities, firm commitments or highly probable forecast transactions with a party external to the reporting entity can be designated as hedged items. Hedge accounting can be applied to transactions between entities in the same economic entity only in the individual or separate financial statements of those entities and not in the consolidated financial statements of the economic entity, except for:**

(a) **The consolidated financial statements of an investment entity, as defined in IPSAS 35, where transactions between an investment entity and its controlled entities measured at fair value through surplus or deficit will not be eliminated in the consolidated financial statements; or**

(b) **The consolidated financial statements of a controlling entity of an investment entity, as defined in IPSAS 35 that is not itself an investment entity, where transactions between a controlled investment entity and the investments of a controlled investment entity measured at fair value through surplus or deficit will not be eliminated in the consolidated financial statements.**

127. However, as an exception to paragraph 126, the foreign currency risk of a monetary item within an economic entity (for example, a payable/receivable between two controlled entities) may qualify as a hedged item in the consolidated financial statements if it results in an exposure to foreign exchange rate gains or losses that are not fully eliminated on consolidation in accordance with IPSAS 4, *The Effects of Changes in Foreign Exchange Rates*. In accordance with IPSAS 4, foreign exchange rate gains and losses on monetary items within an economic entity are not fully eliminated on consolidation when the monetary item is transacted between two entities within the economic entity that have different functional currencies. In addition, the foreign currency risk of a highly probable forecast transaction within the economic entity may qualify as a hedged item in consolidated financial statements provided that the transaction is denominated in a currency other than the functional currency of the entity entering into that transaction and the foreign currency risk will affect consolidated surplus or deficit.

Designation of Hedged Items

128. An entity may designate an item in its entirety or a component of an item as the hedged item in a hedging relationship. An entire item comprises all changes in the cash flows or fair value of an item. A component comprises less than the entire fair value change or cash flow variability of an item. In that case, an entity may designate only the following types of components (including combinations) as hedged items:

(a) Only changes in the cash flows or fair value of an item attributable to a specific risk or risks (risk component), provided that, based on an assessment within the context of the particular market structure, the risk component is separately identifiable and reliably measurable (see paragraphs AG257–AG264). Risk components include a designation of only changes in the cash flows or the fair value of a hedged item above or below a specified price or other variable (a one-sided risk).

(b) One or more selected contractual cash flows.

(c) Components of a nominal amount, i.e., a specified part of the amount of an item (see paragraphs AG265–AG269).

Qualifying Criteria for Hedge Accounting

129. **A hedging relationship qualifies for hedge accounting only if all of the following criteria are met:**

(a) **The hedging relationship consists only of eligible hedging instruments and eligible hedged items.**

(b) **At the inception of the hedging relationship there is formal designation and documentation of the hedging relationship and the entity's risk management objective and strategy for undertaking the hedge. That documentation shall include identification of the hedging instrument, the hedged item, the nature of the risk being hedged and how the entity will assess whether the hedging relationship meets the hedge effectiveness requirements (including its analysis of the sources of hedge ineffectiveness and how it determines the hedge ratio).**

(c) **The hedging relationship meets all of the following hedge effectiveness requirements:**

(i) **There is an economic relationship between the hedged item and the hedging instrument (see paragraphs AG278–AG280);**

(ii) **The effect of credit risk does not dominate the value changes that result from that economic relationship (see paragraphs AG281–AG282); and**

(iii) **The hedge ratio of the hedging relationship is the same as that resulting from the quantity of the hedged item that the entity actually hedges and the quantity of the hedging instrument that the entity actually uses to hedge that quantity of hedged item. However,**

that designation shall not reflect an imbalance between the weightings of the hedged item and the hedging instrument that would create hedge ineffectiveness (irrespective of whether recognized or not) that could result in an accounting outcome that would be inconsistent with the purpose of hedge accounting (see paragraphs AG283–AG285).

Accounting for Qualifying Hedging Relationships

130. **An entity applies hedge accounting to hedging relationships that meet the qualifying criteria in paragraph 129 (which include the entity's decision to designate the hedging relationship).**

131. **There are three types of hedging relationships:**

(a) **Fair value hedge: a hedge of the exposure to changes in fair value of a recognized asset or liability or an unrecognized firm commitment, or a component of any such item, that is attributable to a particular risk and could affect surplus or deficit.**

(b) **Cash flow hedge: a hedge of the exposure to variability in cash flows that is attributable to a particular risk associated with all, or a component of, a recognized asset or liability (such as all or some future interest payments on variable-rate debt) or a highly probable forecast transaction, and could affect surplus or deficit.**

(c) **Hedge of a net investment in a foreign operation as defined in IPSAS 4.**

132. If the hedged item is an equity instrument for which an entity has elected to present changes in fair value in net assets/equity in accordance with paragraph 106, the hedged exposure referred to in paragraph 131(a) must be one that could affect net assets/equity. In that case, and only in that case, the recognized hedge ineffectiveness is presented in net assets/equity.

133. A hedge of the foreign currency risk of a firm commitment may be accounted for as a fair value hedge or a cash flow hedge.

134. **If a hedging relationship ceases to meet the hedge effectiveness requirement relating to the hedge ratio (see paragraph 129(c)(iii)) but the risk management objective for that designated hedging relationship remains the same, an entity shall adjust the hedge ratio of the hedging relationship so that it meets the qualifying criteria again (this is referred to in this Standard as 'rebalancing'—see paragraphs AG300–AG314).**

135. **An entity shall discontinue hedge accounting prospectively only when the hedging relationship (or a part of a hedging relationship) ceases to meet the qualifying criteria (after taking into account any rebalancing of the hedging relationship, if applicable). This includes instances when the hedging instrument expires or is sold, terminated or exercised. For this purpose, the replacement or rollover of a hedging instrument into another hedging instrument is not an expiration or termination if such a replacement or rollover is part of, and consistent with, the entity's documented risk management objective. Additionally, for this purpose there is not an expiration or termination of the hedging instrument if:**

(a) **As a consequence of laws or regulations or the introduction of laws or regulations, the parties to the hedging instrument agree that one or more clearing counterparties replace their original counterparty to become the new counterparty to each of the parties. For this purpose, a clearing counterparty is a central counterparty (sometimes called a 'clearing organization' or 'clearing agency') or an entity or entities, for example, a clearing member of a clearing organization or a client of a clearing member of a clearing organization, that are acting as a counterparty in order to effect clearing by a central counterparty. However, when the parties to the hedging instrument replace their original counterparties with different counterparties the requirement**

in this subparagraph is met only if each of those parties effects clearing with the same central counterparty.

(b) **Other changes, if any, to the hedging instrument are limited to those that are necessary to effect such a replacement of the counterparty. Such changes are limited to those that are consistent with the terms that would be expected if the hedging instrument were originally cleared with the clearing counterparty. These changes include changes in the collateral requirements, rights to offset receivables and payables balances, and charges levied.**

Discontinuing hedge accounting can either affect a hedging relationship in its entirety or only a part of it (in which case hedge accounting continues for the remainder of the hedging relationship).

136. An entity shall apply:

(a) Paragraph 139 when it discontinues hedge accounting for a fair value hedge for which the hedged item is (or is a component of) a financial instrument measured at amortized cost; and

(b) Paragraph 141 when it discontinues hedge accounting for cash flow hedges.

Fair Value Hedges

137. **As long as a fair value hedge meets the qualifying criteria in paragraph 129, the hedging relationship shall be accounted for as follows:**

(a) **The gain or loss on the hedging instrument shall be recognized in surplus or deficit (or net assets/equity, if the hedging instrument hedges an equity instrument for which an entity has elected to present changes in fair value in net assets/equity in accordance with paragraph 106).**

(b) **The hedging gain or loss on the hedged item shall adjust the carrying amount of the hedged item (if applicable) and be recognized in surplus or deficit. If the hedged item is a financial asset (or a component thereof) that is measured at fair value through net assets/equity in accordance with paragraph 41, the hedging gain or loss on the hedged item shall be recognized in surplus or deficit. However, if the hedged item is an equity instrument for which an entity has elected to present changes in fair value in net assets/equity in accordance with paragraph 106, those amounts shall remain in net assets/equity. When a hedged item is an unrecognized firm commitment (or a component thereof), the cumulative change in the fair value of the hedged item subsequent to its designation is recognized as an asset or a liability with a corresponding gain or loss recognized in surplus or deficit.**

138. When a hedged item in a fair value hedge is a firm commitment (or a component thereof) to acquire an asset or assume a liability, the initial carrying amount of the asset or the liability that results from the entity meeting the firm commitment is adjusted to include the cumulative change in the fair value of the hedged item that was recognized in the statement of financial position.

139. Any adjustment arising from paragraph 137(b) shall be amortized to surplus or deficit if the hedged item is a financial instrument (or a component thereof) measured at amortized cost. Amortization may begin as soon as an adjustment exists and shall begin no later than when the hedged item ceases to be adjusted for hedging gains and losses. The amortization is based on a recalculated effective interest rate at the date that amortization begins. In the case of a financial asset (or a component thereof) that is a hedged item and that is measured at fair value through net assets/equity in accordance with paragraph 41, amortization applies in the same manner but to the amount that represents the cumulative gain or loss previously recognized in accordance with paragraph 137(b) instead of by adjusting the carrying amount.

Cash Flow Hedges

140. **As long as a cash flow hedge meets the qualifying criteria in paragraph 129, the hedging relationship shall be accounted for as follows:**

(a) **The separate component of net assets/equity associated with the hedged item (cash flow hedge reserve) is adjusted to the lower of the following (in absolute amounts):**

(i) **The cumulative gain or loss on the hedging instrument from inception of the hedge; and**

(ii) **The cumulative change in fair value (present value) of the hedged item (i.e., the present value of the cumulative change in the hedged expected future cash flows) from inception of the hedge.**

(b) **The portion of the gain or loss on the hedging instrument that is determined to be an effective hedge (i.e., the portion that is offset by the change in the cash flow hedge reserve calculated in accordance with (a)) shall be recognized in net assets/equity.**

(c) **Any remaining gain or loss on the hedging instrument (or any gain or loss required to balance the change in the cash flow hedge reserve calculated in accordance with (a)) is hedge ineffectiveness that shall be recognized in surplus or deficit.**

(d) **The amount that has been accumulated in the cash flow hedge reserve in accordance with (a) shall be accounted for as follows:**

(i) **If a hedged forecast transaction subsequently results in the recognition of a non-financial asset or non-financial liability, or a hedged forecast transaction for a non-financial asset or a non-financial liability becomes a firm commitment for which fair value hedge accounting is applied, the entity shall remove that amount from the cash flow hedge reserve and include it directly in the initial cost or other carrying amount of the asset or the liability. This is not a reclassification adjustment (see IPSAS 1) and hence it does not affect net assets/equity.**

(ii) **For cash flow hedges other than those covered by (i), that amount shall be reclassified from the cash flow hedge reserve to surplus or deficit as a reclassification adjustment (see paragraphs 125A–125C of IPSAS 1) in the same period or periods during which the hedged expected future cash flows affect surplus or deficit (for example, in the periods that interest revenue or interest expense is recognized or when a forecast sale occurs).**

(iii) **However, if that amount is a loss and an entity expects that all or a portion of that loss will not be recovered in one or more future periods, it shall immediately reclassify the amount that is not expected to be recovered into surplus or deficit as a reclassification adjustment (see paragraphs 125A–125C of IPSAS 1).**

141. When an entity discontinues hedge accounting for a cash flow hedge (see paragraphs 135 and 136(b)) it shall account for the amount that has been accumulated in the cash flow hedge reserve in accordance with paragraph 140(a) as follows:

(a) If the hedged future cash flows are still expected to occur, that amount shall remain in the cash flow hedge reserve until the future cash flows occur or until paragraph 140(d)(iii) applies. When the future cash flows occur, paragraph 140(d) applies.

(b) If the hedged future cash flows are no longer expected to occur, that amount shall be immediately reclassified from the cash flow hedge reserve to surplus or deficit as a reclassification adjustment (see IPSAS 1). A hedged future cash flow that is no longer highly probable to occur may still be expected to occur.

Hedges of a Net Investment in a Foreign Operation

142. **Hedges of a net investment in a foreign operation, including a hedge of a monetary item that is accounted for as part of the net investment (see IPSAS 4), shall be accounted for similarly to cash flow hedges:**

(a) **The portion of the gain or loss on the hedging instrument that is determined to be an effective hedge shall be recognized in net assets/equity (see paragraph 140); and**

(b) **The ineffective portion shall be recognized in surplus or deficit.**

143. **The cumulative gain or loss on the hedging instrument relating to the effective portion of the hedge that has been accumulated in the foreign currency translation reserve shall be reclassified from net assets/equity to surplus or deficit as a reclassification adjustment (see IPSAS 1) in accordance with paragraphs 57–58 of IPSAS 4 on the disposal or partial disposal of the foreign operation.**

Accounting for the Time Value of Options

144. When an entity separates the intrinsic value and time value of an option contract and designates as the hedging instrument only the change in intrinsic value of the option (see paragraph 119(a)), it shall account for the time value of the option as follows (see paragraphs AG322–AG326):

(a) An entity shall distinguish the time value of options by the type of hedged item that the option hedges (see paragraph AG322):

(i) A transaction related hedged item; or

(ii) A time-period related hedged item.

(b) The change in fair value of the time value of an option that hedges a transaction related hedged item shall be recognized in net assets/equity to the extent that it relates to the hedged item and shall be accumulated in a separate component of net assets/equity. The cumulative change in fair value arising from the time value of the option that has been accumulated in a separate component of net assets/equity (the ‘amount’) shall be accounted for as follows:

(i) If the hedged item subsequently results in the recognition of a non-financial asset or a non-financial liability, or a firm commitment for a non-financial asset or a non-financial liability for which fair value hedge accounting is applied, the entity shall remove the amount from the separate component of net assets/equity and include it directly in the initial cost or other carrying amount of the asset or the liability. This is not a reclassification adjustment (see IPSAS 1) and hence does not affect net assets/equity.

(ii) For hedging relationships other than those covered by (i), the amount shall be reclassified from the separate component of net assets/equity to surplus or deficit as a reclassification adjustment (see IPSAS 1) in the same period or periods during which the hedged expected future cash flows affect surplus or deficit (for example, when a forecast sale occurs).

(iii) However, if all or a portion of that amount is not expected to be recovered in one or more future periods, the amount that is not expected to be recovered shall be immediately reclassified into surplus or deficit as a reclassification adjustment (see IPSAS 1).

(c) The change in fair value of the time value of an option that hedges a time-period related hedged item shall be recognized in net assets/equity to the extent that it relates to the hedged item and shall be accumulated in a separate component of net assets/equity. The time value at the date of designation of the option as a hedging instrument, to the extent that it relates to the hedged item, shall be amortized on a systematic and rational basis over the period during which the hedge adjustment for the option’s

intrinsic value could affect surplus or deficit (or net assets/equity, if the hedged item is an equity instrument for which an entity has elected to present changes in fair value in net assets/equity in accordance with paragraph 106). Hence, in each reporting period, the amortization amount shall be reclassified from the separate component of net assets/equity to surplus or deficit as a reclassification adjustment (see IPSAS 1). However, if hedge accounting is discontinued for the hedging relationship that includes the change in intrinsic value of the option as the hedging instrument, the net amount (i.e., including cumulative amortization) that has been accumulated in the separate component of net assets/equity shall be immediately reclassified into surplus or deficit as a reclassification adjustment (see IPSAS 1).

Accounting for the Forward Element of Forward Contracts and Foreign Currency Basis Spreads of Financial Instruments

145. When an entity separates the forward element and the spot element of a forward contract and designates as the hedging instrument only the change in the value of the spot element of the forward contract, or when an entity separates the foreign currency basis spread from a financial instrument and excludes it from the designation of that financial instrument as the hedging instrument (see paragraph 119(b)), the entity may apply paragraph 144 to the forward element of the forward contract or to the foreign currency basis spread in the same manner as it is applied to the time value of an option. In that case, the entity shall apply the application guidance in paragraphs AG327–AG332.

Hedges of a Group of Items

Eligibility of a Group of Items as the Hedged Item

146. **A group of items (including a group of items that constitute a net position; see paragraphs AG333–AG340) is an eligible hedged item only if:**

(a) **It consists of items (including components of items) that are, individually, eligible hedged items;**

(b) **The items in the group are managed together on a group basis for risk management purposes; and**

(c) **In the case of a cash flow hedge of a group of items whose variabilities in cash flows are not expected to be approximately proportional to the overall variability in cash flows of the group so that offsetting risk positions arise:**

(i) **It is a hedge of foreign currency risk; and**

(ii) **The designation of that net position specifies the reporting period in which the forecast transactions are expected to affect surplus or deficit, as well as their nature and volume (see paragraphs AG339–AG340).**

Designation of a Component of a Nominal Amount

147. A component that is a proportion of an eligible group of items is an eligible hedged item provided that designation is consistent with the entity's risk management objective.

148. A layer component of an overall group of items (for example, a bottom layer) is eligible for hedge accounting only if:

(a) It is separately identifiable and reliably measurable;

(b) The risk management objective is to hedge a layer component;

(c) The items in the overall group from which the layer is identified are exposed to the same hedged risk (so that the measurement of the hedged layer is not significantly affected by which particular items from the overall group form part of the hedged layer);

(d) For a hedge of existing items (for example, an unrecognized firm commitment or a recognized asset) an entity can identify and track the overall group of items from which the hedged layer is defined (so that the entity is able to comply with the requirements for the accounting for qualifying hedging relationships); and

(e) Any items in the group that contain prepayment options meet the requirements for components of a nominal amount (see paragraph AG269).

Presentation

149. For a hedge of a group of items with offsetting risk positions (i.e., in a hedge of a net position) whose hedged risk affects different line items in the statement of financial performance and statement of changes in net assets/equity, any hedging gains or losses in that statement shall be presented in a separate line from those affected by the hedged items. Hence, in that statement the amount in the line item that relates to the hedged item itself (for example, revenue or expenses) remains unaffected.

150. For assets and liabilities that are hedged together as a group in a fair value hedge, the gain or loss in the statement of financial position on the individual assets and liabilities shall be recognized as an adjustment of the carrying amount of the respective individual items comprising the group in accordance with paragraph 137(b).

Nil Net Positions

151. When the hedged item is a group that is a nil net position (i.e., the hedged items among themselves fully offset the risk that is managed on a group basis), an entity is permitted to designate it in a hedging relationship that does not include a hedging instrument, provided that:

(a) The hedge is part of a rolling net risk hedging strategy, whereby the entity routinely hedges new positions of the same type as time moves on (for example, when transactions move into the time horizon for which the entity hedges);

(b) The hedged net position changes in size over the life of the rolling net risk hedging strategy and the entity uses eligible hedging instruments to hedge the net risk (i.e., when the net position is not nil);

(c) Hedge accounting is normally applied to such net positions when the net position is not nil and it is hedged with eligible hedging instruments; and

(d) Not applying hedge accounting to the nil net position would give rise to inconsistent accounting outcomes, because the accounting would not recognize the offsetting risk positions that would otherwise be recognized in a hedge of a net position.

Option to Designate a Credit Exposure as Measured at Fair Value through Surplus or Deficit

Eligibility of Credit Exposures for Designation at Fair Value through Surplus or Deficit

152. **If an entity uses a credit derivative that is measured at fair value through surplus or deficit to manage the credit risk of all, or a part of, a financial instrument (credit exposure) it may designate that financial instrument to the extent that it is so managed (i.e., all or a proportion of it) as measured at fair value through surplus or deficit if:**

(a) **The name of the credit exposure (for example, the borrower, or the holder of a loan commitment) matches the reference entity of the credit derivative ('name matching'); and**

(b) **The seniority of the financial instrument matches that of the instruments that can be delivered in accordance with the credit derivative.**

An entity may make this designation irrespective of whether the financial instrument that is managed for credit risk is within the scope of this Standard (for example, an entity may designate loan commitments that are outside the scope of this Standard). The entity may designate that financial instrument at, or subsequent to, initial recognition, or while it is unrecognized. The entity shall document the designation concurrently.

Accounting for Credit Exposures Designated at Fair Value through Surplus or Deficit

153. If a financial instrument is designated in accordance with paragraph 152 as measured at fair value through surplus or deficit after its initial recognition, or was previously not recognized, the difference at the time of designation between the carrying amount, if any, and the fair value shall immediately be recognized in surplus or deficit. For financial assets measured at fair value through net assets/equity in accordance with paragraph 41, the cumulative gain or loss previously recognized in net assets/equity shall immediately be reclassified from net assets/equity to surplus or deficit as a reclassification adjustment (see IPSAS 1).

154. An entity shall discontinue measuring the financial instrument that gave rise to the credit risk, or a proportion of that financial instrument, at fair value through surplus or deficit if:

(a) The qualifying criteria in paragraph 152 are no longer met, for example:

(i) The credit derivative or the related financial instrument that gives rise to the credit risk expires or is sold, terminated or settled; or

(ii) The credit risk of the financial instrument is no longer managed using credit derivatives. For example, this could occur because of improvements in the credit quality of the borrower or the loan commitment holder or changes to capital requirements imposed on an entity; and

(b) The financial instrument that gives rise to the credit risk is not otherwise required to be measured at fair value through surplus or deficit (i.e., the entity's management model has not changed in the meantime so that a reclassification in accordance with paragraph 54 was required).

155. When an entity discontinues measuring the financial instrument that gives rise to the credit risk, or a proportion of that financial instrument, at fair value through surplus or deficit, that financial instrument's fair value at the date of discontinuation becomes its new carrying amount. Subsequently, the same measurement that was used before designating the financial instrument at fair value through surplus or deficit shall be applied (including amortization that results from the new carrying amount). For example, a financial asset that had originally been classified as measured at amortized cost would revert to that measurement and its effective interest rate would be recalculated based on its new gross carrying amount on the date of discontinuing measurement at fair value through surplus or deficit.

Temporary Exceptions from Applying Specific Hedge Accounting Requirements

155A. An entity shall apply paragraphs 155D–155L and paragraphs 156E and 184(d) to all hedging relationships directly affected by interest rate benchmark reform. These paragraphs apply only to such hedging relationships. A hedging relationship is directly affected by interest rate benchmark reform only if the reform gives rise to uncertainties about:

(a) The interest rate benchmark (contractually or non-contractually specified) designated as a hedged risk; and/or

(b) The timing or the amount of interest rate benchmark-based cash flows of the hedged item or of the hedging instrument.

155B. For the purpose of applying paragraphs 155D–155L, the term ‘interest rate benchmark reform’ refers to the market-wide reform of an interest rate benchmark, including the replacement of an interest rate benchmark with an alternative benchmark rate such as that resulting from the recommendations set out in the Financial Stability Board’s July 2014 report, ‘Reforming Major Interest Rate Benchmarks’.[3]

155C. Paragraphs 155D–155L provide exceptions only to the requirements specified in these paragraphs. An entity shall continue to apply all other hedge accounting requirements to hedging relationships directly affected by interest rate benchmark reform.

Highly Probable Requirement for Cash Flow Hedges

155D. For the purpose of determining whether a forecast transaction (or a component thereof) is highly probable as required by paragraph 124, an entity shall assume that the interest rate benchmark on which the hedged cash flows (contractually or non-contractually specified) are based is not altered as a result of interest rate benchmark reform.

Reclassifying the Amount Accumulated in the Cash Flow Hedge Reserve

155E. For the purpose of applying the requirement in paragraph 141 in order to determine whether the hedged future cash flows are expected to occur, an entity shall assume that the interest rate benchmark on which the hedged cash flows (contractually or non-contractually specified) are based is not altered as a result of interest rate benchmark reform.

Assessing the Economic Relationship between the Hedged Item and the Hedging Instrument

155F. For the purpose of applying the requirements in paragraphs 129(c)(i) and AG278–AG280, an entity shall assume that the interest rate benchmark on which the hedged cash flows and/or the hedged risk (contractually or non-contractually specified) are based, or the interest rate benchmark on which the cash flows of the hedging instrument are based, is not altered as a result of interest rate benchmark reform.

Designating a Component of an Item as a Hedged Item

155G. Unless paragraph 155H applies, for a hedge of a non-contractually specified benchmark component of interest rate risk, an entity shall apply the requirement in paragraphs 128(a) and AG257—that the risk component shall be separately identifiable—only at the inception of the hedging relationship.

155H. When an entity, consistent with its hedge documentation, frequently resets (i.e., discontinues and restarts) a hedging relationship because both the hedging instrument and the hedged item frequently change (i.e., the entity uses a dynamic process in which both the hedged items and the hedging instruments used to manage that exposure do not remain the same for long), the entity shall apply the requirement in paragraphs 128(a) and AG257—that the risk component is separately identifiable—only when it initially designates a hedged item in that hedging relationship. A hedged item that has been assessed at the time of its initial designation in the hedging relationship, whether it was at the time of the hedge inception or subsequently, is not reassessed at any subsequent redesignation in the same hedging relationship.

End of Application

155I. An entity shall prospectively cease applying paragraph 155D to a hedged item at the earlier of:

(a) When the uncertainty arising from interest rate benchmark reform is no longer present with respect to the timing and the amount of the interest rate benchmark-based cash flows of the hedged item; and

(b) When the hedging relationship that the hedged item is part of is discontinued.

[3] The report, ‘Reforming Major Interest Rate Benchmarks’, is available at http://www.fsb.org/wp-content/uploads/r_140722.pdf.

155J. An entity shall prospectively cease applying paragraph 155E at the earlier of:

(a) When the uncertainty arising from interest rate benchmark reform is no longer present with respect to the timing and the amount of the interest rate benchmark-based future cash flows of the hedged item; and

(b) When the entire amount accumulated in the cash flow hedge reserve with respect to that discontinued hedging relationship has been reclassified to surplus or deficit.

155K. An entity shall prospectively cease applying paragraph 155F:

(a) To a hedged item, when the uncertainty arising from interest rate benchmark reform is no longer present with respect to the hedged risk or the timing and the amount of the interest rate benchmark-based cash flows of the hedged item; and

(b) To a hedging instrument, when the uncertainty arising from interest rate benchmark reform is no longer present with respect to the timing and the amount of the interest rate benchmark-based cash flows of the hedging instrument.

If the hedging relationship that the hedged item and the hedging instrument are part of is discontinued earlier than the date specified in paragraph 155K(a) or the date specified in paragraph 155K(b), the entity shall prospectively cease applying paragraph 155F to that hedging relationship at the date of discontinuation.

155L. When designating a group of items as the hedged item, or a combination of financial instruments as the hedging instrument, an entity shall prospectively cease applying paragraphs 155D–155F to an individual item or financial instrument in accordance with paragraphs 155I, 155J, or 155K, as relevant, when the uncertainty arising from interest rate benchmark reform is no longer present with respect to the hedged risk and/or the timing and the amount of the interest rate benchmark-based cash flows of that item or financial instrument.

155M. An entity shall prospectively cease applying paragraphs 155G and 155H at the earlier of:

(a) When changes required by interest rate benchmark reform are made to the non-contractually specified risk component applying paragraph 155N; or

(b) When the hedging relationship in which the non-contractually specified risk component is designated is discontinued.

Additional Temporary Exceptions Arising from Interest Rate Benchmark Reform

155N. As and when the requirements in paragraphs 155D–155H cease to apply to a hedging relationship (see paragraphs 155I–155M), an entity shall amend the formal designation of that hedging relationship as previously documented to reflect the changes required by interest rate benchmark reform, i.e., the changes are consistent with the requirements in paragraphs 72B–72D. In this context, the hedge designation shall be amended only to make one or more of these changes:

(a) Designating an alternative benchmark rate (contractually or non-contractually specified) as a hedged risk;

(b) Amending the description of the hedged item, including the description of the designated portion of the cash flows or fair value being hedged; or

(c) Amending the description of the hedging instrument.

155O. An entity also shall apply the requirement in paragraph 155N(c) if these three conditions are met:

(a) The entity makes a change required by interest rate benchmark reform using an approach other than changing the basis for determining the contractual cash flows of the hedging instrument (as described in paragraph 72B);

(b) The original hedging instrument is not derecognized; and

(c) The chosen approach is economically equivalent to changing the basis for determining the contractual cash flows of the original hedging instrument (as described in paragraphs 72C and 72D).

155P. The requirements in paragraphs 155D–155H may cease to apply at different times. Therefore, in applying paragraph 155N, an entity may be required to amend the formal designation of its hedging relationships at different times, or may be required to amend the formal designation of a hedging relationship more than once. When, and only when, such a change is made to the hedge designation, an entity shall apply paragraphs 155T–155Y as applicable. An entity also shall apply paragraph 137 (for a fair value hedge) or paragraph 140 (for a cash flow hedge) to account for any changes in the fair value of the hedged item or the hedging instrument.

155Q. An entity shall amend a hedging relationship as required in paragraph 155N by the end of the reporting period during which a change required by interest rate benchmark reform is made to the hedged risk, hedged item or hedging instrument. For the avoidance of doubt, such an amendment to the formal designation of a hedging relationship constitutes neither the discontinuation of the hedging relationship nor the designation of a new hedging relationship.

155R. If changes are made in addition to those changes required by interest rate benchmark reform to the financial asset or financial liability designated in a hedging relationship (as described in paragraphs 72B–72D) or to the designation of the hedging relationship (as required by paragraph 155N), an entity shall first apply the applicable requirements in this Standard to determine if those additional changes result in the discontinuation of hedge accounting. If the additional changes do not result in the discontinuation of hedge accounting, an entity shall amend the formal designation of the hedging relationship as specified in paragraph 155N.

155S. Paragraphs 155T–155Z provide exceptions to the requirements specified in those paragraphs only. An entity shall apply all other hedge accounting requirements in this Standard, including the qualifying criteria in paragraph 129, to hedging relationships that were directly affected by interest rate benchmark reform.

Accounting for Qualifying Hedging Relationships

Cash Flow Hedges

155T. For the purpose of applying paragraph 140, at the point when an entity amends the description of a hedged item as required in paragraph 155N(b), the amount accumulated in the cash flow hedge reserve shall be deemed to be based on the alternative benchmark rate on which the hedged future cash flows are determined.

155U. For a discontinued hedging relationship, when the interest rate benchmark on which the hedged future cash flows had been based is changed as required by interest rate benchmark reform, for the purpose of applying paragraph 141 in order to determine whether the hedged future cash flows are expected to occur, the amount accumulated in the cash flow hedge reserve for that hedging relationship shall be deemed to be based on the alternative benchmark rate on which the hedged future cash flows will be based.

Groups of Items

155V. When an entity applies paragraph 155N to groups of items designated as hedged items in a fair value or cash flow hedge, the entity shall allocate the hedged items to subgroups based on the benchmark rate being hedged and designate the benchmark rate as the hedged risk for each subgroup. For example, in a hedging relationship in which a group of items is hedged for changes in an interest rate benchmark subject to interest rate benchmark reform, the hedged cash flows or fair value of some items in the group could be changed to reference an alternative benchmark rate before other items in the group are changed. In this example, in applying paragraph 155N, the entity would designate the alternative benchmark rate as the hedged risk for

that relevant subgroup of hedged items. The entity would continue to designate the existing interest rate benchmark as the hedged risk for the other subgroup of hedged items until the hedged cash flows or fair value of those items are changed to reference the alternative benchmark rate or the items expire and are replaced with hedged items that reference the alternative benchmark rate.

155W. An entity shall assess separately whether each subgroup meets the requirements in paragraph 146 to be an eligible hedged item. If any subgroup fails to meet the requirements in paragraph 146, the entity shall discontinue hedge accounting prospectively for the hedging relationship in its entirety. An entity also shall apply the requirements in paragraphs 137 and 140 to account for ineffectiveness related to the hedging relationship in its entirety.

Designation of Risk Components

155X. An alternative benchmark rate designated as a non-contractually specified risk component that is not separately identifiable (see paragraphs 128(a) and AG257) at the date it is designated shall be deemed to have met that requirement at that date, if, and only if, the entity reasonably expects the alternative benchmark rate will be separately identifiable within 24 months. The 24-month period applies to each alternative benchmark rate separately and starts from the date the entity designates the alternative benchmark rate as a non-contractually specified risk component for the first time (ie the 24-month period applies on a rate-by-rate basis).

155Y. If subsequently an entity reasonably expects that the alternative benchmark rate will not be separately identifiable within 24 months from the date the entity designated it as a non-contractually specified risk component for the first time, the entity shall cease applying the requirement in paragraph 155X to that alternative benchmark rate and discontinue hedge accounting prospectively from the date of that reassessment for all hedging relationships in which the alternative benchmark rate was designated as a non-contractually specified risk component.

155Z. In addition to those hedging relationships specified in paragraph 155N, an entity shall apply the requirements in paragraphs 155X and 155Y to new hedging relationships in which an alternative benchmark rate is designated as a non-contractually specified risk component (see paragraphs 128(a) and AG257) when, because of interest rate benchmark reform, that risk component is not separately identifiable at the date it is designated.

Effective Date and Transition

Effective Date

156. **An entity shall apply this Standard for annual financial statements covering periods beginning on or after January 1, 2023. Earlier application is permitted. If an entity elects to apply this Standard early, it must disclose that fact and apply all of the requirements in this Standard at the same time (but see also paragraph 179). It shall also, at the same time, apply the amendments in Appendix D.**

156A. ***Long-term Interests in Associates and Joint Ventures*** **(Amendments to IPSAS 36) and** ***Prepayment Features with Negative Compensation*** **(Amendments to IPSAS 41), issued in January 2019, added paragraphs 185–190 and AG74A and amended paragraphs AG73(b) and AG74(b). An entity shall apply these amendments for annual periods beginning on or after January 1, 2023. Earlier application is permitted. If an entity applies these amendments for an earlier period, it shall disclose that fact.**

156B. **Paragraphs 155A–155L were added and paragraph 184 was amended by** ***Improvements to IPSAS, 2021*****, issued in January 2022. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2023. Earlier application is permitted. If an entity applies these amendments for an earlier period, it shall disclose that fact.**

156C. **Paragraphs 72A–72E, 155M–155Z, and 191-194 were added by *Improvements to IPSAS, 2021*, issued in January 2022. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2023. Earlier application is permitted. If an entity applies these amendments for an earlier period, it shall disclose that fact.**

156D. **Paragraph AG46 was amended and paragraphs AG46A and 195 were added by *Improvements to IPSAS, 2021*, issued in January 2022. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2023. Earlier application is permitted. If an entity applies these amendments for an earlier period, it shall disclose that fact.**

156E. **Paragraphs 2, 87, AG198 and AG210 were amended by IPSAS 43 issued in January 2022. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2025. Earlier application is permitted. If an entity applies the amendments for a period beginning before January 1, 2025, it shall disclose that fact and apply IPSAS 43 at the same time.**

156F. **Paragraphs 9, 66, AG31, AG38, AG115 and AG117 were amended, paragraphs AG143A–AG143AB were added, and paragraphs 67, 68 and AG144–AG155 were deleted by IPSAS 46, *Measurement* issued in May 2023. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2025. Earlier application is encouraged. If an entity applies the amendment for a period beginning before January 1, 2025, it shall disclose that fact and apply IPSAS 46 at the same time.**

156G. **Paragraphs 2, 3, 37, 45, 60, 87 and its related heading, AG2, AG5, AG6, AG33, AG34, AG43, AG44, AG114 and its related heading, AG124, AG125, AG129, AG132, AG133, and AG158 were amended by IPSAS 47, issued in May 2023. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2026. Earlier application is encouraged. If an entity applies the amendments for a period beginning before January 1, 2026, it shall disclose that fact and apply IPSAS 47 at the same time.**

156H. **Paragraph AG2 was amended by IPSAS 49, *Retirement Benefit* Plans issued in November 2023. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2026. Earlier application is permitted. If an entity applies the amendment for a period beginning before January 1, 2026, it shall disclose that fact.**

156I. **Paragraphs AG124, AG130, AG135, and AG136 are amended by Part 3 *Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement*, issued in August 2025. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2028. Earlier application is permitted.**

157. When an entity adopts accrual basis IPSAS Standards as defined in IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards* for financial reporting purposes subsequent to this effective date, this Standard applies to the entity's annual financial statements covering periods beginning on or after the date of adoption of IPSAS Standards.

Transition

158. An entity shall apply this Standard retrospectively, in accordance with IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*, except as specified in paragraphs 161–184. This Standard shall not be applied to items that have already been derecognized at the date of initial application.

159. For the purposes of the transition provisions in paragraphs 158, 160–184, the date of initial application is the date when an entity first applies those requirements of this Standard and must be the beginning of a reporting period after the issue of this Standard.

Transition for Classification and Measurement

160. At the date of initial application, an entity shall assess whether a financial asset meets the condition in paragraphs 40(a) or 41(a) on the basis of the facts and circumstances that exist at that date. The resulting classification shall be applied retrospectively irrespective of the entity's management model in prior reporting periods.

161. If, at the date of initial application, it is impracticable (as defined in IPSAS 3) for an entity to assess a modified time value of money element in accordance with paragraphs AG68–AG70 on the basis of the facts and circumstances that existed at the initial recognition of the financial asset, an entity shall assess the contractual cash flow characteristics of that financial asset on the basis of the facts and circumstances that existed at the initial recognition of the financial asset without taking into account the requirements related to the modification of the time value of money element in paragraphs AG68–AG70. (See also paragraph 49R of IPSAS 30.)

162. If, at the date of initial application, it is impracticable (as defined in IPSAS 3) for an entity to assess whether the fair value of a prepayment feature was insignificant in accordance with paragraph AG74(c) on the basis of the facts and circumstances that existed at the initial recognition of the financial asset, an entity shall assess the contractual cash flow characteristics of that financial asset on the basis of the facts and circumstances that existed at the initial recognition of the financial asset without taking into account the exception for prepayment features in paragraph AG74. (See also paragraph 49S of IPSAS 30.)

163. If an entity measures a hybrid contract at fair value in accordance with paragraphs 41, 43 or 44 but the fair value of the hybrid contract had not been measured in comparative reporting periods, the fair value of the hybrid contract in the comparative reporting periods shall be the sum of the fair values of the components (i.e., the non-derivative host and the embedded derivative) at the end of each comparative reporting period if the entity restates prior periods (see paragraph 173).

164. If an entity has applied paragraph 163 then at the date of initial application the entity shall recognize any difference between the fair value of the entire hybrid contract at the date of initial application and the sum of the fair values of the components of the hybrid contract at the date of initial application in the opening accumulated surplus or deficit (or other component of net assets/equity, as appropriate) of the reporting period that includes the date of initial application.

165. At the date of initial application an entity may designate:

(a) A financial asset as measured at fair value through surplus or deficit in accordance with paragraph 44; or

(b) An investment in an equity instrument as at fair value through net assets/equity in accordance with paragraph 106.

Such a designation shall be made on the basis of the facts and circumstances that exist at the date of initial application. That classification shall be applied retrospectively.

166. At the date of initial application an entity:

(a) Shall revoke its previous designation of a financial asset as measured at fair value through surplus or deficit if that financial asset does not meet the condition in paragraph 44.

(b) May revoke its previous designation of a financial asset as measured at fair value through surplus or deficit if that financial asset meets the condition in paragraph 44.

Such a revocation shall be made on the basis of the facts and circumstances that exist at the date of initial application. That classification shall be applied retrospectively.

167. At the date of initial application, an entity:

(a) May designate a financial liability as measured at fair value through surplus or deficit in accordance with paragraph 46(a).

(b) Shall revoke its previous designation of a financial liability as measured at fair value through surplus or deficit if such designation was made at initial recognition in accordance with the condition now in paragraph 46(a) and such designation does not satisfy that condition at the date of initial application.

(c) May revoke its previous designation of a financial liability as measured at fair value through surplus or deficit if such designation was made at initial recognition in accordance with the condition now in paragraph 46(a) and such designation satisfies that condition at the date of initial application.

Such a designation and revocation shall be made on the basis of the facts and circumstances that exist at the date of initial application. That classification shall be applied retrospectively.

168. If it is impracticable (as defined in IPSAS 3) for an entity to apply retrospectively the effective interest method, the entity shall treat:

(a) The fair value of the financial asset or the financial liability at the end of each comparative period presented as the gross carrying amount of that financial asset or the amortized cost of that financial liability if the entity restates prior periods; and

(b) The fair value of the financial asset or the financial liability at the date of initial application as the new gross carrying amount of that financial asset or the new amortized cost of that financial liability at the date of initial application of this Standard.

169. If an entity previously accounted at cost (in accordance with IPSAS 29), for an investment in an equity instrument that does not have a quoted price in an active market for an identical instrument (i.e., a Level 1 input) (or for a derivative asset that is linked to and must be settled by delivery of such an equity instrument) it shall measure that instrument at fair value at the date of initial application. Any difference between the previous carrying amount and the fair value shall be recognized in the opening accumulated surplus or deficit (or other component of net assets/equity, as appropriate) of the reporting period that includes the date of initial application.

170. If an entity previously accounted for a derivative liability that is linked to, and must be settled by, delivery of an equity instrument that does not have a quoted price in an active market for an identical instrument (i.e., a Level 1 input) at cost in accordance with IPSAS 29, it shall measure that derivative liability at fair value at the date of initial application. Any difference between the previous carrying amount and the fair value shall be recognized in the opening net assets/equity of the reporting period that includes the date of initial application.

171. At the date of initial application, an entity shall determine whether the treatment in paragraph 108 would create or enlarge an accounting mismatch in surplus or deficit on the basis of the facts and circumstances that exist at the date of initial application. This Standard shall be applied retrospectively on the basis of that determination.

172. At the date of initial application, an entity is permitted to make the designation in paragraph 6 for contracts that already exist on the date but only if it designates all similar contracts. The change in the net assets resulting from such designations shall be recognized in net assets/equity at the date of initial application.

173. Despite the requirement in paragraph 158, an entity that adopts the classification and measurement requirements of this Standard (which include the requirements related to amortized cost measurement for financial assets and impairment in paragraphs 69–72 and paragraphs 73–93) shall provide the disclosures set out in paragraphs 49L–49O of IPSAS 30 but need not restate prior periods. The entity may restate prior periods if, and only if, it is possible without the use of hindsight. If an entity does not restate prior periods, the

entity shall recognize any difference between the previous carrying amount and the carrying amount at the beginning of the annual reporting period that includes the date of initial application in the opening accumulated surplus or deficit (or other component of net assets/equity, as appropriate) of the annual reporting period that includes the date of initial application. However, if an entity restates prior periods, the restated financial statements must reflect all of the requirements in this Standard.

174. If an entity prepares interim financial reports, the entity need not apply the requirements in this Standard to interim periods prior to the date of initial application if it is impracticable (as defined in IPSAS 3).

Impairment

175. An entity shall apply the impairment requirements in paragraphs 73–93 retrospectively in accordance with IPSAS 3 subject to paragraphs 173 and 176–178.

176. At the date of initial application, an entity shall use reasonable and supportable information that is available without undue cost or effort to determine the credit risk at the date that a financial instrument was initially recognized (or for loan commitments and financial guarantee contracts at the date that the entity became a party to the irrevocable commitment in accordance with paragraph 78) and compare that to the credit risk at the date of initial application of this Standard.

177. When determining whether there has been a significant increase in credit risk since initial recognition, an entity may apply:

(a) The requirements in paragraphs 82 and AG186–AG188; and

(b) The rebuttable presumption in paragraph 83 for contractual payments that are more than 30 days past due if an entity will apply the impairment requirements by identifying significant increases in credit risk since initial recognition for those financial instruments on the basis of past due information.

178. If, at the date of initial application, determining whether there has been a significant increase in credit risk since initial recognition would require undue cost or effort, an entity shall recognize a loss allowance at an amount equal to lifetime expected credit losses at each reporting date until that financial instrument is derecognized (unless that financial instrument is low credit risk at a reporting date, in which case paragraph 177(a) applies).

Transition for Hedge Accounting

179. When an entity first applies this Standard, it may choose as its accounting policy to continue to apply the hedge accounting requirements of IPSAS 29 instead of the requirements in paragraphs 113–155 of this Standard. An entity shall apply that policy to all of its hedging relationships. An entity that chooses that policy shall also apply Appendix C of IPSAS 29.

180. Except as provided in paragraph 184, an entity shall apply the hedge accounting requirements of this Standard prospectively.

181. To apply hedge accounting from the date of initial application of the hedge accounting requirements of this Standard, all qualifying criteria must be met as at that date.

182. Hedging relationships that qualified for hedge accounting in accordance with IPSAS 29 that also qualify for hedge accounting in accordance with the criteria of this Standard (see paragraph 129), after taking into account any rebalancing of the hedging relationship on transition (see paragraph 183(b))), shall be regarded as continuing hedging relationships.

183. On initial application of the hedge accounting requirements of this Standard, an entity:

(a) May start to apply those requirements from the same point in time as it ceases to apply the hedge accounting requirements of IPSAS 29; and

(b) Shall consider the hedge ratio in accordance with IPSAS 29 as the starting point for rebalancing the hedge ratio of a continuing hedging relationship, if applicable. Any gain or loss from such a rebalancing shall be recognized in surplus or deficit.

184. As an exception to prospective application of the hedge accounting requirements of this Standard, an entity:

(a) Shall apply the accounting for the time value of options in accordance with paragraph 144 retrospectively if, in accordance with IPSAS 29, only the change in an option's intrinsic value was designated as a hedging instrument in a hedging relationship. This retrospective application applies only to those hedging relationships that existed at the beginning of the earliest comparative period or were designated thereafter.

(b) May apply the accounting for the forward element of forward contracts in accordance with paragraph 145 retrospectively if, in accordance with IPSAS 29, only the change in the spot element of a forward contract was designated as a hedging instrument in a hedging relationship. This retrospective application applies only to those hedging relationships that existed at the beginning of the earliest comparative period or were designated thereafter. In addition, if an entity elects retrospective application of this accounting, it shall be applied to all hedging relationships that qualify for this election (i.e., on transition this election is not available on a hedging-relationship-by-hedging-relationship basis). The accounting for foreign currency basis spreads (see paragraph 145) may be applied retrospectively for those hedging relationships that existed at the beginning of the earliest comparative period or were designated thereafter.

(c) Shall apply retrospectively the requirement of paragraph 135 that there is not an expiration or termination of the hedging instrument if:

(i) As a consequence of laws or regulations, or the introduction of laws or regulations, the parties to the hedging instrument agree that one or more clearing counterparties replace their original counterparty to become the new counterparty to each of the parties; and

(ii) Other changes, if any, to the hedging instrument are limited to those that are necessary to effect such a replacement of the counterparty.

(d) Shall apply the requirements in paragraphs 155A–155L retrospectively. This retrospective application applies only to those hedging relationships that existed at the beginning of the reporting period in which an entity first applies those requirements or were designated thereafter, and to the amount accumulated in the cash flow hedge reserve that existed at the beginning of the reporting period in which an entity first applies those requirements.

Transition for Prepayment Features with Negative Compensation

185. **An entity shall apply *Long-term Interests in Associates and Joint Ventures* (Amendments to IPSAS 36) and *Prepayment Features with Negative Compensation* (Amendments to IPSAS 41) retrospectively in accordance with IPSAS 3, except as specified in paragraphs 186–190.**

186. **An entity that first applies these amendments at the same time it first applies this Standard shall apply paragraphs 157–183 instead of paragraphs 187–190.**

187. **An entity that first applies these amendments after it first applies this Standard shall apply paragraphs 188–190. The entity shall also apply the other transition requirements in this Standard necessary for applying these amendments. For that purpose, references to the date of initial application shall be read as referring to the beginning of the reporting period in which an entity first applies these amendments (date of initial application of these amendments).**

188. **With regard to designating a financial asset or financial liability as measured at fair value through surplus or deficit, an entity:**

(a) **Shall revoke its previous designation of a financial asset as measured at fair value through surplus or deficit if that designation was previously made in accordance with the condition in paragraph 44 but that condition is no longer satisfied as a result of the application of these amendments;**

(b) **May designate a financial asset as measured at fair value through surplus or deficit if that designation would not have previously satisfied the condition in paragraph 44 but that condition is now satisfied as a result of the application of these amendments;**

(c) **Shall revoke its previous designation of a financial liability as measured at fair value through surplus or deficit if that designation was previously made in accordance with the condition in paragraph 46(a) but that condition is no longer satisfied as a result of the application of these amendments; and**

(d) **May designate a financial liability as measured at fair value through surplus or deficit if that designation would not have previously satisfied the condition in paragraph 46(a) but that condition is now satisfied as a result of the application of these amendments.**

Such a designation and revocation shall be made on the basis of the facts and circumstances that exist at the date of initial application of these amendments. That classification shall be applied retrospectively.

189. **An entity is not required to restate prior periods to reflect the application of these amendments. The entity may restate prior periods if, and only if, it is possible without the use of hindsight and the restated financial statements reflect all the requirements in this Standard. If an entity does not restate prior periods, the entity shall recognize any difference between the previous carrying amount and the carrying amount at the beginning of the annual reporting period that includes the date of initial application of these amendments in the opening accumulated surplus or deficit (or other component of net assets/equity, as appropriate) of the annual reporting period that includes the date of initial application of these amendments.**

190. **In the reporting period that includes the date of initial application of these amendments, the entity shall disclose the following information as at that date of initial application for each class of financial assets and financial liabilities that were affected by these amendments:**

(a) **The previous measurement category and carrying amount determined immediately before applying these amendments;**

(b) **The new measurement category and carrying amount determined after applying these amendments;**

(c) **The carrying amount of any financial assets and financial liabilities in the statement of financial position that were previously designated as measured at fair value through surplus or deficit but are no longer so designated; and**

(d) **The reasons for any designation or de-designation of financial assets or financial liabilities as measured at fair value through surplus or deficit.**

Transition for Interest Rate Benchmark Reform—Phase 2

191. An entity shall apply *Interest Rate Benchmark Reform—Phase 2* amendments retrospectively in accordance with IPSAS 3, except as specified in paragraphs 192–194.

192. An entity shall designate a new hedging relationship (for example, as described in paragraph 155Z) only prospectively (i.e., an entity is prohibited from designating a new hedge accounting relationship in prior periods). However, an entity shall reinstate a discontinued hedging relationship if, and only if, these conditions are met:

(a) The entity had discontinued that hedging relationship solely due to changes required by interest rate benchmark reform and the entity would not have been required to discontinue that hedging relationship if these amendments had been applied at that time; and

(b) At the beginning of the reporting period in which an entity first applies these amendments (date of initial application of these amendments), that discontinued hedging relationship meets the qualifying criteria for hedge accounting (after taking into account these amendments).

193. If, in applying paragraph 192, an entity reinstates a discontinued hedging relationship, the entity shall read references in paragraphs 155X and 155Y to the date the alternative benchmark rate is designated as a non-contractually specified risk component for the first time as referring to the date of initial application of these amendments (i.e., the 24-month period for that alternative benchmark rate designated as a non-contractually specified risk component begins from the date of initial application of these amendments).

194. An entity is not required to restate prior periods to reflect the application of these amendments. The entity may restate prior periods if, and only if, it is possible without the use of hindsight. If an entity does not restate prior periods, the entity shall recognize any difference between the previous carrying amount and the carrying amount at the beginning of the annual reporting period that includes the date of initial application of these amendments in the opening net assets/equity (or other component of net assets/equity, as appropriate) of the annual reporting period that includes the date of initial application of these amendments.

Transition for Improvements to IPSAS, 2021

195. An entity shall apply *Improvements to IPSAS, 2021* to financial liabilities that are modified or exchanged on or after the beginning of the annual reporting period in which the entity first applies the amendment.

Appendix A

Application Guidance

This Appendix is an integral part of IPSAS 41.

Scope

AG1. Some contracts require a payment based on climatic, geological or other physical variables. (Those based on climatic variables are sometimes referred to as 'weather derivatives'.) If those contracts are not insurance contracts, they are within the scope of this Standard.

AG2. This Standard does not change the requirements relating to employee benefit plans that comply with IPSAS 49, *Retirement Benefit Plans*, and royalty agreements based on the volume of sales or service revenues that are accounted for under IPSAS 47, Revenue.

AG3. Sometimes, an entity makes what it views as a 'strategic investment' in equity instruments issued by another entity, with the management model of establishing or maintaining a long-term operating relationship with the entity in which the investment is made. The investor or joint venturer entity uses IPSAS 36, *Investments in Associates and Joint Ventures* to determine whether the equity method of accounting shall be applied to such an investment.

AG4. This Standard applies to the financial assets and financial liabilities of insurers, other than rights and obligations that paragraph 2(e) excludes because they arise from insurance contracts. An entity does however apply this Standard to:

(a) Financial guarantee contracts, except those where the issuer elects to treat such contracts as insurance contracts in accordance with IPSAS 28; and

(b) Embedded derivatives included in insurance contracts.

An entity may, but is not required to, apply this Standard to other insurance contracts that involve the transfer of financial risk.

AG5. Financial guarantee contracts may have various legal forms, such as a guarantee, some types of letter of credit, a credit default contract or an insurance contract. Their accounting treatment does not depend on their legal form. The following are examples of the appropriate treatment (see paragraph 2(e)):

(a) Although a financial guarantee contract meets the definition of an insurance contract in the scope of the relevant international or national accounting standard dealing with insurance contracts if the risk transferred is significant, the issuer applies this Standard. Nevertheless, an entity may elect, under certain circumstances, to treat financial guarantee contracts as insurance contracts of financial instruments using IPSAS 28 if the issuer has previously adopted an accounting policy that treated financial guarantee contracts as insurance contracts and has used accounting applicable to insurance contracts, the issuer may elect to apply either this Standard or the relevant international or national accounting standard on insurance contracts to such financial guarantee contracts. If this Standard applies, paragraph 57 requires the issuer to recognize a financial guarantee contract initially at fair value. If the financial guarantee contract was issued to an unrelated party in a stand-alone arm's length transaction, its fair value at inception is likely to equal the premium received, unless there is evidence to the contrary. Subsequently, unless the financial guarantee contract was designated at inception as at fair value through surplus or deficit or unless paragraphs 26–34 and AG32–AG38 apply (when a transfer of a financial asset does not qualify for derecognition or the continuing involvement approach applies), the issuer measures it at the higher of:

(i) The amount determined in accordance with paragraphs 73–93; and

(ii) The amount initially recognized less, when appropriate, the cumulative amount of revenue recognized in accordance with the principles of IPSAS 47 (see paragraph 45(c)).

(b) Some credit-related guarantees do not, as a precondition for payment, require that the holder is exposed to, and has incurred a loss on, the failure of the debtor to make payments on the guaranteed asset when due. An example of such a guarantee is one that requires payments in response to changes in a specified credit rating or credit index. Such guarantees are not financial guarantee contracts as defined in this Standard, and are not insurance contracts. Such guarantees are derivatives and the issuer applies this Standard to them.

(c) If a financial guarantee contract was issued in connection with the provision of goods, the issuer applies IPSAS 47 in determining when it recognizes the revenue from the guarantee and from the provision of goods.

AG6. A right from a revenue transaction that meets the definition of an asset is initially recognized and measured in accordance with IPSAS 47. Similarly, an obligation from a revenue transaction that meets the definition of a liability is initially recognized and measured in accordance with IPSAS 47. After initial recognition, if circumstances indicate that recognition of a liability in accordance with IPSAS 47 is no longer appropriate, an entity considers whether a financial liability should be recognized in accordance with this Standard. Other liabilities that may arise from revenue transactions are recognized and measured in accordance with this Standard if they meet the definition of a financial liability in IPSAS 28.

Definitions

Derivatives

AG7. Typical examples of derivatives are futures and forward, swap and option contracts. A derivative usually has a notional amount, which is an amount of currency, a number of shares, a number of units of weight or volume or other units specified in the contract. However, a derivative instrument does not require the holder or writer to invest or receive the notional amount at the inception of the contract. Alternatively, a derivative could require a fixed payment or payment of an amount that can change (but not proportionally with a change in the underlying) as a result of some future event that is unrelated to a notional amount. For example, a contract may require a fixed payment of CU1,000 if the six-month interbank offered rate increases by 100 basis points. Such a contract is a derivative even though a notional amount is not specified.

AG8. The definition of a derivative in this Standard includes contracts that are settled gross by delivery of the underlying item (e.g., a forward contract to purchase a fixed rate debt instrument). An entity may have a contract to buy or sell a non-financial item that can be settled net in cash or another financial instrument or by exchanging financial instruments (e.g., a contract to buy or sell a commodity at a fixed price at a future date). Such a contract is within the scope of this Standard unless it was entered into and continues to be held for the purpose of delivery of a non-financial item in accordance with the entity's expected purchase, sale or usage requirements. However, this Standard applies to such contracts for an entity's expected purchase, sale or usage requirements if the entity makes a designation in accordance with paragraph 6 (see paragraphs 5–8).

AG9. One of the defining characteristics of a derivative is that it has an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors. An option contract meets that definition because the premium is less than the investment that would be required to obtain the underlying financial instrument to which the option is linked. A currency swap that requires an initial exchange of different currencies of equal fair values meets the definition because it has a zero initial net investment.

AG10. A regular way purchase or sale gives rise to a fixed price commitment between trade date and settlement date that meets the definition of a derivative. However, because of the short duration of the commitment it is not recognized as a derivative financial instrument. Instead, this Standard provides for special accounting for such regular way contracts (see paragraphs 11 and AG17–AG20).

AG11. The definition of a derivative refers to non-financial variables that are not specific to a party to the contract. These include an index of earthquake losses in a particular region and an index of temperatures in a particular city. Non-financial variables specific to a party to the contract include the occurrence or non-occurrence of a fire that damages or destroys an asset of a party to the contract. A change in the fair value of a non-financial asset is specific to the owner if the fair value reflects not only changes in market prices for such assets (a financial variable) but also the condition of the specific non-financial asset held (a non-financial variable). For example, if a guarantee of the residual value of a specific car exposes the guarantor to the risk of changes in the car's physical condition, the change in that residual value is specific to the owner of the car.

Financial Assets and Liabilities Held for Trading

AG12. Trading generally reflects active and frequent buying and selling, and financial instruments held for trading generally are used with the objective of generating a profit from short-term fluctuations in price or dealer's margin.

AG13. Financial liabilities held for trading include:

(a) Derivative liabilities that are not accounted for as hedging instruments;

(b) Obligations to deliver financial assets borrowed by a short seller (i.e., an entity that sells financial assets it has borrowed and does not yet own);

(c) Financial liabilities that are incurred with a management model to repurchase them in the near term (e.g., a quoted debt instrument that the issuer may buy back in the near term depending on changes in its fair value); and

(d) Financial liabilities that are part of a portfolio of identified financial instruments that are managed together and for which there is evidence of a recent pattern of short-term profit-taking.

AG14. The fact that a liability is used to fund trading activities does not in itself make that liability one that is held for trading.

Recognition and Derecognition

Initial Recognition

AG15. As a consequence of the principle in paragraph 10, an entity recognizes all of its contractual rights and obligations under derivatives in its statement of financial position as assets and liabilities, respectively, except for derivatives that prevent a transfer of financial assets from being accounted for as a sale (see paragraph AG35). If a transfer of a financial asset does not qualify for derecognition, the transferee does not recognize the transferred asset as its asset (see paragraph AG36).

AG16. The following are examples of applying the principle in paragraph 10:

(a) Unconditional receivables and payables are recognized as assets or liabilities when the entity becomes a party to the contract and, as a consequence, has a legal right to receive or a legal obligation to pay cash.

(b) Assets to be acquired and liabilities to be incurred as a result of a firm commitment to purchase or sell goods or services are generally not recognized until at least one of the parties has performed under the agreement. For example, an entity that receives a firm order does not generally recognize an asset

(and the entity that places the order does not recognize a liability) at the time of the commitment but, instead, delays recognition until the ordered goods or services have been shipped, delivered or rendered. If a firm commitment to buy or sell non-financial items is within the scope of this Standard in accordance with paragraphs 5–8, its net fair value is recognized as an asset or a liability on the commitment date (see paragraph AG92(c)). In addition, if a previously unrecognized firm commitment is designated as a hedged item in a fair value hedge, any change in the net fair value attributable to the hedged risk is recognized as an asset or a liability after the inception of the hedge (see paragraphs 137(b) and 138).

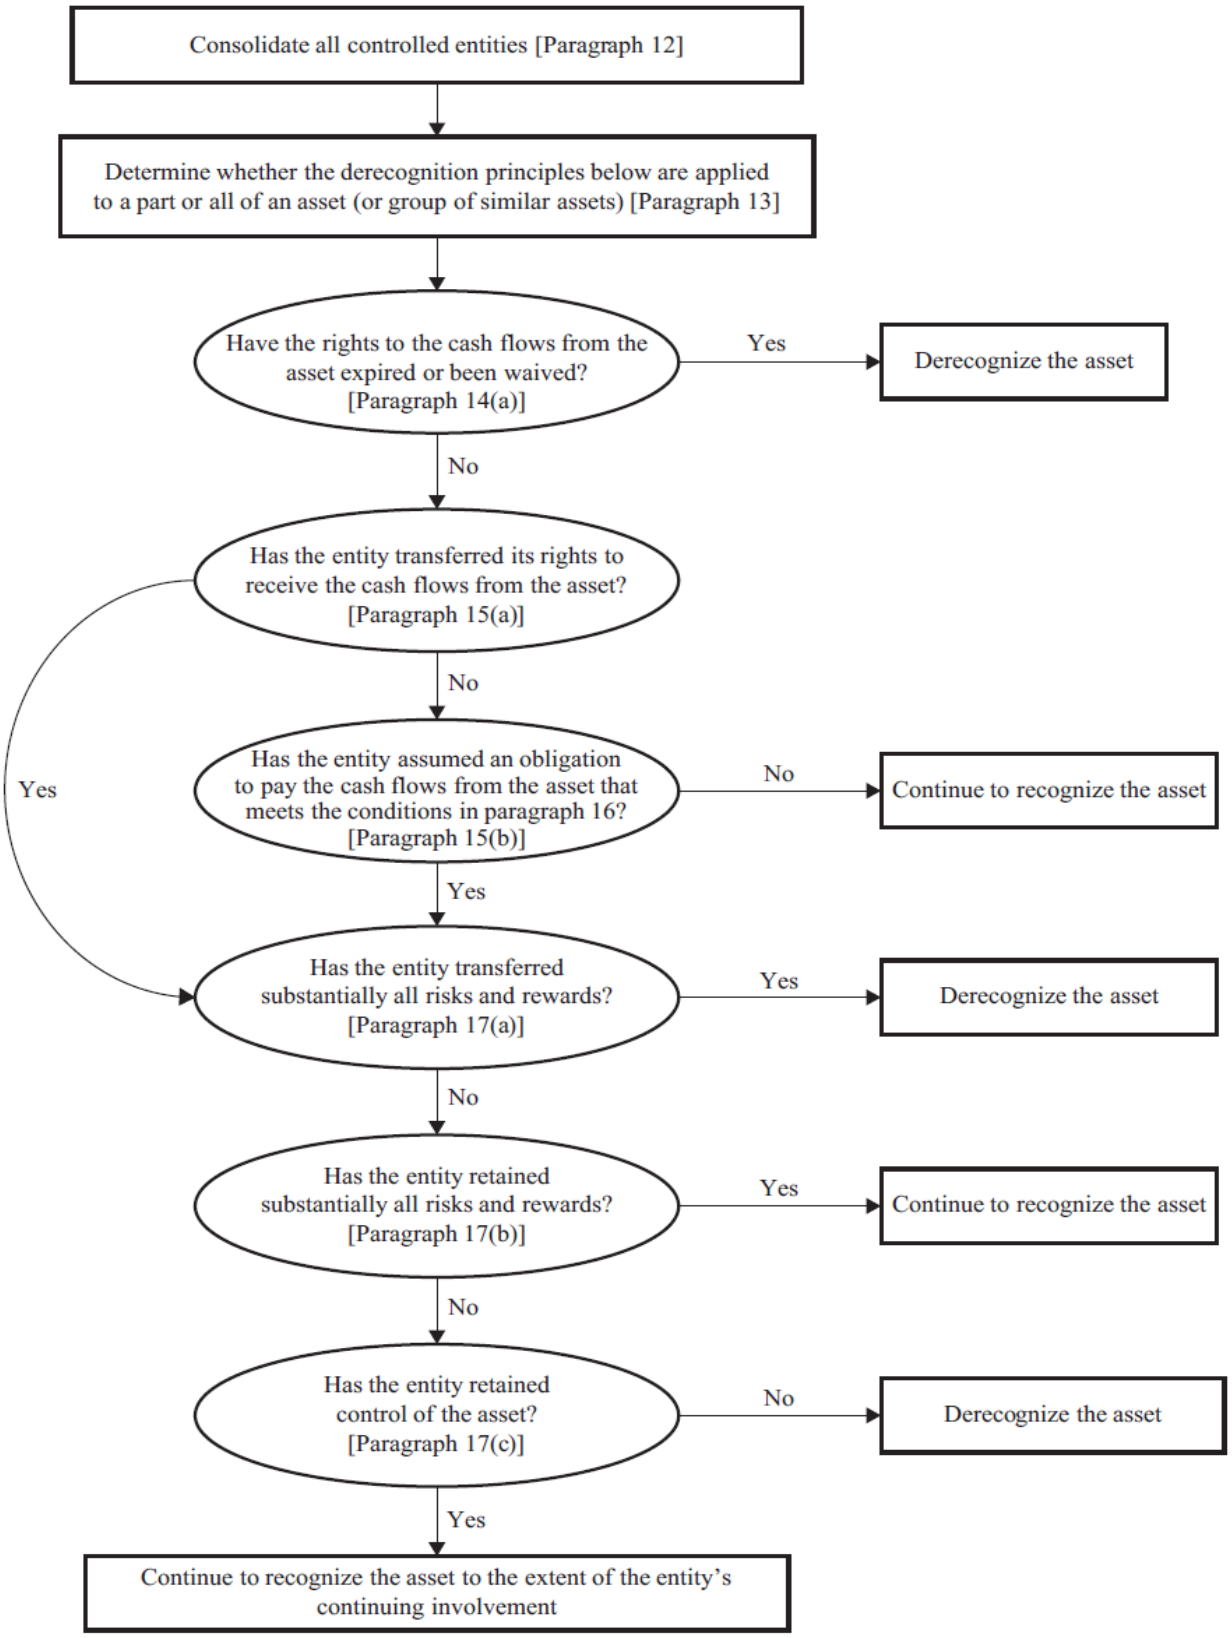
(c) A forward contract that is within the scope of this Standard (see paragraph 2) is recognized as an asset or a liability on the commitment date, instead of on the date on which settlement takes place. When an entity becomes a party to a forward contract, the fair values of the right and obligation are often equal, so that the net fair value of the forward is zero. If the net fair value of the right and obligation is not zero, the contract is recognized as an asset or liability.

(d) Option contracts that are within the scope of this Standard (see paragraph 2) are recognized as assets or liabilities when the holder or writer becomes a party to the contract.

(e) Planned future transactions, no matter how likely, are not assets and liabilities because the entity has not become a party to a contract.

Regular Way Purchase or Sale of Financial Assets

AG17. A regular way purchase or sale of financial assets is recognized using either trade date accounting or settlement date accounting as described in paragraphs AG19 and AG20. An entity shall apply the same method consistently for all purchases and sales of financial assets that are classified in the same way in accordance with this Standard. For this purpose assets that are mandatorily measured at fair value through surplus or deficit form a separate classification from assets designated as measured at fair value through surplus or deficit. In addition, investments in equity instruments accounted for using the option provided in paragraph 106 form a separate classification.



AG18. A contract that requires or permits net settlement of the change in the value of the contract is not a regular way contract. Instead, such a contract is accounted for as a derivative in the period between the trade date and the settlement date.

AG19. The trade date is the date that an entity commits itself to purchase or sell an asset. Trade date accounting refers to (a) the recognition of an asset to be received and the liability to pay for it on the trade date, and (b) derecognition of an asset that is sold, recognition of any gain or loss on disposal and the recognition of a receivable from the buyer for payment on the trade date. Generally, interest does not start to accrue on the asset and corresponding liability until the settlement date when title passes.

AG20. The settlement date is the date that an asset is delivered to or by an entity. Settlement date accounting refers to (a) the recognition of an asset on the day it is received by the entity, and (b) the derecognition of an asset and recognition of any gain or loss on disposal on the day that it is delivered by the entity. When settlement date accounting is applied an entity accounts for any change in the fair value of the asset to be received during the period between the trade date and the settlement date in the same way as it accounts for the acquired asset. In other words, the change in value is not recognized for assets measured at amortized cost; it is recognized in surplus or deficit for assets classified as financial assets measured at fair value through surplus or deficit; and it is recognized in net assets/equity for financial assets measured at fair value through net assets/equity in accordance with paragraph 41 and for investments in equity instruments accounted for in accordance with paragraph 106.

Derecognition of Financial Assets

AG21. The following flow chart illustrates the evaluation of whether and to what extent a financial asset is derecognized.

Arrangements Under which an Entity Retains the Contractual Rights to Receive the Cash Flows of a Financial Asset, but Assumes a Contractual Obligation to Pay the Cash Flows to One or More Recipients (paragraph 15(b))

AG22. The situation described in paragraph 15(b) (when an entity retains the contractual rights to receive the cash flows of the financial asset, but assumes a contractual obligation to pay the cash flows to one or more recipients) occurs, for example, if the entity is a trust, and issues to investors beneficial interests in the underlying financial assets that it owns and provides servicing of those financial assets. In that case, the financial assets qualify for derecognition if the conditions in paragraphs 16 and 17 are met.

AG23. In applying paragraph 16, the entity could be, for example, the originator of the financial asset, or it could be an economic entity that includes a controlled entity that has acquired the financial asset and passes on cash flows to unrelated third party investors.

Evaluation of the Transfer of Risks and Rewards of Ownership (paragraph 17)

AG24. Examples of when an entity has transferred substantially all the risks and rewards of ownership are:

(a) An unconditional sale of a financial asset;

(b) A sale of a financial asset together with an option to repurchase the financial asset at its fair value at the time of repurchase; and

(c) A sale of a financial asset together with a put or call option that is deeply out of the money (i.e., an option that is so far out of the money it is highly unlikely to go into the money before expiry).

AG25. Examples of when an entity has retained substantially all the risks and rewards of ownership are:

(a) A sale and repurchase transaction where the repurchase price is a fixed price or the sale price plus a lender’s return;

(b) A securities lending agreement;

(c) A sale of a financial asset together with a total return swap that transfers the market risk exposure back to the entity;

(d) A sale of a financial asset together with a deep in-the-money put or call option (i.e., an option that is so far in the money that it is highly unlikely to go out of the money before expiry); and

(e) A sale of short-term receivables in which the entity guarantees to compensate the transferee for credit losses that are likely to occur.

AG26. If an entity determines that as a result of the transfer, it has transferred substantially all the risks and rewards of ownership of the transferred asset, it does not recognize the transferred asset again in a future period, unless it reacquires the transferred asset in a new transaction.

Evaluation of the Transfer of Control

AG27. An entity has not retained control of a transferred asset if the transferee has the practical ability to sell the transferred asset. An entity has retained control of a transferred asset if the transferee does not have the practical ability to sell the transferred asset. A transferee has the practical ability to sell the transferred asset if it is traded in an active market because the transferee could repurchase the transferred asset in the market if it needs to return the asset to the entity. For example, a transferee may have the practical ability to sell a transferred asset if the transferred asset is subject to an option that allows the entity to repurchase it, but the transferee can readily obtain the transferred asset in the market if the option is exercised. A transferee does not have the practical ability to sell the transferred asset if the entity retains such an option and the transferee cannot readily obtain the transferred asset in the market if the entity exercises its option.

AG28. The transferee has the practical ability to sell the transferred asset only if the transferee can sell the transferred asset in its entirety to an unrelated third party and is able to exercise that ability unilaterally and without imposing additional restrictions on the transfer. The critical question is what the transferee is able to do in practice, not what contractual rights the transferee has concerning what it can do with the transferred asset or what contractual prohibitions exist. In particular:

(a) A contractual right to dispose of the transferred asset has little practical effect if there is no market for the transferred asset, and

(b) An ability to dispose of the transferred asset has little practical effect if it cannot be exercised freely. For that reason:

(i) The transferee's ability to dispose of the transferred asset must be independent of the actions of others (i.e., it must be a unilateral ability), and

(ii) The transferee must be able to dispose of the transferred asset without needing to attach restrictive conditions or "strings" to the transfer (e.g., conditions about how a loan asset is serviced or an option giving the transferee the right to repurchase the asset).

AG29. That the transferee is unlikely to sell the transferred asset does not, of itself, mean that the transferor has retained control of the transferred asset. However, if a put option or guarantee constrains the transferee from selling the transferred asset, then the transferor has retained control of the transferred asset. For example, if a put option or guarantee is sufficiently valuable it constrains the transferee from selling the transferred asset because the transferee would, in practice, not sell the transferred asset to a third party without attaching a similar option or other restrictive conditions. Instead, the transferee would hold the transferred asset so as to obtain payments under the guarantee or put option. Under these circumstances the transferor has retained control of the transferred asset.

Transfers that Qualify for Derecognition

AG30. An entity may retain the right to a part of the interest payments on transferred assets as compensation for servicing those assets. The part of the interest payments that the entity would give up upon termination or transfer of the servicing contract is allocated to the servicing asset or servicing liability. The part of the interest payments that the entity would not give up is an interest-only strip receivable. For example, if the entity would not give up any interest upon termination or transfer of the servicing contract, the entire interest spread is an interest-only strip receivable. For the purposes of applying paragraph 24, the fair values of the servicing asset and interest-only strip receivable are used to allocate the carrying amount of the receivable between the part of the asset that is derecognized and the part that continues to be recognized. If there is no servicing fee specified or the fee to be received is not expected to compensate the entity adequately for performing the servicing, a liability for the servicing obligation is recognized at fair value.

AG31. When measuring the fair values of the part that continues to be recognized and the part that is derecognized for the purposes of applying paragraph 24, an entity applies the fair value measurement requirements in IPSAS 46 in addition to paragraph 25.

Transfers that do not Qualify for Derecognition

AG32. The following is an application of the principle outlined in paragraph 26. If a guarantee provided by the entity for default losses on the transferred asset prevents a transferred asset from being derecognized because the entity has retained substantially all the risks and rewards of ownership of the transferred asset, the transferred asset continues to be recognized in its entirety and the consideration received is recognized as a liability.

Sale of Future Flows Arising from a Sovereign Right

AG33. In the public sector, securitization schemes may involve a sale of future flows arising from a sovereign right, such as a right to taxation, that have not previously been recognized as assets. An entity recognizes the revenue arising from such transactions in accordance with IPSAS 47. Such transactions may give rise to financial liabilities as defined in IPSAS 28. Examples of such financial liabilities may include but are not limited to borrowings, financial guarantees, liabilities arising from a servicing or administrative contract, or payables relating to cash collected on behalf of the purchasing entity. Financial liabilities shall be recognized when the entity becomes party to the contractual provisions of the instrument in accordance with paragraph 10 and classified in accordance with paragraphs 45 and 46. The financial liabilities shall be initially recognized in accordance with paragraph 57, and subsequently measured in accordance with paragraphs 62 and 63.

Continuing Involvement in Transferred Assets

AG34. The following are examples of how an entity measures a transferred asset and the associated liability under paragraph 27.

All Assets

(a) If a guarantee provided by an entity through a contract to pay for default losses on a transferred asset prevents the transferred asset from being derecognized to the extent of the continuing involvement, the transferred asset at the date of the transfer is measured at the lower of (i) the carrying amount of the asset and (ii) the maximum amount of the consideration received in the transfer that the entity could be required to repay (‘the guarantee amount’). The associated liability is initially measured at the guarantee amount plus the fair value of the guarantee (which is normally the consideration received for the guarantee). Subsequently, the initial fair value of the guarantee is recognized in surplus or deficit when (or as) the compliance obligation is satisfied (in accordance with the principles of IPSAS 47) and the carrying value of the asset is reduced by any loss allowance.

Assets Measured at Amortized Cost

(b) If a put option obligation written by an entity or call option right held by an entity prevents a transferred asset from being derecognized and the entity measures the transferred asset at amortized cost, the associated liability is measured at its cost (i.e., the consideration received) adjusted for the amortization of any difference between that cost and the gross carrying amount of the transferred asset at the expiration date of the option. For example, assume that the gross carrying amount of the asset on the date of the transfer is CU98 and that the consideration received is CU95. The gross carrying amount of the asset on the option exercise date will be CU100. The initial carrying amount of the associated liability is CU95 and the difference between CU95 and CU100 is recognized in surplus or deficit using the effective interest method. If the option is exercised, any difference between the carrying amount of the associated liability and the exercise price is recognized in surplus or deficit.

Assets Measured at Fair Value

(c) If a call option right retained by an entity prevents a transferred asset from being derecognized and the entity measures the transferred asset at fair value, the asset continues to be measured at its fair value. The associated liability is measured at (i) the option exercise price less the time value of the option if the option is in or at the money, or (ii) the fair value of the transferred asset less the time value of the option if the option is out of the money. The adjustment to the measurement of the associated liability ensures that the net carrying amount of the asset and the associated liability is the fair value of the call option right. For example, if the fair value of the underlying asset is CU80, the option exercise price is CU95 and the time value of the option is CU5, the carrying amount of the associated liability is CU75 (CU80 – CU5) and the carrying amount of the transferred asset is CU80 (i.e., its fair value).

(d) If a put option written by an entity prevents a transferred asset from being derecognized and the entity measures the transferred asset at fair value, the associated liability is measured at the option exercise

price plus the time value of the option. The measurement of the asset at fair value is limited to the lower of the fair value and the option exercise price because the entity has no right to increases in the fair value of the transferred asset above the exercise price of the option. This ensures that the net carrying amount of the asset and the associated liability is the fair value of the put option obligation. For example, if the fair value of the underlying asset is CU120, the option exercise price is CU100 and the time value of the option is CU5, the carrying amount of the associated liability is CU105 (CU100 + CU5) and the carrying amount of the asset is CU100 (in this case the option exercise price).

(e) If a collar, in the form of a purchased call and written put, prevents a transferred asset from being derecognized and the entity measures the asset at fair value, it continues to measure the asset at fair value. The associated liability is measured at (i) the sum of the call exercise price and fair value of the put option less the time value of the call option, if the call option is in or at the money, or (ii) the sum of the fair value of the asset and the fair value of the put option less the time value of the call option if the call option is out of the money. The adjustment to the associated liability ensures that the net carrying amount of the asset and the associated liability is the fair value of the options held and written by the entity. For example, assume an entity transfers a financial asset that is measured at fair value while simultaneously purchasing a call with an exercise price of CU120 and writing a put with an exercise price of CU80. Assume also that the fair value of the asset is CU100 at the date of the transfer. The time value of the put and call are CU1 and CU5 respectively. In this case, the entity recognizes an asset of CU100 (the fair value of the asset) and a liability of CU96 [(CU100 + CU1) – CU5]. This gives a net asset value of CU4, which is the fair value of the options held and written by the entity.

All Transfers

AG35. To the extent that a transfer of a financial asset does not qualify for derecognition, the transferor's contractual rights or obligations related to the transfer are not accounted for separately as derivatives if recognizing both the derivative and either the transferred asset or the liability arising from the transfer would result in recognizing the same rights or obligations twice. For example, a call option retained by the transferor may prevent a transfer of financial assets from being accounted for as a sale. In that case, the call option is not separately recognized as a derivative asset.

AG36. To the extent that a transfer of a financial asset does not qualify for derecognition, the transferee does not recognize the transferred asset as its asset. The transferee derecognizes the cash or other consideration paid and recognizes a receivable from the transferor. If the transferor has both a right and an obligation to reacquire control of the entire transferred asset for a fixed amount (such as under a repurchase agreement), the transferee may measure its receivable at amortized cost if it meets the criteria in paragraph 40.

Examples

AG37. The following examples illustrate the application of the derecognition principles of this Standard.

(a) Repurchase agreements and securities lending. If a financial asset is sold under an agreement to repurchase it at a fixed price or at the sale price plus a lender's return or if it is loaned under an agreement to return it to the transferor, it is not derecognized because the transferor retains substantially all the risks and rewards of ownership. If the transferee obtains the right to sell or pledge the asset, the transferor reclassifies the asset in its statement of financial position, for example, as a loaned asset or repurchase receivable.

(b) Repurchase agreements and securities lending—assets that are substantially the same. If a financial asset is sold under an agreement to repurchase the same or substantially the same asset at a fixed price or at the sale price plus a lender's return or if a financial asset is borrowed or loaned under an agreement to return the same or substantially the same asset to the transferor, it is not derecognized because the transferor retains substantially all the risks and rewards of ownership.

(c) Repurchase agreements and securities lending—right of substitution. If a repurchase agreement at a fixed repurchase price or a price equal to the sale price plus a lender's return, or a similar securities lending transaction, provides the transferee with a right to substitute assets that are similar and of equal fair value to the transferred asset at the repurchase date, the asset sold or lent under a repurchase or securities lending transaction is not derecognized because the transferor retains substantially all the risks and rewards of ownership.

(d) Repurchase right of first refusal at fair value. If an entity sells a financial asset and retains only a right of first refusal to repurchase the transferred asset at fair value if the transferee subsequently sells it, the entity derecognizes the asset because it has transferred substantially all the risks and rewards of ownership.

(e) Wash sale transaction. The repurchase of a financial asset shortly after it has been sold is sometimes referred to as a wash sale. Such a repurchase does not preclude derecognition provided that the original transaction met the derecognition requirements. However, if an agreement to sell a financial asset is entered into concurrently with an agreement to repurchase the same asset at a fixed price or the sale price plus a lender's return, then the asset is not derecognized.

(f) Put options and call options that are deeply in the money. If a transferred financial asset can be called back by the transferor and the call option is deeply in the money, the transfer does not qualify for derecognition because the transferor has retained substantially all the risks and rewards of ownership. Similarly, if the financial asset can be put back by the transferee and the put option is deeply in the money, the transfer does not qualify for derecognition because the transferor has retained substantially all the risks and rewards of ownership.

(g) Put options and call options that are deeply out of the money. A financial asset that is transferred subject only to a deep out-of-the-money put option held by the transferee or a deep out-of-the-money call option held by the transferor is derecognized. This is because the transferor has transferred substantially all the risks and rewards of ownership.

(h) Readily obtainable assets subject to a call option that is neither deeply in the money nor deeply out of the money. If an entity holds a call option on an asset that is readily obtainable in the market and the option is neither deeply in the money nor deeply out of the money, the asset is derecognized. This is because the entity (i) has neither retained nor transferred substantially all the risks and rewards of ownership, and (ii) has not retained control. However, if the asset is not readily obtainable in the market, derecognition is precluded to the extent of the amount of the asset that is subject to the call option because the entity has retained control of the asset.

(i) A not readily obtainable asset subject to a put option written by an entity that is neither deeply in the money nor deeply out of the money. If an entity transfers a financial asset that is not readily obtainable in the market, and writes a put option that is not deeply out of the money, the entity neither retains nor transfers substantially all the risks and rewards of ownership because of the written put option. The entity retains control of the asset if the put option is sufficiently valuable to prevent the transferee from selling the asset, in which case the asset continues to be recognized to the extent of the transferor's continuing involvement (see paragraph AG29). The entity transfers control of the asset if the put option is not sufficiently valuable to prevent the transferee from selling the asset, in which case the asset is derecognized.

(j) Assets subject to a fair value put or call option or a forward repurchase agreement. A transfer of a financial asset that is subject only to a put or call option or a forward repurchase agreement that has an exercise or repurchase price equal to the fair value of the financial asset at the time of repurchase results in derecognition because of the transfer of substantially all the risks and rewards of ownership.

(k) Cash-settled call or put options. An entity evaluates the transfer of a financial asset that is subject to a put or call option or a forward repurchase agreement that will be settled net in cash to determine whether it has retained or transferred substantially all the risks and rewards of ownership. If the entity has not retained substantially all the risks and rewards of ownership of the transferred asset, it determines whether it has retained control of the transferred asset. That the put or the call or the forward repurchase agreement is settled net in cash does not automatically mean that the entity has transferred control (see paragraphs AG29 and (g), (h) and (i) above).

(l) Removal of accounts provision. A removal of accounts provision is an unconditional repurchase (call) option that gives an entity the right to reclaim assets transferred subject to some restrictions. Provided that such an option results in the entity neither retaining nor transferring substantially all the risks and rewards of ownership, it precludes derecognition only to the extent of the amount subject to repurchase (assuming that the transferee cannot sell the assets). For example, if the carrying amount and proceeds from the transfer of loan assets are CU100,000 and any individual loan could be called back but the aggregate amount of loans that could be repurchased could not exceed CU10,000, CU90,000 of the loans would qualify for derecognition.

(m) Clean-up calls. An entity, which may be a transferor, that services transferred assets may hold a clean-up call to purchase remaining transferred assets when the amount of outstanding assets falls to a specified level at which the cost of servicing those assets becomes burdensome in relation to the benefits of servicing. Provided that such a clean-up call results in the entity neither retaining nor transferring substantially all the risks and rewards of ownership and the transferee cannot sell the assets, it precludes derecognition only to the extent of the amount of the assets that is subject to the call option.

(n) Subordinated retained interests and credit guarantees. An entity may provide the transferee with credit enhancement by subordinating some or all of its interest retained in the transferred asset. Alternatively, an entity may provide the transferee with credit enhancement in the form of a credit guarantee that could be unlimited or limited to a specified amount. If the entity retains substantially all the risks and rewards of ownership of the transferred asset, the asset continues to be recognized in its entirety. If the entity retains some, but not substantially all, of the risks and rewards of ownership and has retained control, derecognition is precluded to the extent of the amount of cash or other assets that the entity could be required to pay.

(o) Total return swaps. An entity may sell a financial asset to a transferee and enter into a total return swap with the transferee, whereby all of the interest payment cash flows from the underlying asset are remitted to the entity in exchange for a fixed payment or variable rate payment and any increases or declines in the fair value of the underlying asset are absorbed by the entity. In such a case, derecognition of all of the asset is prohibited.

(p) Interest rate swaps. An entity may transfer to a transferee a fixed rate financial asset and enter into an interest rate swap with the transferee to receive a fixed interest rate and pay a variable interest rate based on a notional amount that is equal to the principal amount of the transferred financial asset. The interest rate swap does not preclude derecognition of the transferred asset provided the payments on the swap are not conditional on payments being made on the transferred asset.

(q) Amortizing interest rate swaps. An entity may transfer to a transferee a fixed rate financial asset that is paid off over time, and enter into an amortizing interest rate swap with the transferee to receive a fixed interest rate and pay a variable interest rate based on a notional amount. If the notional amount of the swap amortizes so that it equals the principal amount of the transferred financial asset outstanding at any point in time, the swap would generally result in the entity retaining substantial prepayment risk, in which case the entity either continues to recognize all of the transferred asset or

continues to recognize the transferred asset to the extent of its continuing involvement. Conversely, if the amortization of the notional amount of the swap is not linked to the principal amount outstanding of the transferred asset, such a swap would not result in the entity retaining prepayment risk on the asset. Hence, it would not preclude derecognition of the transferred asset provided the payments on the swap are not conditional on interest payments being made on the transferred asset and the swap does not result in the entity retaining any other significant risks and rewards of ownership on the transferred asset.

(r) Write-off. An entity has no reasonable expectations of recovering the contractual cash flows on a financial asset in its entirety or a portion thereof.

AG38. This paragraph illustrates the application of the continuing involvement approach when the entity's continuing involvement is in a part of a financial asset.

Assume an entity has a portfolio of prepayable loans whose coupon and effective interest rate is 10 percent and whose principal amount and amortized cost is CU10,000. It enters into a transaction in which, in return for a payment of CU9,115, the transferee obtains the right to CU9,000 of any collections of principal plus interest thereon at 9.5 percent. The entity retains rights to CU1,000 of any collections of principal plus interest thereon at 10 percent, plus the excess spread of 0.5 percent on the remaining CU9,000 of principal. Collections from prepayments are allocated between the entity and the transferee proportionately in the ratio of 1:9, but any defaults are deducted from the entity's interest of CU1,000 until that interest is exhausted. The fair value of the loans at the date of the transaction is CU10,100 and the estimated fair value of the excess spread of 0.5 percent is CU40.

The entity determines that it has transferred some significant risks and rewards of ownership (for example, significant prepayment risk) but has also retained some significant risks and rewards of ownership (because of its subordinated retained interest) and has retained control. It therefore applies the continuing involvement approach.

To apply this Standard, the entity analyzes the transaction as (a) a retention of a fully proportionate retained interest of CU1,000, plus (b) the subordination of that retained interest to provide credit enhancement to the transferee for credit losses.

The entity calculates that CU9,090 (90 percent × CU10,100) of the consideration received of CU9,115 represents the consideration for a fully proportionate 90 percent share. The remainder of the consideration received (CU25) represents consideration received for subordinating its retained interest to provide credit enhancement to the transferee for credit losses. In addition, the excess spread of 0.5 percent represents consideration received for the credit enhancement. Accordingly, the total consideration received for the credit enhancement is CU65 (CU25 + CU40).

The entity calculates the gain or loss on the sale of the 90 percent share of cash flows. Assuming that separate fair values of the 90 percent part transferred and the 10 percent part retained are not available at the date of the transfer, the entity allocates the carrying amount of the asset in accordance with paragraph 25 as follows:

	Fair value	*Percentage*	*Allocated carrying amount*
Portion transferred	9,090	90 percent	9,000
Portion retained	1,010	10 percent	1,000
Total	**10,100**		**10,000**

The entity computes its gain or loss on the sale of the 90 percent share of the cash flows by deducting the allocated carrying amount of the portion transferred from the consideration received, i.e., CU90 (CU9,090 – CU9,000). The carrying amount of the portion retained by the entity is CU1,000.

In addition, the entity recognizes the continuing involvement that results from the subordination of its retained interest for credit losses. Accordingly, it recognizes an asset of CU1,000 (the maximum amount of the cash flows it would not receive under the subordination), and an associated liability of CU1,065 (which is the maximum amount of the cash flows it would not receive under the subordination, i.e., CU1,000 plus the fair value of the subordination of CU65).

The entity uses all of the above information to account for the transaction as follows:

	Debit	*Credit*
Original asset	—	9,000
Asset recognized for subordination or the residual interest	1,000	—
Asset for the consideration received in the form of excess spread	40	—
Surplus or deficit (gain on transfer)	—	90
Liability	—	1,065
Cash received	9,115	—
Total	**10,155**	**10,155**

Immediately following the transaction, the carrying amount of the asset is CU2,040 comprising CU1,000, representing the allocated cost of the portion retained, and CU1,040, representing the entity's additional continuing involvement from the subordination of its retained interest for credit losses (which includes the excess spread of CU40).

In subsequent periods, the entity recognizes the consideration received for the credit enhancement (CU65) on a time proportion basis, accrues interest on the recognized asset using the effective interest method and recognizes any impairment losses on the recognized assets. As an example of the latter, assume that in the following year there is an impairment loss on the underlying loans of CU300. The entity reduces its recognized asset by CU600 (CU300 relating to its retained interest and CU300 relating to the additional continuing involvement that arises from the subordination of its retained interest for impairment losses), and reduces its recognized liability by CU300. The net result is a charge to surplus or deficit for impairment losses of CU300.

Derecognition of Financial Liabilities

AG39. A financial liability (or part of it) is extinguished when the debtor either:

(a) Discharges the liability (or part of it) by paying the creditor, normally with cash, other financial assets, goods or services; or

(b) Is legally released from primary responsibility for the liability (or part of it) either by process of law or by the creditor. (If the debtor has given a guarantee this condition may still be met.)

AG40. If an issuer of a debt instrument repurchases that instrument, the debt is extinguished even if the issuer is a market maker in that instrument or intends to resell it in the near term.

AG41. Payment to a third party, including a trust (sometimes called 'in-substance defeasance'), does not, by itself, relieve the debtor of its primary obligation to the creditor, in the absence of legal release.

AG42. If a debtor pays a third party to assume an obligation and notifies its creditor that the third party has assumed its debt obligation, the debtor does not derecognize the debt obligation unless the condition in paragraph AG39(b) is met. If the debtor pays a third party to assume an obligation and obtains a legal release from its creditor, the debtor has extinguished the debt. However, if the debtor agrees to make payments on the debt to the third party or direct to its original creditor, the debtor recognizes a new debt obligation to the third party.

AG43. If a third party assumes an obligation of an entity, and the entity provides either no or only nominal consideration to that third party in return, an entity applies the derecognition requirements of this Standard as well as paragraphs AG155–AG158 of IPSAS 47.

AG44. Lenders will sometimes waive their right to collect debt owed by a public sector entity, for example, a national government may cancel a loan owed by a local government. This waiver of debt would constitute a legal release of the debt owing by the borrower to the lender. Where an entity's obligations have been waived as part of a non-exchange transaction it applies the derecognition requirements of this Standard as well as paragraphs AG155–AG158 of IPSAS 47.

AG45. Although legal release, whether judicially or by the creditor, results in derecognition of a liability, the entity may recognize a new liability if the derecognition criteria in paragraphs 12–34 are not met for the financial assets transferred. If those criteria are not met, the transferred assets are not derecognized, and the entity recognizes a new liability relating to the transferred assets.

AG46. For the purpose of paragraph 36, the terms are substantially different if the discounted present value of the cash flows under the new terms, including any fees paid net of any fees received and discounted using the original effective interest rate, is at least 10 percent different from the discounted present value of the remaining cash flows of the original financial liability. In determining those fees paid net of fees received, a borrower includes only fees paid or received between the borrower and the lender, including fees paid or received by either the borrower or lender on the other's behalf.

AG46A. If an exchange of debt instruments or modification of terms is accounted for as an extinguishment, any costs or fees incurred are recognized as part of the gain or loss on the extinguishment. If the exchange or modification is not accounted for as an extinguishment, any costs or fees incurred adjust the carrying amount of the liability and are amortized over the remaining term of the modified liability.

AG47. In some cases, a creditor releases a debtor from its present obligation to make payments, but the debtor assumes a guarantee obligation to pay if the party assuming primary responsibility defaults. In these circumstances the debtor:

(a) Recognizes a new financial liability based on the fair value of its obligation for the guarantee; and

(b) Recognizes a gain or loss based on the difference between (i) any proceeds paid and (ii) the carrying amount of the original financial liability less the fair value of the new financial liability.

Classification

Classification of Financial Assets

The Entity's Management Model for Financial Assets

AG48. Paragraph 39(a) requires an entity to classify financial assets on the basis of the entity's management model for the financial assets, unless paragraph 44 applies. An entity assesses whether its financial assets meet the condition in paragraph 40(a) or the condition in paragraph 41(a) on the basis of the management model as determined by the entity's key management personnel (as defined in IPSAS 20, Related Party Disclosures).

AG49. An entity's management model is determined at a level that reflects how groups of financial assets are managed together to achieve a particular objective. The entity's management model does not depend on management's intentions for an individual instrument. Accordingly, this condition is not an instrument-by-instrument approach to classification and should be determined on a higher level of aggregation. However, a single entity may have more than one management model for its financial instruments. Consequently, classification need not be determined at the reporting entity level. For example, an entity may hold a portfolio of investments that it manages in order to collect contractual cash flows and another portfolio of investments that it manages in order to trade to realize fair value changes. Similarly, in some circumstances, it may be appropriate to separate a portfolio of financial assets into sub-portfolios in order to reflect the level at which an entity manages those financial assets. For example, that may be the case if an entity originates or purchases a portfolio of mortgage loans and manages some of the loans with an objective of collecting contractual cash flows and manages the other loans with an objective of selling them.

AG50. An entity's management model refers to how an entity manages its financial assets in order to generate cash flows. That is, the entity's management model determines whether cash flows will result from collecting contractual cash flows, selling financial assets or both. Consequently, this assessment is not performed on the basis of scenarios that the entity does not reasonably expect to occur, such as so-called 'worst case' or 'stress case' scenarios. For example, if an entity expects that it will sell a particular portfolio of financial assets only in a stress case scenario, that scenario would not affect the entity's assessment of the management model for those assets if the entity reasonably expects that such a scenario will not occur. If cash flows are realized in a way that is different from the entity's expectations at the date that the entity assessed the management model (for example, if the entity sells more or fewer financial assets than it expected when it classified the assets), that does not give rise to a prior period error in the entity's financial statements (see IPSAS 3, Accounting Policies, Changes in Accounting Estimates and Errors) nor does it change the classification of the remaining financial assets held in that management model (i.e., those assets that the entity recognized in prior periods and still holds) as long as the entity considered all relevant information that was available at the time that it made the management model assessment. However, when an entity assesses the management model for newly originated or newly purchased financial assets, it must consider information about how cash flows were realized in the past, along with all other relevant information.

AG51. An entity's management model for financial assets is a matter of fact and not merely an assertion. It is typically observable through the activities that the entity undertakes to achieve the objective of the management model. An entity will need to use judgment when it assesses its management model for financial assets and that assessment is not determined by a single factor or activity. Instead, the entity must consider all relevant evidence that is available at the date of the assessment. Such relevant evidence includes, but is not limited to:

(a) How the performance of the management model and the financial assets held within that management model are evaluated and reported to the entity's key management personnel;

(b) The risks that affect the performance of the management model (and the financial assets held within that management model) and, in particular, the way in which those risks are managed; and

(c) How management is compensated (for example, whether the compensation is based on the fair value of the assets managed or on the contractual cash flows collected).

A Management Model Whose Objective is to Hold Assets in Order to Collect Contractual Cash Flows

AG52. Financial assets that are held within a management model whose objective is to hold assets in order to collect contractual cash flows are managed to realize cash flows by collecting contractual payments over the life of the instrument. That is, the entity manages the assets held within the portfolio to collect those particular

contractual cash flows (instead of managing the overall return on the portfolio by both holding and selling assets). In determining whether cash flows are going to be realized by collecting the financial assets' contractual cash flows, it is necessary to consider the frequency, value and timing of sales in prior periods, the reasons for those sales and expectations about future sales activity. However sales in themselves do not determine the management model and therefore cannot be considered in isolation. Instead, information about past sales and expectations about future sales provide evidence related to how the entity's stated objective for managing the financial assets is achieved and, specifically, how cash flows are realized. An entity must consider information about past sales within the context of the reasons for those sales and the conditions that existed at that time as compared to current conditions.

AG53. Although the objective of an entity's management model may be to hold financial assets in order to collect contractual cash flows, the entity need not hold all of those instruments until maturity. Thus an entity's management model can be to hold financial assets to collect contractual cash flows even when sales of financial assets occur or are expected to occur in the future.

AG54. The management model may be to hold assets to collect contractual cash flows even if the entity sells financial assets when there is an increase in the assets' credit risk. To determine whether there has been an increase in the assets' credit risk, the entity considers reasonable and supportable information, including forward looking information. Irrespective of their frequency and value, sales due to an increase in the assets' credit risk are not inconsistent with a management model whose objective is to hold financial assets to collect contractual cash flows because the credit quality of financial assets is relevant to the entity's ability to collect contractual cash flows. Credit risk management activities that are aimed at minimizing potential credit losses due to credit deterioration are integral to such a management model. Selling a financial asset because it no longer meets the credit criteria specified in the entity's documented investment policy is an example of a sale that has occurred due to an increase in credit risk. However, in the absence of such a policy, the entity may demonstrate in other ways that the sale occurred due to an increase in credit risk.

AG55. Sales that occur for other reasons, such as sales made to manage credit concentration risk (without an increase in the assets' credit risk), may also be consistent with a management model whose objective is to hold financial assets in order to collect contractual cash flows. In particular, such sales may be consistent with a management model whose objective is to hold financial assets in order to collect contractual cash flows if those sales are infrequent (even if significant in value) or insignificant in value both individually and in aggregate (even if frequent). If more than an infrequent number of such sales are made out of a portfolio and those sales are more than insignificant in value (either individually or in aggregate), the entity needs to assess whether and how such sales are consistent with an objective of collecting contractual cash flows. Whether a third party imposes the requirement to sell the financial assets, or that activity is at the entity's discretion, is not relevant to this assessment. An increase in the frequency or value of sales in a particular period is not necessarily inconsistent with an objective to hold financial assets in order to collect contractual cash flows, if an entity can explain the reasons for those sales and demonstrate why those sales do not reflect a change in the entity's management model. In addition, sales may be consistent with the objective of holding financial assets in order to collect contractual cash flows if the sales are made close to the maturity of the financial assets and the proceeds from the sales approximate the collection of the remaining contractual cash flows.

AG56. The following are examples of when the objective of an entity's management model may be to hold financial assets to collect the contractual cash flows. This list of examples is not exhaustive. Furthermore, the examples are not intended to discuss all factors that may be relevant to the assessment of the entity's management model nor specify the relative importance of the factors.

Example	Analysis
Example 1 An entity holds investments to collect their contractual cash flows. The funding needs of the entity are predictable and the maturity of its financial assets is matched to the entity's estimated funding needs. The entity performs credit risk management activities with the objective of minimizing credit losses. In the past, sales have typically occurred when the financial assets' credit risk has increased such that the assets no longer meet the credit criteria specified in the entity's documented investment policy. In addition, infrequent sales have occurred as a result of unanticipated funding needs. Reports to key management personnel focus on the credit quality of the financial assets and the contractual return. The entity also monitors fair values of the financial assets, among other information.	Although the entity considers, among other information, the financial assets' fair values from a liquidity perspective (i.e., the cash amount that would be realized if the entity needs to sell assets), the entity's objective is to hold the financial assets in order to collect the contractual cash flows. Sales would not contradict that objective if they were in response to an increase in the assets' credit risk, for example if the assets no longer meet the credit criteria specified in the entity's documented investment policy. Infrequent sales resulting from unanticipated funding needs (e.g., in a stress case scenario) also would not contradict that objective, even if such sales are significant in value.
Example 2 An entity's management model is to purchase portfolios of financial assets, such as loans. Those portfolios may or may not include financial assets that are credit-impaired. If payment on the loans is not made on a timely basis, the entity attempts to realize the contractual cash flows through various means—for example, by contacting the debtor by mail, telephone or other methods. The entity's objective is to collect the contractual cash flows and the entity does not manage any of the loans in this portfolio with an objective of realizing cash flows by selling them. In some cases, the entity enters into interest rate swaps to change the interest rate on particular financial assets in a portfolio from a floating interest rate to a fixed interest rate.	The objective of the entity's management model is to hold the financial assets in order to collect the contractual cash flows. The same analysis would apply even if the entity does not expect to receive all of the contractual cash flows (e.g., some of the financial assets are credit-impaired at initial recognition). Moreover, the fact that the entity enters into derivatives to modify the cash flows of the portfolio does not in itself change the entity's management model.
Example 3 An entity has a management model with the objective of originating student loans and subsequently selling those loans to a securitization vehicle. The securitization vehicle issues instruments to investors. The originating entity controls the securitization vehicle and thus consolidates it. The securitization vehicle collects the contractual cash flows from the loans and passes them on to its investors.	The consolidated economic entity originated the loans with the objective of holding them to collect the contractual cash flows. However, the originating entity has an objective of realizing cash flows on the loan portfolio by selling the loans to the securitization vehicle, so for the purposes of its separate financial statements it would not be considered to be managing this portfolio in order to collect the contractual cash flows.

Example	Analysis
It is assumed for the purposes of this example that the loans continue to be recognized in the consolidated statement of financial position because they are not derecognized by the securitization vehicle.	
Example 4 A local government entity that issues bonds holds financial assets to meet redemption needs in a 'stress case' scenario (e.g., a run on the government's issued securities). The entity does not anticipate selling these assets except in such scenarios. The entity monitors the credit quality of the financial assets and its objective in managing the financial assets is to collect the contractual cash flows. The entity evaluates the performance of the assets on the basis of interest revenue earned and credit losses realized. However, the entity also monitors the fair value of the financial assets from a liquidity perspective to ensure that the cash amount that would be realized if the entity needed to sell the assets in a stress case scenario would be sufficient to meet the entity's liquidity needs. Periodically, the entity makes sales that are insignificant in value to demonstrate liquidity.	The objective of the entity's management model is to hold the financial assets to collect contractual cash flows. The analysis would not change even if during a previous stress case scenario the entity had sales that were significant in value in order to meet its redemption needs. Similarly, recurring sales activity that is insignificant in value is not inconsistent with holding financial assets to collect contractual cash flows. In contrast, if an entity holds financial assets to meet its everyday redemption needs and meeting that objective involves frequent sales that are significant in value, the objective of the entity's management model is not to hold the financial assets to collect contractual cash flows. Similarly, if the entity is required by law or regulation to routinely sell financial assets to demonstrate that the assets are liquid, and the value of the assets sold is significant, the entity's management model is not to hold financial assets to collect contractual cash flows. Whether a third party imposes the requirement to sell the financial assets, or that activity is at the entity's discretion, is not relevant to the analysis.

A Management Model Whose Objective is Achieved by Both Collecting Contractual Cash Flows and Selling Financial Assets

AG57. An entity may hold financial assets in a management model whose objective is achieved by both collecting contractual cash flows and selling financial assets. In this type of management model, the entity's key management personnel have made a decision that both collecting contractual cash flows and selling financial assets are integral to achieving the objective of the management model. There are various objectives that may be consistent with this type of management model. For example, the objective of the management model may be to manage everyday liquidity needs, to maintain a particular interest yield profile or to match the duration of the financial assets to the duration of the liabilities that those assets are funding. To achieve such an objective, the entity will both collect contractual cash flows and sell financial assets.

AG58. Compared to a management model whose objective is to hold financial assets to collect contractual cash flows, this management model will typically involve greater frequency and value of sales. This is because

selling financial assets is integral to achieving the management model's objective instead of being only incidental to it. However, there is no threshold for the frequency or value of sales that must occur in this management model because both collecting contractual cash flows and selling financial assets are integral to achieving its objective.

AG59. The following are examples of when the objective of the entity's management model may be achieved by both collecting contractual cash flows and selling financial assets. This list of examples is not exhaustive. Furthermore, the examples are not intended to describe all the factors that may be relevant to the assessment of the entity's management model nor specify the relative importance of the factors.

Example	Analysis
Example 5 An entity anticipates capital expenditure in a few years. The entity invests its excess cash in short and long-term financial assets so that it can fund the expenditure when the need arises. Many of the financial assets have contractual lives that exceed the entity's anticipated investment period. The entity will hold financial assets to collect the contractual cash flows and, when an opportunity arises, it will sell financial assets to re-invest the cash in financial assets with a higher return. The managers responsible for the portfolio are remunerated based on the overall return generated by the portfolio.	The objective of the management model is achieved by both collecting contractual cash flows and selling financial assets. The entity will make decisions on an ongoing basis about whether collecting contractual cash flows or selling financial assets will maximize the return on the portfolio until the need arises for the invested cash. In contrast, consider an entity that anticipates a cash outflow in five years to fund capital expenditure and invests excess cash in short-term financial assets. When the investments mature, the entity reinvests the cash in new short-term financial assets. The entity maintains this strategy until the funds are needed, at which time the entity uses the proceeds from the maturing financial assets to fund the capital expenditure. Only sales that are insignificant in value occur before maturity (unless there is an increase in credit risk). The objective of this contrasting management model is to hold financial assets to collect contractual cash flows.
Example 6 An entity holds financial assets to meet its everyday liquidity needs. The entity seeks to minimize the costs of managing those liquidity needs and therefore actively manages the return on the portfolio. That return consists of collecting contractual payments as well as gains and losses from the sale of financial assets. As a result, the entity holds financial assets to collect contractual cash flows and sells financial assets to reinvest in higher yielding financial assets or to better match the duration of its liabilities. In the past, this strategy has resulted in frequent sales activity and such sales have been significant in value. This activity is expected to continue in the future.	The objective of the management model is to maximize the return on the portfolio to meet everyday liquidity needs and the entity achieves that objective by both collecting contractual cash flows and selling financial assets. In other words, both collecting contractual cash flows and selling financial assets are integral to achieving the management model's objective.
Example 7 A social security fund holds financial assets in order to fund social security liabilities. The fund uses the proceeds from the contractual cash flows on the financial assets to settle social security liabilities as they come due. To ensure that the contractual cash flows from the financial assets are sufficient to settle those liabilities, the fund undertakes significant buying and selling activity on a regular basis to rebalance its portfolio of assets and to meet cash flow needs as they arise.	The objective of the management model is to fund the social security liabilities. To achieve this objective, the entity collects contractual cash flows as they come due and sells financial assets to maintain the desired profile of the asset portfolio. Thus both collecting contractual cash flows and selling financial assets are integral to achieving the management model's objective.

Other Management Models

AG60. Financial assets are measured at fair value through surplus or deficit if they are not held within a management model whose objective is to hold assets to collect contractual cash flows or within a management model whose objective is achieved by both collecting contractual cash flows and selling financial assets (but see also paragraph 106). One management model that results in measurement at fair value through surplus or deficit is one in which an entity manages the financial assets with the objective of realizing cash flows through the sale of the assets. The entity makes decisions based on the assets' fair values and manages the assets to realize those fair values. In this case, the entity's objective will typically result in active buying and selling. Even though the entity will collect contractual cash flows while it holds the financial assets, the objective of such a management model is not achieved by both collecting contractual cash flows and selling financial assets. This is because the collection of contractual cash flows is not integral to achieving the management model's objective; instead, it is incidental to it.

AG61. A portfolio of financial assets that is managed and whose performance is evaluated on a fair value basis (as described in paragraph 46(b)) is neither held to collect contractual cash flows nor held both to collect contractual cash flows and to sell financial assets. The entity is primarily focused on fair value information and uses that information to assess the assets' performance and to make decisions. In addition, a portfolio of financial assets that meets the definition of held for trading is not held to collect contractual cash flows or held both to collect contractual cash flows and to sell financial assets. For such portfolios, the collection of contractual cash flows is only incidental to achieving the management model's objective. Consequently, such portfolios of financial assets must be measured at fair value through surplus or deficit.

Contractual Cash Flows that are Solely Payments of Principal and Interest on the Principal Amount Outstanding

AG62. Paragraph 39(b) requires an entity to classify a financial asset on the basis of its contractual cash flow characteristics if the financial asset is held within a management model whose objective is to hold assets to collect contractual cash flows or within a management model whose objective is achieved by both collecting contractual cash flows and selling financial assets, unless paragraph 44 applies. To do so, the condition in paragraphs 40(b) and 41(b) requires an entity to determine whether the asset's contractual cash flows are solely payments of principal and interest on the principal amount outstanding.

AG63. Contractual cash flows that are solely payments of principal and interest on the principal amount outstanding are consistent with a basic lending arrangement. In a basic lending arrangement, consideration for the time value of money (see paragraphs AG67–AG71) and credit risk are typically the most significant elements of interest. However, in such an arrangement, interest can also include consideration for other basic lending risks (for example, liquidity risk) and costs (for example, administrative costs) associated with holding the financial asset for a particular period of time. In addition, interest can include a profit margin that is consistent with a basic lending arrangement. In extreme economic circumstances, interest can be negative if, for example, the holder of a financial asset either explicitly or implicitly pays for the deposit of its money for a particular period of time (and that fee exceeds the consideration that the holder receives for the time value of money, credit risk and other basic lending risks and costs). However, contractual terms that introduce exposure to risks or volatility in the contractual cash flows that is unrelated to a basic lending arrangement, such as exposure to changes in equity prices, commodity prices, a specific profitability or income threshold being reached by the borrower or lender, or the achievement (or otherwise) of specific financial or other ratios, do not give rise to contractual cash flows that are solely payments of principal and interest on the principal amount outstanding. An originated or a purchased financial asset can be a basic lending arrangement irrespective of whether it is a loan in its legal form.

AG64. In accordance with paragraph 42(a), principal is the fair value of the financial asset at initial recognition. However that principal amount may change over the life of the financial asset (for example, if there are repayments of principal).

AG65. An entity shall assess whether contractual cash flows are solely payments of principal and interest on the principal amount outstanding for the currency in which the financial asset is denominated.

AG66. Leverage is a contractual cash flow characteristic of some financial assets. Leverage increases the variability of the contractual cash flows with the result that they do not have the economic characteristics of interest. Stand-alone option, forward and swap contracts are examples of financial assets that include such leverage. Thus, such contracts do not meet the condition in paragraphs 40(b) and 41(b) and cannot be subsequently measured at amortized cost or fair value through net assets/equity.

Consideration for the Time Value of Money

AG67. Time value of money is the element of interest that provides consideration for only the passage of time. That is, the time value of money element does not provide consideration for other risks or costs associated with holding the financial asset. In order to assess whether the element provides consideration for only the passage of time, an entity applies judgment and considers relevant factors such as the currency in which the financial asset is denominated and the period for which the interest rate is set.

AG68. However, in some cases, the time value of money element may be modified (i.e., imperfect). That would be the case, for example, if a financial asset's interest rate is periodically reset but the frequency of that reset does not match the tenor of the interest rate (for example, the interest rate resets every month to a one-year rate) or if a financial asset's interest rate is periodically reset to an average of particular short and long-term interest rates. In such cases, an entity must assess the modification to determine whether the contractual cash flows represent solely payments of principal and interest on the principal amount outstanding. In some circumstances, the entity may be able to make that determination by performing a qualitative assessment of the time value of money element whereas, in other circumstances, it may be necessary to perform a quantitative assessment.

AG69. When assessing a modified time value of money element, the objective is to determine how different the contractual (undiscounted) cash flows could be from the (undiscounted) cash flows that would arise if the time value of money element was not modified (the benchmark cash flows). For example, if the financial asset under assessment contains a variable interest rate that is reset every month to a one-year interest rate, the entity would compare that financial asset to a financial instrument with identical contractual terms and the identical credit risk except the variable interest rate is reset monthly to a one-month interest rate. If the modified time value of money element could result in contractual (undiscounted) cash flows that are significantly different from the (undiscounted) benchmark cash flows, the financial asset does not meet the condition in paragraphs 40(b) and 41(b). To make this determination, the entity must consider the effect of the modified time value of money element in each reporting period and cumulatively over the life of the financial instrument. The reason for the interest rate being set in this way is not relevant to the analysis. If it is clear, with little or no analysis, whether the contractual (undiscounted) cash flows on the financial asset under the assessment could (or could not) be significantly different from the (undiscounted) benchmark cash flows, an entity need not perform a detailed assessment.

AG70. When assessing a modified time value of money element, an entity must consider factors that could affect future contractual cash flows. For example, if an entity is assessing a bond with a five-year term and the variable interest rate is reset every six months to a five-year rate, the entity cannot conclude that the contractual cash flows are solely payments of principal and interest on the principal amount outstanding simply because the interest rate curve at the time of the assessment is such that the difference between a five-year interest rate and a six-month interest rate is not significant. Instead, the entity must also consider whether the relationship between the five-year interest rate and the six-month interest rate could change over the life of the instrument such that the contractual (undiscounted) cash flows over the life of the instrument could be significantly different from the (undiscounted) benchmark cash flows. However, an entity must consider only reasonably possible scenarios instead of every possible scenario. If an entity concludes that

the contractual (undiscounted) cash flows could be significantly different from the (undiscounted) benchmark cash flows, the financial asset does not meet the condition in paragraphs 40(b) and 41(b) and therefore cannot be measured at amortized cost or fair value through net assets/equity.

AG71. In some jurisdictions, the government or a regulatory authority sets interest rates. For example, such government regulation of interest rates may be part of a broad macroeconomic policy or it may be introduced to encourage entities to invest in a particular sector of the economy. In some of these cases, the objective of the time value of money element is not to provide consideration for only the passage of time. However, despite paragraphs AG67–AG70, a regulated interest rate shall be considered a proxy for the time value of money element for the purpose of applying the condition in paragraphs 40(b) and 41(b) if that regulated interest rate provides consideration that is broadly consistent with the passage of time and does not provide exposure to risks or volatility in the contractual cash flows that are inconsistent with a basic lending arrangement.

Contractual Terms that Change the Timing or Amount of Contractual Cash Flows

AG72. If a financial asset contains a contractual term that could change the timing or amount of contractual cash flows (for example, if the asset can be prepaid before maturity or its term can be extended), the entity must determine whether the contractual cash flows that could arise over the life of the instrument due to that contractual term are solely payments of principal and interest on the principal amount outstanding. To make this determination, the entity must assess the contractual cash flows that could arise both before, and after, the change in contractual cash flows. The entity may also need to assess the nature of any contingent event (i.e., the trigger) that would change the timing or amount of the contractual cash flows. While the nature of the contingent event in itself is not a determinative factor in assessing whether the contractual cash flows are solely payments of principal and interest, it may be an indicator. For example, compare a financial instrument with an interest rate that is reset to a higher rate if the debtor misses a particular number of payments to a financial instrument with an interest rate that is reset to a higher rate if a specified equity index reaches a particular level. It is more likely in the former case that the contractual cash flows over the life of the instrument will be solely payments of principal and interest on the principal amount outstanding because of the relationship between missed payments and an increase in credit risk. (See also paragraph AG80.)

AG73. The following are examples of contractual terms that result in contractual cash flows that are solely payments of principal and interest on the principal amount outstanding:

(a) A variable interest rate that consists of consideration for the time value of money, the credit risk associated with the principal amount outstanding during a particular period of time (the consideration for credit risk may be determined at initial recognition only, and so may be fixed) and other basic lending risks and costs, as well as a profit margin;

(b) A contractual term that permits the issuer (i.e., the debtor) to prepay a debt instrument or permits the holder (i.e., the creditor) to put a debt instrument back to the issuer before maturity and the prepayment amount substantially represents unpaid amounts of principal and interest on the principal amount outstanding, which may include reasonable compensation for the early termination of the contract; and

(c) A contractual term that permits the issuer or the holder to extend the contractual term of a debt instrument (i.e., an extension option) and the terms of the extension option result in contractual cash flows during the extension period that are solely payments of principal and interest on the principal amount outstanding, which may include reasonable compensation for the extension of the contract.

AG74. Despite paragraph AG72, a financial asset that would otherwise meet the condition in paragraphs 40(b) and 41(b) but does not do so only as a result of a contractual term that permits (or requires) the issuer to prepay a debt instrument or permits (or requires) the holder to put a debt instrument back to the issuer before maturity

is eligible to be measured at amortized cost or fair value through net assets/equity (subject to meeting the condition in paragraph 40(a) or the condition in paragraph 41(a)) if:

(a) The entity acquires or originates the financial asset at a premium or discount to the contractual par amount;

(b) The prepayment amount substantially represents the contractual par amount and accrued (but unpaid) contractual interest, which may include reasonable compensation for the early termination of the contract; and

(c) When the entity initially recognizes the financial asset, the fair value of the prepayment feature is insignificant.

AG74A. For the purpose of applying paragraphs AG73(b) and AG74(b), irrespective of the event or circumstance that causes the early termination of the contract, a party may pay or receive reasonable compensation for that early termination. For example, a party may pay or receive reasonable compensation when it chooses to terminate the contract early (or otherwise causes the early termination to occur).

AG75. The following examples illustrate contractual cash flows that are solely payments of principal and interest on the principal amount outstanding. This list of examples is not exhaustive.

Instrument	**Analysis**
Instrument A Instrument A is a bond with a stated maturity date. Payments of principal and interest on the principal amount outstanding are linked to an inflation index of the currency in which the instrument is issued. The inflation link is not leveraged and the principal is protected.	The contractual cash flows are solely payments of principal and interest on the principal amount outstanding. Linking payments of principal and interest on the principal amount outstanding to an unleveraged inflation index resets the time value of money to a current level. In other words, the interest rate on the instrument reflects 'real' interest. Thus, the interest amounts are consideration for the time value of money on the principal amount outstanding. However, if the interest payments were indexed to another variable such as the debtor's performance (e.g., the debtor's surplus or deficit) or an equity index, the contractual cash flows are not payments of principal and interest on the principal amount outstanding (unless the indexing to the debtor's performance results in an adjustment that only compensates the holder for changes in the credit risk of the instrument, such that contractual cash flows are solely payments of principal and interest). That is because the contractual cash flows reflect a return that is inconsistent with a basic lending arrangement (see paragraph AG63).
Instrument B Instrument B is a variable interest rate instrument with a stated maturity date that permits the borrower to choose the market interest rate on an ongoing basis. For example, at each interest rate reset date, the borrower can choose to pay the three-month interbank offered rate	The contractual cash flows are solely payments of principal and interest on the principal amount outstanding as long as the interest paid over the life of the instrument reflects consideration for the time value of money, for the credit risk associated with the instrument and for other basic lending risks and costs, as well as a profit margin (see paragraph AG63). The fact that the interbank offered

Instrument	Analysis
for a three-month term or one-month interbank offered rate for a one-month term.	rate interest rate is reset during the life of the instrument does not in itself disqualify the instrument. However, if the borrower is able to choose to pay a one-month interest rate that is reset every three months, the interest rate is reset with a frequency that does not match the tenor of the interest rate. Consequently, the time value of money element is modified. Similarly, if an instrument has a contractual interest rate that is based on a term that can exceed the instrument's remaining life (for example, if an instrument with a five-year maturity pays a variable rate that is reset periodically but always reflects a five-year maturity), the time value of money element is modified. That is because the interest payable in each period is disconnected from the interest period. In such cases, the entity must qualitatively or quantitatively assess the contractual cash flows against those on an instrument that is identical in all respects except the tenor of the interest rate matches the interest period to determine if the cash flows are solely payments of principal and interest on the principal amount outstanding. (But see paragraph AG71 for guidance on regulated interest rates.) For example, in assessing a bond with a five-year term that pays a variable rate that is reset every six months but always reflects a five-year maturity, an entity considers the contractual cash flows on an instrument that resets every six months to a six-month interest rate but is otherwise identical. The same analysis would apply if the borrower is able to choose between the lender's various published interest rates (e.g., the borrower can choose between the lender's published one-month variable interest rate and the lender's published three-month variable interest rate).
Instrument C Instrument C is a bond with a stated maturity date and pays a variable market interest rate. That variable interest rate is capped.	The contractual cash flows of both: (a) an instrument that has a fixed interest rate and (b) an instrument that has a variable interest rate are payments of principal and interest on the principal amount outstanding as long as the interest reflects consideration for the time value of money, for the credit risk associated with the instrument during the term of the

Instrument	Analysis
	instrument and for other basic lending risks and costs, as well as a profit margin. (See paragraph AG63) Consequently, an instrument that is a combination of (a) and (b) (e.g., a bond with an interest rate cap) can have cash flows that are solely payments of principal and interest on the principal amount outstanding. Such a contractual term may reduce cash flow variability by setting a limit on a variable interest rate (e.g., an interest rate cap or floor) or increase the cash flow variability because a fixed rate becomes variable.
Instrument D Instrument D is a full recourse loan and is secured by collateral.	The fact that a full recourse loan is collateralized does not in itself affect the analysis of whether the contractual cash flows are solely payments of principal and interest on the principal amount outstanding.
Instrument E Instrument E is issued by a regulated bank and has a stated maturity date. The instrument pays a fixed interest rate and all contractual cash flows are non-discretionary.	The holder would analyze the contractual terms of the financial instrument to determine whether they give rise to cash flows that are solely payments of principal and interest on the principal amount outstanding and thus are consistent with a basic lending arrangement. That analysis would not consider the payments that arise only as a result of the national resolving authority's power to impose losses on the holders of Instrument E. That is because that power, and the resulting payments, are not contractual terms of the financial instrument.
However, the issuer is subject to legislation that permits or requires a national resolving authority to impose losses on holders of particular instruments, including Instrument E, in particular circumstances. For example, the national resolving authority has the power to write down the par amount of Instrument E or to convert it into a fixed number of the issuer's ordinary shares if the national resolving authority determines that the issuer is having severe financial difficulties, needs additional regulatory capital or is 'failing'.	In contrast, the contractual cash flows would not be solely payments of principal and interest on the principal amount outstanding if the contractual terms of the financial instrument permit or require the issuer or another entity to impose losses on the holder (e.g., by writing down the par amount or by converting the instrument into a fixed number of the issuer's ordinary shares) as long as those contractual terms are genuine, even if the probability is remote that such a loss will be imposed.

AG76. The following examples illustrate contractual cash flows that are not solely payments of principal and interest on the principal amount outstanding. This list of examples is not exhaustive.

Instrument	Analysis
Instrument F Instrument F is a bond that is convertible into a fixed number of equity instruments of the issuer.	The holder would analyze the convertible bond in its entirety. The contractual cash flows are not payments of principal and interest on the principal amount outstanding because

Instrument	Analysis
	they reflect a return that is inconsistent with a basic lending arrangement (see paragraph AG63); i.e., the return is linked to the value of the equity of the issuer.
Instrument G Instrument G is a loan that pays an inverse floating interest rate (i.e., the interest rate has an inverse relationship to market interest rates).	The contractual cash flows are not solely payments of principal and interest on the principal amount outstanding. The interest amounts are not consideration for the time value of money on the principal amount outstanding.
Instrument H Instrument H is a perpetual instrument but the issuer may call the instrument at any point and pay the holder the par amount plus accrued interest due. Instrument H pays a market interest rate but payment of interest cannot be made unless the issuer is able to remain solvent immediately afterwards. Deferred interest does not accrue additional interest.	The contractual cash flows are not payments of principal and interest on the principal amount outstanding. That is because the issuer may be required to defer interest payments and additional interest does not accrue on those deferred interest amounts. As a result, interest amounts are not consideration for the time value of money on the principal amount outstanding. If interest accrued on the deferred amounts, the contractual cash flows could be payments of principal and interest on the principal amount outstanding. The fact that Instrument H is perpetual does not in itself mean that the contractual cash flows are not payments of principal and interest on the principal amount outstanding. In effect, a perpetual instrument has continuous (multiple) extension options. Such options may result in contractual cash flows that are payments of principal and interest on the principal amount outstanding if interest payments are mandatory and must be paid in perpetuity. Also, the fact that Instrument H is callable does not mean that the contractual cash flows are not payments of principal and interest on the principal amount outstanding unless it is callable at an amount that does not substantially reflect payment of outstanding principal and interest on that principal amount outstanding. Even if the callable amount includes an amount that reasonably compensates the holder for the early termination of the instrument, the contractual cash flows could be payments of principal and interest on the principal amount outstanding. (See also paragraph AG74.)

AG77. In some cases a financial asset may have contractual cash flows that are described as principal and interest but those cash flows do not represent the payment of principal and interest on the principal amount outstanding as described in paragraphs 40(b), 41(b) and 42 of this Standard.

AG78. This may be the case if the financial asset represents an investment in particular assets or cash flows and hence the contractual cash flows are not solely payments of principal and interest on the principal amount outstanding. For example, if the contractual terms stipulate that the financial asset's cash flows increase as more automobiles use a particular toll road, those contractual cash flows are inconsistent with a basic lending arrangement. As a result, the instrument would not satisfy the condition in paragraphs 40(b) and 41(b). This could be the case when a creditor's claim is limited to specified assets of the debtor or the cash flows from specified assets (for example, a 'non-recourse' financial asset).

AG79. However, the fact that a financial asset is non-recourse does not in itself necessarily preclude the financial asset from meeting the condition in paragraphs 40(b) and 41(b). In such situations, the creditor is required to assess ('look through to') the particular underlying assets or cash flows to determine whether the contractual cash flows of the financial asset being classified are payments of principal and interest on the principal amount outstanding. If the terms of the financial asset give rise to any other cash flows or limit the cash flows in a manner inconsistent with payments representing principal and interest, the financial asset does not meet the condition in paragraphs 40(b) and 41(b). Whether the underlying assets are financial assets or non-financial assets does not in itself affect this assessment.

AG80. A contractual cash flow characteristic does not affect the classification of the financial asset if it could have only a de minimis effect on the contractual cash flows of the financial asset. To make this determination, an entity must consider the possible effect of the contractual cash flow characteristic in each reporting period and cumulatively over the life of the financial instrument. In addition, if a contractual cash flow characteristic could have an effect on the contractual cash flows that is more than de minimis (either in a single reporting period or cumulatively) but that cash flow characteristic is not genuine, it does not affect the classification of a financial asset. A cash flow characteristic is not genuine if it affects the instrument's contractual cash flows only on the occurrence of an event that is extremely rare, highly abnormal and very unlikely to occur.

AG81. In almost every lending transaction the creditor's instrument is ranked relative to the instruments of the debtor's other creditors. An instrument that is subordinated to other instruments may have contractual cash flows that are payments of principal and interest on the principal amount outstanding if the debtor's non-payment is a breach of contract and the holder has a contractual right to unpaid amounts of principal and interest on the principal amount outstanding even in the event of the debtor's bankruptcy. For example, a trade receivable that ranks its creditor as a general creditor would qualify as having payments of principal and interest on the principal amount outstanding. This is the case even if the debtor issued loans that are collateralized, which in the event of bankruptcy would give that loan holder priority over the claims of the general creditor in respect of the collateral but does not affect the contractual right of the general creditor to unpaid principal and other amounts due.

Contractually Linked Instruments

AG82. In some types of transactions, an issuer may prioritize payments to the holders of financial assets using multiple contractually linked instruments that create concentrations of credit risk (tranches). Each tranche has a subordination ranking that specifies the order in which any cash flows generated by the issuer are allocated to the tranche. In such situations, the holders of a tranche have the right to payments of principal and interest on the principal amount outstanding only if the issuer generates sufficient cash flows to satisfy higher-ranking tranches.

AG83. In such transactions, a tranche has cash flow characteristics that are payments of principal and interest on the principal amount outstanding only if:

(a) The contractual terms of the tranche being assessed for classification (without looking through to the underlying pool of financial instruments) give rise to cash flows that are solely payments of principal

and interest on the principal amount outstanding (e.g., the interest rate on the tranche is not linked to a commodity index);

(b) The underlying pool of financial instruments has the cash flow characteristics set out in paragraphs AG85 and AG86; and

(c) The exposure to credit risk in the underlying pool of financial instruments inherent in the tranche is equal to or lower than the exposure to credit risk of the underlying pool of financial instruments (for example, the credit rating of the tranche being assessed for classification is equal to or higher than the credit rating that would apply to a single tranche that funded the underlying pool of financial instruments).

AG84. An entity must look through until it can identify the underlying pool of instruments that are creating (instead of passing through) the cash flows. This is the underlying pool of financial instruments.

AG85. The underlying pool must contain one or more instruments that have contractual cash flows that are solely payments of principal and interest on the principal amount outstanding.

AG86. The underlying pool of instruments may also include instruments that:

(a) Reduce the cash flow variability of the instruments in paragraph AG85 and, when combined with the instruments in paragraph AG85, result in cash flows that are solely payments of principal and interest on the principal amount outstanding (e.g., an interest rate cap or floor or a contract that reduces the credit risk on some or all of the instruments in paragraph AG85); or

(b) Align the cash flows of the tranches with the cash flows of the pool of underlying instruments in paragraph AG85 to address differences in and only in:

(i) Whether the interest rate is fixed or floating;

(ii) The currency in which the cash flows are denominated, including inflation in that currency; or

(iii) The timing of the cash flows.

AG87. If any instrument in the pool does not meet the conditions in either paragraph AG85 or paragraph AG86, the condition in paragraph AG83(b) is not met. In performing this assessment, a detailed instrument-by-instrument analysis of the pool may not be necessary. However, an entity must use judgment and perform sufficient analysis to determine whether the instruments in the pool meet the conditions in paragraphs AG85–AG86. (See also paragraph AG80 for guidance on contractual cash flow characteristics that have only a de minimis effect.)

AG88. If the holder cannot assess the conditions in paragraph AG83 at initial recognition, the tranche must be measured at fair value through surplus or deficit. If the underlying pool of instruments can change after initial recognition in such a way that the pool may not meet the conditions in paragraphs AG85–AG86, the tranche does not meet the conditions in paragraph AG83 and must be measured at fair value through surplus or deficit. However, if the underlying pool includes instruments that are collateralized by assets that do not meet the conditions in paragraphs AG85–AG86, the ability to take possession of such assets shall be disregarded for the purposes of applying this paragraph unless the entity acquired the tranche with the management model of controlling the collateral.

Option to Designate a Financial Asset or Financial Liability as at Fair Value through Surplus or Deficit

AG89. Subject to the conditions in paragraphs 44 and 46, this Standard allows an entity to designate a financial asset, a financial liability, or a group of financial instruments (financial assets, financial liabilities or both) as at fair value through surplus or deficit provided that doing so results in more relevant information.

AG90. The decision of an entity to designate a financial asset or financial liability as at fair value through surplus or deficit is similar to an accounting policy choice (although, unlike an accounting policy choice, it is not required to be applied consistently to all similar transactions). When an entity has such a choice, paragraph 12 of IPSAS 3 requires the chosen policy to result in the financial statements providing faithfully representative and more relevant information about the effects of transactions, other events and conditions on the entity's financial position, financial performance or cash flows. For example, in the case of designation of a financial liability as at fair value through surplus or deficit, paragraph 46 sets out the two circumstances when the requirement for more relevant information will be met. Accordingly, to choose such designation in accordance with paragraph 46, the entity needs to demonstrate that it falls within one (or both) of these two circumstances.

Designation Eliminates or Significantly Reduces an Accounting Mismatch

AG91. Measurement of a financial asset or financial liability and classification of recognized changes in its value are determined by the item's classification and whether the item is part of a designated hedging relationship. Those requirements can create a measurement or recognition inconsistency (sometimes referred to as an 'accounting mismatch') when, for example, in the absence of designation as at fair value through surplus or deficit, a financial asset would be classified as subsequently measured at fair value through surplus or deficit and a liability the entity considers related would be subsequently measured at amortized cost (with changes in fair value not recognized). In such circumstances, an entity may conclude that its financial statements would provide more relevant information if both the asset and the liability were measured as at fair value through surplus or deficit.

AG92. The following examples show when this condition could be met. In all cases, an entity may use this condition to designate financial assets or financial liabilities as at fair value through surplus or deficit only if it meets the principle in paragraph 44 or 46(a):

(a) An entity has liabilities under insurance contracts whose measurement incorporates current information and financial assets that it considers to be related and that would otherwise be measured at either fair value through net assets/equity or amortized cost.

(b) An entity has financial assets, financial liabilities or both that share a risk, such as interest rate risk, and that gives rise to opposite changes in fair value that tend to offset each other. However, only some of the instruments would be measured at fair value through surplus or deficit (for example, those that are derivatives, or are classified as held for trading). It may also be the case that the requirements for hedge accounting are not met because, for example, the requirements for hedge effectiveness in paragraph 129 are not met.

(c) An entity has financial assets, financial liabilities or both that share a risk, such as interest rate risk, that gives rise to opposite changes in fair value that tend to offset each other and none of the financial assets or financial liabilities qualifies for designation as a hedging instrument because they are not measured at fair value through surplus or deficit. Furthermore, in the absence of hedge accounting there is a significant inconsistency in the recognition of gains and losses. For example, the entity has financed a specified group of loans by issuing traded bonds whose changes in fair value tend to offset each other. If, in addition, the entity regularly buys and sells the bonds but rarely, if ever, buys and sells the loans, reporting both the loans and the bonds at fair value through surplus or deficit eliminates the inconsistency in the timing of the recognition of the gains and losses that would otherwise result from measuring them both at amortized cost and recognizing a gain or loss each time a bond is repurchased.

AG93. In cases such as those described in the preceding paragraph, to designate, at initial recognition, the financial assets and financial liabilities not otherwise so measured as at fair value through surplus or deficit may

eliminate or significantly reduce the measurement or recognition inconsistency and produce more relevant information. For practical purposes, the entity need not enter into all of the assets and liabilities giving rise to the measurement or recognition inconsistency at exactly the same time. A reasonable delay is permitted provided that each transaction is designated as at fair value through surplus or deficit at its initial recognition and, at that time, any remaining transactions are expected to occur.

AG94. It would not be acceptable to designate only some of the financial assets and financial liabilities giving rise to the inconsistency as at fair value through surplus or deficit if to do so would not eliminate or significantly reduce the inconsistency and would therefore not result in more relevant information. However, it would be acceptable to designate only some of a number of similar financial assets or similar financial liabilities if doing so achieves a significant reduction (and possibly a greater reduction than other allowable designations) in the inconsistency. For example, assume an entity has a number of similar financial liabilities that sum to CU100 and a number of similar financial assets that sum to CU50 but are measured on a different basis. The entity may significantly reduce the measurement inconsistency by designating at initial recognition all of the assets but only some of the liabilities (for example, individual liabilities with a combined total of CU45) as at fair value through surplus or deficit. However, because designation as at fair value through surplus or deficit can be applied only to the whole of a financial instrument, the entity in this example must designate one or more liabilities in their entirety. It could not designate either a component of a liability (e.g., changes in value attributable to only one risk, such as changes in a benchmark interest rate) or a proportion (i.e., percentage) of a liability.

A Group of Financial Liabilities or Financial Assets and Financial Liabilities is Managed and its Performance is Evaluated on a Fair Value Basis

AG95. An entity may manage and evaluate the performance of a group of financial liabilities or financial assets and financial liabilities in such a way that measuring that group at fair value through surplus or deficit results in more relevant information. The focus in this instance is on the way the entity manages and evaluates performance, instead of on the nature of its financial instruments.

AG96. For example, an entity may use this condition to designate financial liabilities as at fair value through surplus or deficit if it meets the principle in paragraph 46(b) and the entity has financial assets and financial liabilities that share one or more risks and those risks are managed and evaluated on a fair value basis in accordance with a documented policy of asset and liability management. An example could be an entity that has issued ‘structured products’ containing multiple embedded derivatives and manages the resulting risks on a fair value basis using a mix of derivative and non-derivative financial instruments.

AG97. As noted above, this condition relies on the way the entity manages and evaluates performance of the group of financial instruments under consideration. Accordingly, (subject to the requirement of designation at initial recognition) an entity that designates financial liabilities as at fair value through surplus or deficit on the basis of this condition shall so designate all eligible financial liabilities that are managed and evaluated together.

AG98. Documentation of the entity’s strategy need not be extensive but should be sufficient to demonstrate compliance with paragraph 46(b). Such documentation is not required for each individual item, but may be on a portfolio basis. For example, if the performance management system for a department—as approved by the entity’s key management personnel—clearly demonstrates that its performance is evaluated on this basis, no further documentation is required to demonstrate compliance with paragraph 46(b).

Embedded Derivatives

AG99. When an entity becomes a party to a hybrid contract with a host that is not an asset within the scope of this Standard, paragraph 49 requires the entity to identify any embedded derivative, assess whether it is required to be separated from the host contract and, for those that are required to be separated, measure the derivatives at fair value at initial recognition and subsequently at fair value through surplus or deficit.

AG100. If a host contract has no stated or predetermined maturity and represents a residual interest in the net assets of an entity, then its economic characteristics and risks are those of an equity instrument, and an embedded derivative would need to possess equity characteristics related to the same entity to be regarded as closely related. If the host contract is not an equity instrument and meets the definition of a financial instrument, then its economic characteristics and risks are those of a debt instrument.

AG101. An embedded non-option derivative (such as an embedded forward or swap) is separated from its host contract on the basis of its stated or implied substantive terms, so as to result in it having a fair value of zero at initial recognition. An embedded option-based derivative (such as an embedded put, call, cap, floor or swaption) is separated from its host contract on the basis of the stated terms of the option feature. The initial carrying amount of the host instrument is the residual amount after separating the embedded derivative.

AG102. Generally, multiple embedded derivatives in a single hybrid contract are treated as a single compound embedded derivative. However, embedded derivatives that are classified as equity (see IPSAS 28) are accounted for separately from those classified as assets or liabilities. In addition, if a hybrid contract has more than one embedded derivative and those derivatives relate to different risk exposures and are readily separable and independent of each other, they are accounted for separately from each other.

AG103. The economic characteristics and risks of an embedded derivative are not closely related to the host contract (paragraph 49(a)) in the following examples. In these examples, assuming the conditions in paragraph 49(b) and 49(c) are met, an entity accounts for the embedded derivative separately from the host contract.

(a) A put option embedded in an instrument that enables the holder to require the issuer to reacquire the instrument for an amount of cash or other assets that varies on the basis of the change in an equity or commodity price or index is not closely related to a host debt instrument.

(b) An option or automatic provision to extend the remaining term to maturity of a debt instrument is not closely related to the host debt instrument unless there is a concurrent adjustment to the approximate current market rate of interest at the time of the extension. If an entity issues a debt instrument and the holder of that debt instrument writes a call option on the debt instrument to a third party, the issuer regards the call option as extending the term to maturity of the debt instrument provided the issuer can be required to participate in or facilitate the remarketing of the debt instrument as a result of the call option being exercised.

(c) Equity-indexed interest or principal payments embedded in a host debt instrument or insurance contract—by which the amount of interest or principal is indexed to the value of equity instruments—are not closely related to the host instrument because the risks inherent in the host and the embedded derivative are dissimilar.

(d) Commodity-indexed interest or principal payments embedded in a host debt instrument or insurance contract—by which the amount of interest or principal is indexed to the price of a commodity (such as gold)—are not closely related to the host instrument because the risks inherent in the host and the embedded derivative are dissimilar.

(e) A call, put, or prepayment option embedded in a host debt contract or host insurance contract is not closely related to the host contract unless:

(i) The option’s exercise price is approximately equal on each exercise date to the amortized cost of the host debt instrument or the carrying amount of the host insurance contract; or

(ii) The exercise price of a prepayment option reimburses the lender for an amount up to the approximate present value of lost interest for the remaining term of the host contract. Lost interest is the product of the principal amount prepaid multiplied by the interest rate differential. The interest rate differential is the excess of the effective interest rate of the host contract over

the effective interest rate the entity would receive at the prepayment date if it reinvested the principal amount prepaid in a similar contract for the remaining term of the host contract.

The assessment of whether the call or put option is closely related to the host debt contract is made before separating the equity element of a convertible debt instrument in accordance with IPSAS 28.

(f) Credit derivatives that are embedded in a host debt instrument and allow one party (the 'beneficiary') to transfer the credit risk of a particular reference asset, which it may not own, to another party (the 'guarantor') are not closely related to the host debt instrument. Such credit derivatives allow the guarantor to assume the credit risk associated with the reference asset without directly owning it.

AG104. An example of a hybrid contract is a financial instrument that gives the holder a right to put the financial instrument back to the issuer in exchange for an amount of cash or other financial assets that varies on the basis of the change in an equity or commodity index that may increase or decrease (a 'puttable instrument'). Unless the issuer on initial recognition designates the puttable instrument as a financial liability at fair value through surplus or deficit, it is required to separate an embedded derivative (i.e., the indexed principal payment) under paragraph 49 because the host contract is a debt instrument under paragraph AG100 and the indexed principal payment is not closely related to a host debt instrument under paragraph AG103(a). Because the principal payment can increase and decrease, the embedded derivative is a non-option derivative whose value is indexed to the underlying variable.

AG105. In the case of a puttable instrument that can be put back at any time for cash equal to a proportionate share of the net asset value of an entity (such as units of an open-ended mutual fund or some unit-linked investment products), the effect of separating an embedded derivative and accounting for each component is to measure the hybrid contract at the redemption amount that is payable at the end of the reporting period if the holder exercised its right to put the instrument back to the issuer.

AG106. The economic characteristics and risks of an embedded derivative are closely related to the economic characteristics and risks of the host contract in the following examples. In these examples, an entity does not account for the embedded derivative separately from the host contract.

(a) An embedded derivative in which the underlying is an interest rate or interest rate index that can change the amount of interest that would otherwise be paid or received on an interest-bearing host debt contract or insurance contract is closely related to the host contract unless the hybrid contract can be settled in such a way that the holder would not recover substantially all of its recognized investment or the embedded derivative could at least double the holder's initial rate of return on the host contract and could result in a rate of return that is at least twice what the market return would be for a contract with the same terms as the host contract.

(b) An embedded floor or cap on the interest rate on a debt contract or insurance contract is closely related to the host contract, provided the cap is at or above the market rate of interest and the floor is at or below the market rate of interest when the contract is issued, and the cap or floor is not leveraged in relation to the host contract. Similarly, provisions included in a contract to purchase or sell an asset (e.g., a commodity) that establish a cap and a floor on the price to be paid or received for the asset are closely related to the host contract if both the cap and floor were out of the money at inception and are not leveraged.

(c) An embedded foreign currency derivative that provides a stream of principal or interest payments that are denominated in a foreign currency and is embedded in a host debt instrument (for example, a dual currency bond) is closely related to the host debt instrument. Such a derivative is not separated from the host instrument because IPSAS 4, *The Effects of Changes in Foreign Exchange Rates* requires foreign currency gains and losses on monetary items to be recognized in surplus or deficit.

(d) An embedded foreign currency derivative in a host contract that is an insurance contract or not a financial instrument (such as a contract for the purchase or sale of a non-financial item where the price is denominated in a foreign currency) is closely related to the host contract provided it is not leveraged, does not contain an option feature, and requires payments denominated in one of the following currencies:

(i) The functional currency of any substantial party to that contract;

(ii) The currency in which the price of the related good or service that is acquired or delivered is routinely denominated in commercial transactions around the world (such as the US dollar for crude oil transactions); or

(iii) A currency that is commonly used in contracts to purchase or sell non-financial items in the economic environment in which the transaction takes place (e.g., a relatively stable and liquid currency that is commonly used in local business transactions or external trade).

(e) An embedded prepayment option in an interest-only or principal-only strip is closely related to the host contract provided the host contract (i) initially resulted from separating the right to receive contractual cash flows of a financial instrument that, in and of itself, did not contain an embedded derivative, and (ii) does not contain any terms not present in the original host debt contract.

(f) An embedded derivative in a host lease contract is closely related to the host contract if the embedded derivative is (i) an inflation-related index such as an index of lease payments to a consumer price index (provided that the lease is not leveraged and the index relates to inflation in the entity's own economic environment), (ii) variable lease payments based on related sales or (iii) variable lease payments based on variable interest rates.

(g) A unit-linking feature embedded in a host financial instrument or host insurance contract is closely related to the host instrument or host contract if the unit-denominated payments are measured at current unit values that reflect the fair values of the assets of the fund. A unit-linking feature is a contractual term that requires payments denominated in units of an internal or external investment fund.

(h) A derivative embedded in an insurance contract is closely related to the host insurance contract if the embedded derivative and host insurance contract are so interdependent that an entity cannot measure the embedded derivative separately (i.e., without considering the host contract).

Instruments Containing Embedded Derivatives

AG107. As noted in paragraph AG99, when an entity becomes a party to a hybrid contract with a host that is not an asset within the scope of this Standard and with one or more embedded derivatives, paragraph 49 requires the entity to identify any such embedded derivative, assess whether it is required to be separated from the host contract and, for those that are required to be separated, measure the derivatives at fair value at initial recognition and subsequently. These requirements can be more complex, or result in less reliable measures, than measuring the entire instrument at fair value through surplus or deficit. For that reason this Standard permits the entire hybrid contract to be designated as at fair value through surplus or deficit.

AG108. Such designation may be used whether paragraph 49 requires the embedded derivatives to be separated from the host contract or prohibits such separation. However, paragraph 51 would not justify designating the hybrid contract as at fair value through surplus or deficit in the cases set out in paragraph 51(a) and 51(b) because doing so would not reduce complexity or increase reliability.

Reassessment of Embedded Derivatives

AG109. In accordance with paragraph 49, an entity shall assess whether an embedded derivative is required to be separated from the host contract and accounted for as a derivative when the entity first becomes a party to the contract. Subsequent reassessment is prohibited unless there is a change in the terms of the contract that significantly modifies the cash flows that otherwise would be required under the contract, in which case reassessment is required. An entity determines whether a modification to cash flows is significant by considering the extent to which the expected future cash flows associated with the embedded derivative, the host contract or both have changed and whether the change is significant relative to the previously expected cash flows on the contract.

AG110. Paragraph AG109 does not apply to embedded derivatives in contracts acquired in:

(a) A public sector combination;

(b) A combination of entities under common control; or

(c) The formation of a joint venture as defined in IPSAS 37, Joint Arrangements

or their possible reassessment at the date of acquisition.

Reclassification of Financial Assets

Reclassification of Financial Assets

AG111. Paragraph 54 requires an entity to reclassify financial assets if the entity changes its management model for managing those financial assets. Such changes are expected to be very infrequent. Such changes are determined by the entity's senior management as a result of external or internal changes and must be significant to the entity's operations and demonstrable to external parties. Accordingly, a change in an entity's management model will occur only when an entity either begins or ceases to perform an activity that is significant to its operations; for example, when the entity has acquired, disposed of or terminated a business line. Examples of a change in management model include the following:

(a) A government agency extends loans to small business owners and has a management model to sell the loan portfolios to private entities at a discount due to the long collection cycle of these loans. The entity enters into a long term contract with a third party collection service provider. The loan portfolios are no longer for sale, as they are held to collect the contractual cash flows with the aid of the collections service provider.

(b) A department of government decides to end its support for its national auto manufacturing industry by no longer providing favorable loans. That department no longer issues new loans and the department is actively marketing its loan portfolio for sale.

AG112. A change in the objective of the entity's management model must be effected before the reclassification date. For example, if a federal mortgage and housing corporation decides on February 15 to shut down its retail mortgage business and hence must reclassify all affected financial assets on April 1 (i.e., the first day of the entity's next reporting period), the entity must not accept new retail mortgage business or otherwise engage in activities consistent with its former management model after February 15.

AG113. The following are not changes in management model:

(a) A change in intention related to particular financial assets (even in circumstances of significant changes in market conditions).

(b) The temporary disappearance of a particular market for financial assets.

(c) A transfer of financial assets between parts of the entity with different management models.

Measurement

Revenue Transactions

AG114. The initial recognition and measurement of assets and liabilities resulting from revenue transactions is dealt with in IPSAS 47. Assets resulting from revenue transactions can arise out of both contractual and non-contractual arrangements (see IPSAS 28 paragraphs AG20 and AG21). Where these assets arise out of contractual arrangements and otherwise meet the definition of a financial instrument, they are:

(a) Initially recognized in accordance with IPSAS 47;

(b) Initially measured:

(i) At the transaction consideration using the principles in IPSAS 47; and

(ii) Taking account of transaction costs that are directly attributable to the acquisition of the financial asset in accordance with paragraph 57 of this Standard, where the asset is subsequently measured other than at fair value through surplus or deficit.

Initial measurement

Initial Measurement of Financial Assets and Financial Liabilities (Paragraphs 57–59)

AG115. The fair value of a financial instrument at initial recognition is normally the transaction price (i.e., the fair value of the consideration given or received, see also paragraph AG117 and IPSAS 46). However, if part of the consideration given or received is for something other than the financial instrument, an entity shall measure the fair value of the financial instrument. For example, the fair value of a long-term loan or receivable that carries no interest can be measured as the present value of all future cash receipts discounted using the prevailing market rate(s) of interest for a similar instrument (similar as to currency, term, type of interest rate and other factors) with a similar credit rating. Any additional amount lent is an expense or a reduction of revenue unless it qualifies for recognition as some other type of asset.

AG116. If an entity originates a loan that bears an off-market interest rate (e.g., 5 percent when the market rate for similar loans is 8 percent), and receives an upfront fee as compensation, the entity recognizes the loan at its fair value, i.e., net of the fee it receives.

AG117. The best evidence of the fair value of a financial instrument at initial recognition is normally the transaction price (i.e., the fair value of the consideration given or received, see also IPSAS 46). If an entity determines that the fair value at initial recognition differs from the transaction price as mentioned in paragraph 58, the entity shall account for that instrument at that date as follows:

(a) At the measurement required by paragraph 57 if that fair value is evidenced by a quoted price in an active market for an identical asset or liability (i.e., a Level 1 input) or based on a measurement technique that uses only data from observable markets. An entity shall recognize the difference between the fair value at initial recognition and the transaction price as a gain or loss.

(b) In all other cases, at the measurement required by paragraph 57, adjusted to defer the difference between the fair value at initial recognition and the transaction price. After initial recognition, the entity shall recognize that deferred difference as a gain or loss only to the extent that it arises from a change in a factor (including time) that market participants would take into account when pricing the asset or liability.

The requirements of this paragraph do not apply to concessionary loans or equity instruments arising from non-exchange transactions as outlined in paragraphs AG118 to AG130.

Concessionary Loans

AG118. Concessionary loans are granted to or received by an entity at below market terms. Below market terms can result from interest and/or principal concessions. Examples of concessionary loans that commonly have below market terms include loans to developing countries, small farms, student loans granted to qualifying students for university or college education and housing loans granted to low income families. Entities may receive concessionary loans, for example, from development agencies and other government entities.

AG119. The granting or receiving of a concessionary loan is distinguished from the waiver of debt owing to or by an entity. This distinction is important because it affects whether the below market conditions are considered in the initial recognition or measurement of the loan rather than as part of the subsequent measurement or derecognition.

AG120. The intention of a concessionary loan at the outset is to provide or receive resources at below market terms. A waiver of debt results from loans initially granted or received at market related terms where the intention of either party to the loan has changed subsequent to its initial issue or receipt. For example, a government may lend money to a not-for-profit entity with the intention that the loan be repaid in full on market terms. However, the government may subsequently write-off part of the loan. This is not a concessionary loan as the intention of the loan at the outset was to provide credit to an entity at market related rates. An entity would treat the subsequent write-off of the loan as a waiver of debt and apply the derecognition requirements of IPSAS 41 (see paragraphs 12–34).

AG121. Concessionary loans also share many characteristics with originated credit-impaired loans. Whether a loan is classified as concessionary or originated credit-impaired determines whether the difference between the transaction price and the fair value of the loan is recognized as a concession or as a credit loss in the statement of financial performance.

AG122. Whether a loan is concessionary or originated credit-impaired depends on its substance. An intention to incorporate a non-exchange component into the transaction, such as a transfer of resources, indicates the loan is concessionary. The non-exchange component is incorporated into the transaction by granting the loan at below market terms. By contrast, originated credit-impaired loans are loans where one or more events, that have a detrimental impact on the estimated future cash flows of the financial asset, have occurred.

AG123. As concessionary loans are granted or received at below market terms, the transaction price on initial recognition of the loan may not be its fair value. At initial recognition, an entity therefore analyzes the substance of the loan granted or received into its component parts, and accounts for those components using the principles in paragraphs AG124 and AG126 below.

AG124. An entity firstly assesses whether the substance of the concessionary loan is in fact a loan, a non-exchange transaction, a contribution from owners or a combination thereof, by applying the principles in IPSAS 28 and paragraphs AG152–AG153 of IPSAS 47. If an entity has determined that the transaction, or part of the transaction, is a loan, it assesses whether the transaction price represents the fair value of the loan on initial recognition. An entity determines the fair value of the loan by using the principles in paragraphs AG144–AG155. Where an entity cannot determine fair value by reference to an active market, it uses a measurement technique. Fair value using a measurement technique could be determined by discounting all future cash receipts using a market related rate of interest for a similar loan (see paragraph AG115).

AG125. Any difference between the fair value of the loan and the transaction price (the loan proceeds) is treated as follows:

(a) Where the loan is received by an entity, the difference is accounted for in accordance with IPSAS 47.

(b) Where the loan is granted by an entity, the difference is treated as an expense in surplus or deficit at initial recognition, except where the loan is a transaction with owners, in their capacity as owners. Where the loan is a transaction with owners in their capacity as owners, for example, where a controlling entity provides a concessionary loan to a controlled entity, the difference may represent a capital contribution, i.e., an investment in an entity, rather than an expense.

Illustrative Examples are provided in paragraphs IE296–IE299 of IPSAS 47 as well as paragraphs IE153–IE161 accompanying this Standard.

AG126. After evaluating the substance of the concessionary loan and measuring the loan component at fair value, an entity subsequently assesses the classification of concessionary loans in accordance with paragraphs 39–44 and measures concessionary loans in accordance with paragraphs 61–65.

AG127. In some circumstances a concessionary loan may be granted that is also originated credit-impaired. For example, a government may provide loans with concessionary terms on a recurring basis to a borrower that historically has not been able to repay in full. If the concessionary loan is credit-impaired, an entity measures the instrument at the fair value including the expected credit losses over the life of the instrument. An entity applies paragraph AG125(b) to account for the component parts and recognizes the credit losses and concessionary element in its entirety as a concession.

Equity Instruments Arising from Non-Exchange Transactions

AG128. In the public sector, equity investment can be used as a way for an entity to provide financing or subsidized funding to another public sector entity. In such a transaction, there is generally a lack of an active market for such investments (i.e., the equity instrument is unquoted), and there are no or minimal future cash flow expectations from the investment besides a potential redemption by the issuing entity. Cash is provided by the investing entity to the investee generally to further the investee's economic or social objectives. Examples of such investments could include membership shares in a development bank, or equity investment in another public sector entity that provides certain social programs or services (e.g., shelters, subsidized housing, small business assistance...etc.)

AG129. At initial recognition of such transactions, an entity shall analyze the substance of the arrangement and assess whether the intention at the outset is the provision or receipt of resources by way of a non-exchange transaction. To the extent that the transaction, or component of the transaction, is a non-exchange transaction, any assets or revenues arising from the transaction are accounted for in accordance with IPSAS 47. The entity providing the resources shall recognize the amount as an expense in surplus or deficit at initial recognition.

AG130. To the extent an equity instrument arises from the transaction, or component of the transaction, that is within the scope of this Standard, it is to be recognized initially at fair value in accordance with paragraph 57. The equity instrument is to be measured subsequently in accordance with paragraphs 61–63. If the instrument does not have an active market, the entity shall consider measurement techniques and inputs in paragraphs AG149–AG155 in determining its fair value.

Valuing Financial Guarantees Issued through a Non-Exchange Transaction

AG131. Only contractual financial guarantees (or guarantees that are in substance, contractual) are within the scope of this Standard (See paragraphs AG3 and AG4 of IPSAS 28). Non-contractual guarantees are not within the scope of this Standard as they do not meet the definition of a financial instrument. This Standard prescribes recognition and measurement requirements only for the issuer of financial guarantee contracts.

AG132. In paragraph 9, "financial guarantee contract" is defined as "a contract that requires the issuer to make specified payments to reimburse the holder for a loss it incurs because a specified debtor fails to make payment when due in accordance with the original or modified terms of a debt instrument." Under the

requirements of this Standard, financial guarantee contracts, like other financial assets and financial liabilities, are required to be initially recognized at fair value. Paragraphs 66–68 of this Standard provide commentary and guidance on determining fair value and this is complemented by Application Guidance in paragraphs AG144–AG155. Subsequent measurement for financial guarantee contracts is at the higher of the amount of the loss allowance determined in accordance with paragraphs 73–93 and the amount initially recognized less, when appropriate, the cumulative amount of revenue recognized in accordance with IPSAS 47.

AG133. In the public sector, guarantees are frequently provided by way of non-exchange transactions, i.e., at no or nominal consideration. This type of guarantee is provided generally to further the entity's economic and social objectives. Such purposes include supporting infrastructure projects, supporting corporate entities at times of economic distress, guaranteeing the bond issues of entities in other tiers of governments and the loans of employees to finance motor vehicles that are to be used for performance of their duties as employees. Where there is consideration for a financial guarantee, an entity should determine whether that consideration arises from an exchange transaction and whether the consideration represents a fair value. If the consideration does represent a fair value, entities should recognize the financial guarantee at the amount of the consideration. Subsequent measurement should be at the higher of the amount of the loss allowance determined in accordance with paragraphs 73–93 and the amount initially recognized, less, when appropriate, the cumulative amount of revenue recognized in accordance with IPSAS 47. Where the entity concludes that the consideration is not a fair value, an entity determines the carrying value at initial recognition in the same way as if no consideration had been paid.

AG134. At initial recognition, where no fee is charged or where the consideration is not fair value, an entity firstly considers whether there are quoted prices available in an active market for financial guarantee contracts directly equivalent to that entered into. Evidence of an active market includes recent arm's length market transactions between knowledgeable willing parties, and reference to the current fair value of another financial guarantee contract that is substantially the same as that provided at nil or nominal consideration by the issuer. The fact that a financial guarantee contract has been entered into at no consideration by the debtor to the issuer is not, of itself, conclusive evidence of the absence of an active market. Guarantees may be available from commercial issuers, but a public sector entity may agree to enter into a financial guarantee contract for a number of non-commercial reasons. For example, if a debtor is unable to afford a commercial fee, and initiation of a project in fulfillment of one of the entity's social or policy objectives would be put at risk unless a financial guarantee contract is issued, it may approach a public sector entity or government to issue a financial guarantee contract.

AG135. Where there is no active market for a directly equivalent guarantee contract; the entity considers whether a measurement technique other than observation of an active market is available and provides a reliable measure of fair value. Such a measurement technique may rely on mathematical models which consider financial risk. For example, National Government W guarantees a bond issue of Municipality X. As Municipality X has a government guarantee backing its bond issue, its bonds have a lower coupon than if they were not secured by a government guarantee. This is because the guarantee lowers the risk profile of the bonds for investors. The guarantee fee could be determined by using the credit spread between what the coupon rate would have been had the issue not been backed by a government guarantee and the rate with the guarantee in place. Where a fair value is obtainable either by observation of an active market or through another measurement technique, the entity recognizes the financial guarantee at that fair value in the statement of financial position and recognizes an expense of an equivalent amount in the statement of financial performance. When using a measurement technique that is not based on observation of an active market an entity needs to satisfy itself that the output of any model is reliable and understandable.

AG136. If no reliable measure of fair value can be determined, either by direct observation of an active market or through another measurement technique, an entity is required to measure the financial guarantee contract at the amount of the loss allowance determined in accordance with paragraphs 73 to 93.

Subsequent Measurement

AG137. If a financial instrument that was previously recognized as a financial asset is measured at fair value through surplus or deficit and its fair value decreases below zero, it is a financial liability measured in accordance with paragraph 45. However, hybrid contracts with hosts that are assets within the scope of this Standard are always measured in accordance with paragraph 48.

AG138. The following example illustrates the accounting for transaction costs on the initial and subsequent measurement of a financial asset measured at fair value with changes through net assets/equity in accordance with either paragraph 106 or 41. An entity acquires a financial asset for CU100 plus a purchase commission of CU2. Initially, the entity recognizes the asset at CU102. The reporting period ends one day later, when the quoted market price of the asset is CU100. If the asset were sold, a commission of CU3 would be paid. On that date, the entity measures the asset at CU100 (without regard to the possible commission on sale) and recognizes a loss of CU2 in net assets/equity. If the financial asset is measured at fair value through net assets/equity in accordance with paragraph 41, the transaction costs are amortized to surplus or deficit using the effective interest method.

AG139. The subsequent measurement of a financial asset or financial liability and the subsequent recognition of gains and losses described in paragraph AG117 shall be consistent with the requirements of this Standard.

Investments in Equity Instruments and Contracts on those Investments

AG140. All investments in equity instruments and contracts on those instruments must be measured at fair value. However, in limited circumstances, cost may be an appropriate estimate of fair value. That may be the case if insufficient more recent information is available to measure fair value, or if there is a wide range of possible fair value measurements and cost represents the best estimate of fair value within that range.

AG141. Indicators that cost might not be representative of fair value include:

(a) A significant change in the performance of the investee compared with budgets, plans or milestones.

(b) Changes in expectation that the investee's technical product milestones will be achieved.

(c) A significant change in the market for the investee's equity or its products or potential products.

(d) A significant change in the global economy or the economic environment in which the investee operates.

(e) A significant change in the performance of comparable entities, or in the valuations implied by the overall market.

(f) Internal matters of the investee such as fraud, commercial disputes, litigation, changes in management or strategy.

(g) Evidence from external transactions in the investee's equity, either by the investee (such as a fresh issue of equity), or by transfers of equity instruments between third parties.

AG142. The list in paragraph AG141 is not exhaustive. An entity shall use all information about the performance and operations of the investee that becomes available after the date of initial recognition. To the extent that any such relevant factors exist, they may indicate that cost might not be representative of fair value. In such cases, the entity must measure fair value.

AG143. Cost is never the best estimate of fair value for investments in quoted equity instruments (or contracts on quoted equity instruments).

Fair Value Measurement Considerations

Application to Liabilities and an Entity's Own Equity Instruments

General Principles

AG143A. A fair value measurement assumes that a financial or non-financial liability or an entity's own equity instrument (e.g., equity interests issued as consideration in a public sector combination) is transferred to a market participant at the measurement date. The transfer of a liability or an entity's own equity instrument assumes the following:

(a) A liability would remain outstanding and the market participant transferee would be required to fulfill the obligation. The liability would not be settled with the counterparty or otherwise extinguished on the measurement date; and

(b) An entity's own equity instrument would remain outstanding and the market participant transferee would take on the rights and responsibilities associated with the instrument. The instrument would not be cancelled or otherwise extinguished on the measurement date.

AG143B. Even when there is no observable market to provide pricing information about the transfer of a liability or an entity's own equity instrument (e.g., because contractual or other legal restrictions prevent the transfer of such items), there might be an observable market for such items if they are held by other parties as assets (e.g., a government bond or a call option on an entity's shares).

AG143C. In all cases, an entity shall maximize the use of relevant observable inputs and minimize the use of unobservable inputs to meet the objective of a fair value measurement, which is to estimate the price at which an orderly transaction to transfer the liability or equity instrument would take place between market participants at the measurement date under current market conditions.

Liabilities and Equity Instruments Held by Other Parties as Assets

AG143D. When a quoted price for the transfer of an identical or a similar liability or entity's own equity instrument is not available and the identical item is held by another party as an asset, an entity shall measure the fair value of the liability or equity instrument from the perspective of a market participant that holds the identical item as an asset at the measurement date.

AG143E. In such cases, an entity shall measure the fair value of the liability or equity instrument as follows:

(a) Using the quoted price in an active market for the identical item held by another party as an asset, if that price is available.

(b) If that price is not available, using other observable inputs, such as the quoted price in a market that is not active for the identical item held by another party as an asset.

(c) If the observable prices in (a) and (b) are not available, using another measurement technique, such as

(i) An *income approach* (e.g., a present value technique that takes into account the future cash flows that a market participant would expect to receive from holding the liability or equity instrument as an asset; see paragraphs 45 and C35); and

(ii) A *market approach* (e.g., using quoted prices for similar liabilities or equity instruments held by other parties as assets; see paragraphs 42, C31 and C32).

AG143F. An entity shall adjust the quoted price of a liability or an entity's own equity instrument held by another party as an asset only if there are factors specific to the asset that are not applicable to the fair value measurement of the liability or equity instrument. An entity shall ensure that the price of the asset does not reflect the effect of a restriction preventing the sale of that asset. Some factors that may indicate that the quoted price of the asset should be adjusted include the following:

(a) The quoted price for the asset relates to a similar (but not identical) liability or equity instrument held by another party as an asset. For example, the liability or equity instrument may have a particular characteristic (e.g., the credit quality of the issuer) that is different from that reflected in the fair value of the similar liability or equity instrument held as an asset; and

(b) The unit of account for the asset is not the same as for the liability or equity instrument. For example, for liabilities, in some cases the price for an asset reflects a combined price for a package comprising both the amounts due from the issuer and a third-party credit enhancement. If the unit of account for the liability is not for the combined package, the objective is to measure the fair value of the issuer's liability, not the fair value of the combined package. Thus, in such cases, the entity would adjust the observed price for the asset to exclude the effect of the third-party credit enhancement.

Liabilities and Equity Instruments not Held by Other Parties as Assets

AG143G. When a quoted price for the transfer of an identical or a similar liability or entity's own equity instrument is not available and the identical item is not held by another party as an asset, an entity shall measure the fair value of the liability or equity instrument using a measurement technique from the perspective of a market participant that owes the liability or has issued the claim on equity.

AG143H. For example, when applying a present value technique an entity might take into account either of the following:

(a) The future cash outflows that a market participant would expect to incur in fulfilling the obligation, including the compensation that a market participant would require for taking on the obligation (see paragraphs AG143X–AG143Z); or

(b) The amount that a market participant would receive to enter into or issue an identical liability or equity instrument, using the assumptions that market participants would use when pricing the identical item (e.g., having the same credit characteristics) in the principal (or most advantageous) market for issuing a liability or an equity instrument with the same contractual terms.

Non-Performance Risk

AG143I. The fair value of a liability reflects the effect of *non-performance risk*. Non-performance risk includes, but may not be limited to, an entity's own credit risk (as defined in IFRS 7 *Financial Instruments: Disclosures*). Non-performance risk is assumed to be the same before and after the transfer of the liability.

AG143J. When measuring the fair value of a liability, an entity shall take into account the effect of its credit risk (credit standing) and any other factors that might influence the likelihood that the obligation will or will not be fulfilled. That effect may differ depending on the liability, for example:

(a) Whether the liability is an obligation to deliver cash (a financial liability) or an obligation to deliver goods or services (a non-financial liability); and

(b) The terms of credit enhancements related to the liability, if any.

AG143K. The fair value of a liability reflects the effect of non-performance risk on the basis of its unit of account. The issuer of a liability issued with an inseparable third-party credit enhancement that is accounted for separately from the liability shall not include the effect of the credit enhancement (e.g., a third-party guarantee of debt) in the fair value measurement of the liability. If the credit enhancement is accounted for separately from the

liability, the issuer would take into account its own credit standing and not that of the third-party guarantor when measuring the fair value of the liability.

Restriction Preventing the Transfer of a Liability or an Entity's Own Equity Instrument

AG143L. When measuring the fair value of a liability or an entity's own equity instrument, an entity shall not include a separate input or an adjustment to other inputs relating to the existence of a restriction that prevents the transfer of the item. The effect of a restriction that prevents the transfer of a liability or an entity's own equity instrument is either implicitly or explicitly included in the other inputs to the fair value measurement.

AG143M. For example, at the transaction date, both the creditor and the obligor accepted the transaction price for the liability with full knowledge that the obligation includes a restriction that prevents its transfer. As a result of the restriction being included in the transaction price, a separate input or an adjustment to an existing input is not required at the transaction date to reflect the effect of the restriction on transfer. Similarly, a separate input or an adjustment to an existing input is not required at subsequent measurement dates to reflect the effect of the restriction on transfer.

Financial Liability with a Demand Feature

AG143N. The fair value of a financial liability with a demand feature (e.g., a demand deposit) is not less than the amount payable on demand, discounted from the first date that the amount could be required to be paid.

Application to Financial Assets and Financial Liabilities with Offsetting Positions in Market Risks or Counterparty Credit Risk

AG143O. An entity that holds a group of financial assets and financial liabilities is exposed to market risks (as defined in IFRS 7) and to the credit risk (as defined in IFRS 7) of each of the counterparties. If the entity manages that group of financial assets and financial liabilities on the basis of its net exposure to either market risks or credit risk, the entity is permitted to apply an exception to this IFRS for measuring fair value. That exception permits an entity to measure the fair value of a group of financial assets and financial liabilities on the basis of the price that would be received to sell a net long position (i.e., an asset) for a particular risk exposure or paid to transfer a net short position (i.e., a liability) for a particular risk exposure in an orderly transaction between market participants at the measurement date under current market conditions. Accordingly, an entity shall measure the fair value of the group of financial assets and financial liabilities consistently with how market participants would price the net risk exposure at the measurement date.

AG143P. An entity is permitted to use the exception in paragraph AG143O only if the entity does all the following:

(a) Manages the group of financial assets and financial liabilities on the basis of the entity's net exposure to a particular market risk (or risks) or to the credit risk of a particular counterparty in accordance with the entity's documented risk management or investment strategy;

(b) Provides information on that basis about the group of financial assets and financial liabilities to the entity's key management personnel, as defined in IPSAS 20, Related Party Disclosures; and

(c) Is required or has elected to measure those financial assets and financial liabilities at fair value in the statement of financial position at the end of each reporting period.

AG143Q. The exception in paragraph AG143O does not pertain to financial statement presentation. In some cases, the basis for the presentation of financial instruments in the statement of financial position differs from the basis for the measurement of financial instruments, for example, if an IPSAS does not require or permit financial instruments to be presented on a net basis. In such cases an entity may need to allocate the portfolio-level adjustments (see paragraphs AG143T–AG143W) to the individual assets or liabilities that make up the group of financial assets and financial liabilities managed on the basis of the entity's net risk exposure. An entity shall perform such allocations on a reasonable and consistent basis using a methodology appropriate in the circumstances.

AG143R. An entity shall make an accounting policy decision in accordance with IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors* to use the exception in paragraph AG143O. An entity that uses the exception shall apply that accounting policy, including its policy for allocating bid-ask adjustments (see paragraphs AG143T–AG143V) and credit adjustments (see paragraph AG143W), if applicable, consistently from period to period for a particular portfolio.

AG143S. The exception in paragraph AG143O applies only to financial assets, financial liabilities and other contracts within the scope of IPSAS 41, *Financial Instruments* (or IPSAS 29, *Financial Instruments: Recognition and Measurement*, if IPSAS 41 has not yet been adopted). The references to financial assets and financial liabilities in paragraphs AG143O–AG143R and AG143T–AG143W should be read as applying to all contracts within the scope of, and accounted for in accordance with, IPSAS 41 (or IPSAS 29, if IPSAS 41 has not yet been adopted), regardless of whether they meet the definitions of financial assets or financial liabilities in IPSAS 29, *Financial Instruments: Presentation*.

Exposure to Market Risks

AG143T. When using the exception in paragraph AG143O to measure the fair value of a group of financial assets and financial liabilities managed on the basis of the entity's net exposure to a particular market risk (or risks), the entity shall apply the price within the bid-ask spread that is most representative of fair value in the circumstances to the entity's net exposure to those market risks (see paragraphs AG143AA and AG143BB).

AG143U. When using the exception in paragraph AG143O, an entity shall ensure that the market risk (or risks) to which the entity is exposed within that group of financial assets and financial liabilities is substantially the same. For example, an entity would not combine the interest rate risk associated with a financial asset with the commodity price risk associated with a financial liability because doing so would not mitigate the entity's exposure to interest rate risk or commodity price risk. When using the exception in paragraph AG143O, any basis risk resulting from the market risk parameters not being identical shall be taken into account in the fair value measurement of the financial assets and financial liabilities within the group.

AG143V. Similarly, the duration of the entity's exposure to a particular market risk (or risks) arising from the financial assets and financial liabilities shall be substantially the same. For example, an entity that uses a 12-month futures contract against the cash flows associated with 12 months' worth of interest rate risk exposure on a five-year financial instrument within a group made up of only those financial assets and financial liabilities measures the fair value of the exposure to 12-month interest rate risk on a net basis and the remaining interest rate risk exposure (i.e., years 2–5) on a gross basis.

Exposure to the Credit Risk of a Particular Counterparty

AG143W. When using the exception in paragraph AG143O to measure the fair value of a group of financial assets and financial liabilities entered into with a particular counterparty, the entity shall include the effect of the entity's net exposure to the credit risk of that counterparty or the counterparty's net exposure to the credit risk of the entity in the fair value measurement when market participants would take into account any existing arrangements that mitigate credit risk exposure in the event of default (e.g., a master netting agreement with the counterparty or an agreement that requires the exchange of collateral on the basis of each party's net exposure to the credit risk of the other party). The fair value measurement shall reflect market participants' expectations about the likelihood that such an arrangement would be legally enforceable in the event of default.

Applying Present Value Techniques to Liabilities and an Entity's Own Equity Instruments not Held by Other Parties as Assets (paragraphs AG143G and AG143H)

AG143X. When using a present value technique to measure the fair value of a liability that is not held by another party as an asset (e.g., a decommissioning liability), an entity shall, among other things, estimate the future cash outflows that market participants would expect to incur in fulfilling the obligation. Those future cash outflows

shall include market participants' expectations about the costs of fulfilling the obligation and the compensation that a market participant would require for taking on the obligation. Such compensation includes the return that a market participant would require for the following:

(a) Undertaking the activity (i.e., the value of fulfilling the obligation; e.g., by using resources that could be used for other activities); and

(b) Assuming the risk associated with the obligation (i.e., a risk premium that reflects the risk that the actual cash outflows might differ from the expected cash outflows; see paragraph AG143Z).

AG143Y. For example, a non-financial liability does not contain a contractual rate of return and there is no observable market yield for that liability. In some cases, the components of the return that market participants would require will be indistinguishable from one another (e.g., when using the price a third party contractor would charge on a fixed fee basis). In other cases, an entity needs to estimate those components separately (e.g., when using the price a third party contractor would charge on a cost plus basis because the contractor in that case would not bear the risk of future changes in costs).

AG143Z. An entity can include a risk premium in the fair value measurement of a liability or an entity's own equity instrument that is not held by another party as an asset in one of the following ways:

(a) By adjusting the cash flows (i.e., as an increase in the amount of cash outflows); or

(b) By adjusting the rate used to discount the future cash flows to their present values (i.e., as a reduction in the discount rate).

An entity shall ensure that it does not double-count or omit adjustments for risk. For example, if the estimated cash flows are increased to take into account the compensation for assuming the risk associated with the obligation, the discount rate should not be adjusted to reflect that risk.

Inputs to Measurement Techniques

AG143AA. If an asset or a liability measured at fair value has a bid price and an ask price (e.g., an input from a dealer market), the price within the bid-ask spread that is most representative of fair value in the circumstances shall be used to measure fair value regardless of where the input is categorized within the fair value hierarchy (i.e., Level 1, 2 or 3; see paragraphs D59–D89 of IPSAS 46, *Measurement*). The use of bid prices for asset positions and ask prices for liability positions is permitted, but is not required.

AG143AB. IPSAS 46 does not preclude the use of mid-market pricing or other pricing conventions that are used by market participants as a practical expedient for fair value measurements within a bid-ask spread.

Amortized Cost Measurement

Effective Interest Method

AG156. In applying the effective interest method, an entity identifies fees that are an integral part of the effective interest rate of a financial instrument. The description of fees for financial services may not be indicative of the nature and substance of the services provided. Fees that are an integral part of the effective interest rate of a financial instrument are treated as an adjustment to the effective interest rate, unless the financial instrument is measured at fair value, with the change in fair value being recognized in surplus or deficit. In those cases, the fees are recognized as revenue or expense when the instrument is initially recognized.

AG157. Fees that are an integral part of the effective interest rate of a financial instrument include:

(a) Origination fees received by the entity relating to the creation or acquisition of a financial asset. Such fees may include compensation for activities such as evaluating the borrower's financial condition, evaluating and recording guarantees, collateral and other security arrangements, negotiating the terms of the instrument, preparing and processing documents and closing the transaction. These fees are an integral part of generating an involvement with the resulting financial instrument.

(b) Commitment fees received by the entity to originate a loan when the loan commitment is not measured in accordance with paragraph 45(a) and it is probable that the entity will enter into a specific lending arrangement. These fees are regarded as compensation for an ongoing involvement with the acquisition of a financial instrument. If the commitment expires without the entity making the loan, the fee is recognized as revenue on expiry.

(c) Origination fees paid on issuing financial liabilities measured at amortized cost. These fees are an integral part of generating an involvement with a financial liability. An entity distinguishes fees and costs that are an integral part of the effective interest rate for the financial liability from origination fees and transaction costs relating to the right to provide services, such as investment management services.

AG158. Fees that are not an integral part of the effective interest rate of a financial instrument and are accounted for in accordance with IPSAS 47 include:

(a) Fees charged for servicing a loan;

(b) Commitment fees to originate a loan when the loan commitment is not measured in accordance with paragraph 45(a) and it is unlikely that a specific lending arrangement will be entered into; and

(c) Loan syndication fees received by an entity that arranges a loan and retains no part of the loan package for itself (or retains a part at the same effective interest rate for comparable risk as other participants).

AG159. When applying the effective interest method, an entity generally amortizes any fees, points paid or received, transaction costs and other premiums or discounts that are included in the calculation of the effective interest rate over the expected life of the financial instrument. However, a shorter period is used if this is the period to which the fees, points paid or received, transaction costs, premiums or discounts relate. This will be the case when the variable to which the fees, points paid or received, transaction costs, premiums or discounts relate is repriced to market rates before the expected maturity of the financial instrument. In such a case, the appropriate amortization period is the period to the next such repricing date. For example, if a premium or discount on a floating-rate financial instrument reflects the interest that has accrued on that financial instrument since the interest was last paid, or changes in the market rates since the floating interest rate was

reset to the market rates, it will be amortized to the next date when the floating interest is reset to market rates. This is because the premium or discount relates to the period to the next interest reset date because, at that date, the variable to which the premium or discount relates (i.e., interest rates) is reset to the market rates. If, however, the premium or discount results from a change in the credit spread over the floating rate specified in the financial instrument, or other variables that are not reset to the market rates, it is amortized over the expected life of the financial instrument.

AG160. For floating-rate financial assets and floating-rate financial liabilities, periodic re-estimation of cash flows to reflect the movements in the market rates of interest alters the effective interest rate. If a floating-rate financial asset or a floating-rate financial liability is recognized initially at an amount equal to the principal receivable or payable on maturity, re-estimating the future interest payments normally has no significant effect on the carrying amount of the asset or the liability.

AG161. If an entity revises its estimates of payments or receipts (excluding modifications in accordance with paragraph 71 and changes in estimates of expected credit losses), it shall adjust the gross carrying amount of the financial asset or amortized cost of a financial liability (or group of financial instruments) to reflect actual and revised estimated contractual cash flows. The entity recalculates the gross carrying amount of the financial asset or amortized cost of the financial liability as the present value of the estimated future contractual cash flows that are discounted at the financial instrument's original effective interest rate (or credit-adjusted effective interest rate for purchased or originated credit-impaired financial assets) or, when applicable, the revised effective interest rate calculated in accordance with paragraph 139. The adjustment is recognized in surplus or deficit as revenue or expense.

AG162. In some cases a financial asset is considered credit-impaired at initial recognition because the credit risk is very high, and in the case of a purchase it is acquired at a deep discount. An entity is required to include the initial expected credit losses in the estimated cash flows when calculating the credit-adjusted effective interest rate for financial assets that are considered to be purchased or originated credit-impaired at initial recognition. However, this does not mean that a credit-adjusted effective interest rate should be applied solely because the financial asset has high credit risk at initial recognition.

Transaction Costs

AG163. Transaction costs include fees and commission paid to agents (including employees acting as selling agents), advisers, brokers and dealers, levies by regulatory agencies and security exchanges, and transfer taxes and duties. Transaction costs do not include debt premiums or discounts, financing costs or internal administrative or holding costs.

Write-off

AG164. Write-offs can relate to a financial asset in its entirety or to a portion of it. For example, an entity plans to enforce the collateral on a financial asset and expects to recover no more than 30 percent of the financial asset from the collateral. If the entity has no reasonable prospects of recovering any further cash flows from the financial asset, it should write off the remaining 70 percent of the financial asset.

Impairment

Collective and Individual Assessment Basis

AG165. In order to meet the objective of recognizing lifetime expected credit losses for significant increases in credit risk since initial recognition, it may be necessary to perform the assessment of significant increases in credit risk on a collective basis by considering information that is indicative of significant increases in credit risk on, for example, a group or sub-group of financial instruments. This is to ensure that an entity meets the objective

of recognizing lifetime expected credit losses when there are significant increases in credit risk, even if evidence of such significant increases in credit risk at the individual instrument level is not yet available.

AG166. Lifetime expected credit losses are generally expected to be recognized before a financial instrument becomes past due. Typically, credit risk increases significantly before a financial instrument becomes past due or other lagging borrower-specific factors (for example, a modification or restructuring) are observed. Consequently when reasonable and supportable information that is more forward-looking than past due information is available without undue cost or effort, it must be used to assess changes in credit risk.

AG167. However, depending on the nature of the financial instruments and the credit risk information available for particular groups of financial instruments, an entity may not be able to identify significant changes in credit risk for individual financial instruments before the financial instrument becomes past due. This may be the case for financial instruments such as student loans for which there is little or no updated credit risk information that is routinely obtained and monitored on an individual instrument until a borrower breaches the contractual terms. If changes in the credit risk for individual financial instruments are not captured before they become past due, a loss allowance based only on credit information at an individual financial instrument level would not faithfully represent the changes in credit risk since initial recognition.

AG168. In some circumstances an entity does not have reasonable and supportable information that is available without undue cost or effort to measure lifetime expected credit losses on an individual instrument basis. In that case, lifetime expected credit losses shall be recognized on a collective basis that considers comprehensive credit risk information. This comprehensive credit risk information must incorporate not only past due information but also all relevant credit information, including forward-looking macroeconomic information, in order to approximate the result of recognizing lifetime expected credit losses when there has been a significant increase in credit risk since initial recognition on an individual instrument level.

AG169. For the purpose of determining significant increases in credit risk and recognizing a loss allowance on a collective basis, an entity can group financial instruments on the basis of shared credit risk characteristics with the objective of facilitating an analysis that is designed to enable significant increases in credit risk to be identified on a timely basis. The entity should not obscure this information by grouping financial instruments with different risk characteristics. Examples of shared credit risk characteristics may include, but are not limited to, the:

(a) Instrument type;

(b) Credit risk ratings;

(c) Collateral type;

(d) Date of initial recognition;

(e) Remaining term to maturity;

(f) Industry;

(g) Geographical location of the borrower; and

(h) The value of collateral relative to the financial asset if it has an impact on the probability of a default occurring (for example, non-recourse loans in some jurisdictions or loan-to-value ratios).

AG170. Paragraph 76 requires that lifetime expected credit losses are recognized on all financial instruments for which there has been significant increases in credit risk since initial recognition. In order to meet this objective, if an entity is not able to group financial instruments for which the credit risk is considered to have increased significantly since initial recognition based on shared credit risk characteristics, the entity should recognize lifetime expected credit losses on a portion of the financial assets for which credit risk is deemed to have increased significantly. The aggregation of financial instruments to assess whether there are changes in

credit risk on a collective basis may change over time as new information becomes available on groups of, or individual, financial instruments.

Timing of Recognizing Lifetime Expected Credit Losses

AG171. The assessment of whether lifetime expected credit losses should be recognized is based on significant increases in the likelihood or risk of a default occurring since initial recognition (irrespective of whether a financial instrument has been repriced to reflect an increase in credit risk) instead of on evidence of a financial asset being credit-impaired at the reporting date or an actual default occurring. Generally, there will be a significant increase in credit risk before a financial asset becomes credit-impaired or an actual default occurs.

AG172. For loan commitments, an entity considers changes in the risk of a default occurring on the loan to which a loan commitment relates. For financial guarantee contracts, an entity considers the changes in the risk that the specified debtor will default on the contract.

AG173. The significance of a change in the credit risk since initial recognition depends on the risk of a default occurring as at initial recognition. Thus, a given change, in absolute terms, in the risk of a default occurring will be more significant for a financial instrument with a lower initial risk of a default occurring compared to a financial instrument with a higher initial risk of a default occurring.

AG174. The risk of a default occurring on financial instruments that have comparable credit risk is higher the longer the expected life of the instrument; for example, the risk of a default occurring on an AAA-rated bond with an expected life of 10 years is higher than that on an AAA-rated bond with an expected life of five years.

AG175. Because of the relationship between the expected life and the risk of a default occurring, the change in credit risk cannot be assessed simply by comparing the change in the absolute risk of a default occurring over time. For example, if the risk of a default occurring for a financial instrument with an expected life of 10 years at initial recognition is identical to the risk of a default occurring on that financial instrument when its expected life in a subsequent period is only five years, that may indicate an increase in credit risk. This is because the risk of a default occurring over the expected life usually decreases as time passes if the credit risk is unchanged and the financial instrument is closer to maturity. However, for financial instruments that only have significant payment obligations close to the maturity of the financial instrument the risk of a default occurring may not necessarily decrease as time passes. In such a case, an entity should also consider other qualitative factors that would demonstrate whether credit risk has increased significantly since initial recognition.

AG176. An entity may apply various approaches when assessing whether the credit risk on a financial instrument has increased significantly since initial recognition or when measuring expected credit losses. An entity may apply different approaches for different financial instruments. An approach that does not include an explicit probability of default as an input per se, such as a credit loss rate approach, can be consistent with the requirements in this Standard, provided that an entity is able to separate the changes in the risk of a default occurring from changes in other drivers of expected credit losses, such as collateral, and considers the following when making the assessment:

(a) The change in the risk of a default occurring since initial recognition;

(b) The expected life of the financial instrument; and

(c) Reasonable and supportable information that is available without undue cost or effort that may affect credit risk.

AG177. The methods used to determine whether credit risk has increased significantly on a financial instrument since initial recognition should consider the characteristics of the financial instrument (or group of financial instruments) and the default patterns in the past for comparable financial instruments. Despite the

requirement in paragraph 81, for financial instruments for which default patterns are not concentrated at a specific point during the expected life of the financial instrument, changes in the risk of a default occurring over the next 12 months may be a reasonable approximation of the changes in the lifetime risk of a default occurring. In such cases, an entity may use changes in the risk of a default occurring over the next 12 months to determine whether credit risk has increased significantly since initial recognition, unless circumstances indicate that a lifetime assessment is necessary.

AG178. However, for some financial instruments, or in some circumstances, it may not be appropriate to use changes in the risk of a default occurring over the next 12 months to determine whether lifetime expected credit losses should be recognized. For example, the change in the risk of a default occurring in the next 12 months may not be a suitable basis for determining whether credit risk has increased on a financial instrument with a maturity of more than 12 months when:

(a) The financial instrument only has significant payment obligations beyond the next 12 months;

(b) Changes in relevant macroeconomic or other credit-related factors occur that are not adequately reflected in the risk of a default occurring in the next 12 months; or

(c) Changes in credit-related factors only have an impact on the credit risk of the financial instrument (or have a more pronounced effect) beyond 12 months.

Determining Whether Credit Risk has Increased Significantly since Initial Recognition

AG179. When determining whether the recognition of lifetime expected credit losses is required, an entity shall consider reasonable and supportable information that is available without undue cost or effort and that may affect the credit risk on a financial instrument in accordance with paragraph 90(c). An entity need not undertake an exhaustive search for information when determining whether credit risk has increased significantly since initial recognition.

AG180. Credit risk analysis is a multifactor and holistic analysis; whether a specific factor is relevant, and its weight compared to other factors, will depend on the type of product, characteristics of the financial instruments and the borrower as well as the geographical region. An entity shall consider reasonable and supportable information that is available without undue cost or effort and that is relevant for the particular financial instrument being assessed. However, some factors or indicators may not be identifiable on an individual financial instrument level. In such a case, the factors or indicators should be assessed for appropriate portfolios, groups of portfolios or portions of a portfolio of financial instruments to determine whether the requirement in paragraph 75 for the recognition of lifetime expected credit losses has been met.

AG181. The following non-exhaustive list of information may be relevant in assessing changes in credit risk:

(a) Significant changes in internal price indicators of credit risk as a result of a change in credit risk since inception, including, but not limited to, the credit spread that would result if a particular financial instrument or similar financial instrument with the same terms and the same counterparty were newly originated or issued at the reporting date.

(b) Other changes in the rates or terms of an existing financial instrument that would be significantly different if the instrument was newly originated or issued at the reporting date (such as more stringent covenants, increased amounts of collateral or guarantees, or higher revenue coverage) because of changes in the credit risk of the financial instrument since initial recognition.

(c) Significant changes in external market indicators of credit risk for a particular financial instrument or similar financial instruments with the same expected life. Changes in market indicators of credit risk include, but are not limited to:

(i) The credit spread;

(ii) The credit default swap prices for the borrower;

(iii) The length of time or the extent to which the fair value of a financial asset has been less than its amortized cost; and

(iv) Other market information related to the borrower, such as changes in the price of a borrower's debt and equity instruments.

(d) An actual or expected significant change in the financial instrument's external credit rating.

(e) An actual or expected internal credit rating downgrade for the borrower or decrease in behavioral scoring used to assess credit risk internally. Internal credit ratings and internal behavioral scoring are more reliable when they are mapped to external ratings or supported by default studies.

(f) Existing or forecast adverse changes in business, financial or economic conditions that are expected to cause a significant change in the borrower's ability to meet its debt obligations, such as an actual or expected increase in interest rates or an actual or expected significant increase in unemployment rates.

(g) An actual or expected significant change in the operating results of the borrower. Examples include actual or expected declining revenues or margins, increasing operating risks, working capital deficiencies, decreasing asset quality, increased balance sheet leverage, liquidity, management problems or changes in the scope of operation or organizational structure (such as the discontinuance of a segment of the entity) that results in a significant change in the borrower's ability to meet its debt obligations.

(h) Significant increases in credit risk on other financial instruments of the same borrower.

(i) An actual or expected significant adverse change in the regulatory, economic, or technological environment of the borrower that results in a significant change in the borrower's ability to meet its debt obligations, such as a decline in the demand for the borrower's sales product because of a shift in technology.

(j) Significant changes in the value of the collateral supporting the obligation or in the quality of third-party guarantees or credit enhancements, which are expected to reduce the borrower's economic incentive to make scheduled contractual payments or to otherwise have an effect on the probability of a default occurring. For example, if the value of collateral declines because house prices decline, borrowers in some jurisdictions have a greater incentive to default on their mortgages.

(k) A significant change in the quality of the guarantee provided by an entity's owners (or an individual's guarantors) if the shareholder (or guarantors) have an incentive and financial ability to prevent default by capital or cash infusion.

(l) Significant changes, such as reductions in financial support from a controlling entity or other affiliate or an actual or expected significant change in the quality of credit enhancement, that are expected to reduce the borrower's economic incentive to make scheduled contractual payments. Credit quality enhancements or support include the consideration of the financial condition of the guarantor and/or, for interests issued in securitizations, whether subordinated interests are expected to be capable of absorbing expected credit losses (for example, on the loans underlying the security).

(m) Expected changes in the loan documentation including an expected breach of contract that may lead to covenant waivers or amendments, interest payment holidays, interest rate step-ups, requiring additional collateral or guarantees, or other changes to the contractual framework of the instrument.

(n) Significant changes in the expected performance and behavior of the borrower, including changes in the payment status of borrowers in the economic entity (for example, an increase in the expected number or extent of delayed contractual payments).

(o) Changes in the entity's credit management approach in relation to the financial instrument; i.e., based on emerging indicators of changes in the credit risk of the financial instrument, the entity's credit risk management practice is expected to become more active or to be focused on managing the instrument, including the instrument becoming more closely monitored or controlled, or the entity specifically intervening with the borrower.

(p) Past due information, including the rebuttable presumption as set out in paragraph 83.

AG182. In some cases, the qualitative and non-statistical quantitative information available may be sufficient to determine that a financial instrument has met the criterion for the recognition of a loss allowance at an amount equal to lifetime expected credit losses. That is, the information does not need to flow through a statistical model or credit ratings process in order to determine whether there has been a significant increase in the credit risk of the financial instrument. In other cases, an entity may need to consider other information, including information from its statistical models or credit ratings processes. Alternatively, the entity may base the assessment on both types of information, i.e., qualitative factors that are not captured through the internal ratings process and a specific internal rating category at the reporting date, taking into consideration the credit risk characteristics at initial recognition, if both types of information are relevant.

More than 30 Days Past Due Rebuttable Presumption

AG183. The rebuttable presumption in paragraph 83 is not an absolute indicator that lifetime expected credit losses should be recognized, but is presumed to be the latest point at which lifetime expected credit losses should be recognized even when using forward-looking information (including macroeconomic factors on a portfolio level).

AG184. An entity can rebut this presumption. However, it can do so only when it has reasonable and supportable information available that demonstrates that even if contractual payments become more than 30 days past due, this does not represent a significant increase in the credit risk of a financial instrument. For example when non-payment was an administrative oversight, instead of resulting from financial difficulty of the borrower, or the entity has access to historical evidence that demonstrates that there is no correlation between significant increases in the risk of a default occurring and financial assets on which payments are more than 30 days past due, but that evidence does identify such a correlation when payments are more than 60 days past due.

AG185. An entity cannot align the timing of significant increases in credit risk and the recognition of lifetime expected credit losses to when a financial asset is regarded as credit-impaired or an entity's internal definition of default.

Financial Instruments that have Low Credit Risk at the Reporting Date

AG186. The credit risk on a financial instrument is considered low for the purposes of paragraph 82, if the financial instrument has a low risk of default, the borrower has a strong capacity to meet its contractual cash flow obligations in the near term and adverse changes in economic and business conditions in the longer term may, but will not necessarily, reduce the ability of the borrower to fulfil its contractual cash flow obligations. Financial instruments are not considered to have low credit risk when they are regarded as having a low risk of loss simply because of the value of collateral and the financial instrument without that collateral would not be considered low credit risk. Financial instruments are also not considered to have low credit risk simply because they have a lower risk of default than the entity's other financial instruments or relative to the credit risk of the jurisdiction within which an entity operates.

AG187. To determine whether a financial instrument has low credit risk, an entity may use its internal credit risk ratings or other methodologies that are consistent with a globally understood definition of low credit risk and that consider the risks and the type of financial instruments that are being assessed. An external rating of

'investment grade' is an example of a financial instrument that may be considered as having low credit risk. However, financial instruments are not required to be externally rated to be considered to have low credit risk. They should, however, be considered to have low credit risk from a market participant perspective taking into account all of the terms and conditions of the financial instrument.

AG188. Lifetime expected credit losses are not recognized on a financial instrument simply because it was considered to have low credit risk in the previous reporting period and is not considered to have low credit risk at the reporting date. In such a case, an entity shall determine whether there has been a significant increase in credit risk since initial recognition and thus whether lifetime expected credit losses are required to be recognized in accordance with paragraph 75.

Modifications

AG189. In some circumstances, the renegotiation or modification of the contractual cash flows of a financial asset can lead to the derecognition of the existing financial asset in accordance with this Standard. When the modification of a financial asset results in the derecognition of the existing financial asset and the subsequent recognition of the modified financial asset, the modified asset is considered a 'new' financial asset for the purposes of this Standard.

AG190. Accordingly the date of the modification shall be treated as the date of initial recognition of that financial asset when applying the impairment requirements to the modified financial asset. This typically means measuring the loss allowance at an amount equal to 12-month expected credit losses until the requirements for the recognition of lifetime expected credit losses in paragraph 75 are met. However, in some unusual circumstances following a modification that results in derecognition of the original financial asset, there may be evidence that the modified financial asset is credit-impaired at initial recognition, and thus, the financial asset should be recognized as an originated credit-impaired financial asset. This might occur, for example, in a situation in which there was a substantial modification of a distressed asset that resulted in the derecognition of the original financial asset. In such a case, it may be possible for the modification to result in a new financial asset which is credit-impaired at initial recognition.

AG191. If the contractual cash flows on a financial asset have been renegotiated or otherwise modified, but the financial asset is not derecognized, that financial asset is not automatically considered to have lower credit risk. An entity shall assess whether there has been a significant increase in credit risk since initial recognition on the basis of all reasonable and supportable information that is available without undue cost or effort. This includes historical and forward-looking information and an assessment of the credit risk over the expected life of the financial asset, which includes information about the circumstances that led to the modification. Evidence that the criteria for the recognition of lifetime expected credit losses are no longer met may include a history of up-to-date and timely payment performance against the modified contractual terms. Typically a borrower would need to demonstrate consistently good payment behavior over a period of time before the credit risk is considered to have decreased. For example, a history of missed or incomplete payments would not typically be erased by simply making one payment on time following a modification of the contractual terms.

Measurement of Expected Credit Losses

Expected Credit Losses

AG192. Expected credit losses are a probability-weighted estimate of credit losses (i.e., the present value of all cash shortfalls) over the expected life of the financial instrument. A cash shortfall is the difference between the cash flows that are due to an entity in accordance with the contract and the cash flows that the entity expects to receive. Because expected credit losses consider the amount and timing of payments, a credit loss arises even if the entity expects to be paid in full but later than when contractually due.

AG193. For financial assets, a credit loss is the present value of the difference between:

(a) The contractual cash flows that are due to an entity under the contract; and

(b) The cash flows that the entity expects to receive.

AG194. For undrawn loan commitments, a credit loss is the present value of the difference between:

(a) The contractual cash flows that are due to the entity if the holder of the loan commitment draws down the loan; and

(b) The cash flows that the entity expects to receive if the loan is drawn down.

AG195. An entity's estimate of expected credit losses on loan commitments shall be consistent with its expectations of drawdowns on that loan commitment, i.e., it shall consider the expected portion of the loan commitment that will be drawn down within 12 months of the reporting date when estimating 12-month expected credit losses, and the expected portion of the loan commitment that will be drawn down over the expected life of the loan commitment when estimating lifetime expected credit losses.

AG196. For a financial guarantee contract, the entity is required to make payments only in the event of a default by the debtor in accordance with the terms of the instrument that is guaranteed. Accordingly, cash shortfalls are the expected payments to reimburse the holder for a credit loss that it incurs less any amounts that the entity expects to receive from the holder, the debtor or any other party. If the asset is fully guaranteed, the estimation of cash shortfalls for a financial guarantee contract would be consistent with the estimations of cash shortfalls for the asset subject to the guarantee.

AG197. For a financial asset that is credit-impaired at the reporting date, but that is not a purchased or originated credit-impaired financial asset, an entity shall measure the expected credit losses as the difference between the asset's gross carrying amount and the present value of estimated future cash flows discounted at the financial asset's original effective interest rate. Any adjustment is recognized in surplus or deficit as an impairment gain or loss.

AG198. When measuring a loss allowance for a lease receivable, the cash flows used for determining the expected credit losses should be consistent with the cash flows used in measuring the lease receivable in accordance with IPSAS 43, Leases.

AG199. An entity may use practical expedients when measuring expected credit losses if they are consistent with the principles in paragraph 90. An example of a practical expedient is the calculation of the expected credit losses on receivables using a provision matrix. The entity would use its historical credit loss experience (adjusted as appropriate in accordance with paragraphs AG215–AG216) for receivables to estimate the 12-month expected credit losses or the lifetime expected credit losses on the financial assets as relevant. A provision matrix might, for example, specify fixed provision rates depending on the number of days that a trade receivable is past due (for example, 1 percent if not past due, 2 percent if less than 30 days past due, 3 percent if more than 30 days but less than 90 days past due, 20 percent if 90-180 days past due etc.). Depending on the diversity of its customer base, the entity would use appropriate groupings if its historical credit loss experience shows significantly different loss patterns for different customer segments. Examples of criteria that might be used to group assets include geographical region, product type, customer rating, collateral or trade credit insurance and type of customer (such as other government entities or individuals).

Definition of Default

AG200. Paragraph 81 requires that when determining whether the credit risk on a financial instrument has increased significantly, an entity shall consider the change in the risk of a default occurring since initial recognition.

AG201. When defining default for the purposes of determining the risk of a default occurring, an entity shall apply a default definition that is consistent with the definition used for internal credit risk management purposes for

the relevant financial instrument and consider qualitative indicators (for example, financial covenants) when appropriate. However, there is a rebuttable presumption that default does not occur later than when a financial asset is 90 days past due unless an entity has reasonable and supportable information to demonstrate that a more lagging default criterion is more appropriate. The definition of default used for these purposes shall be applied consistently to all financial instruments unless information becomes available that demonstrates that another default definition is more appropriate for a particular financial instrument.

Period Over Which to Estimate Expected Credit Losses

AG202. In accordance with paragraph 92, the maximum period over which expected credit losses shall be measured is the maximum contractual period over which the entity is exposed to credit risk. For loan commitments and financial guarantee contracts, this is the maximum contractual period over which an entity has a present contractual obligation to extend credit.

AG203. However, in accordance with paragraph 93, some financial instruments include both a loan and an undrawn commitment component and the entity's contractual ability to demand repayment and cancel the undrawn commitment does not limit the entity's exposure to credit losses to the contractual notice period. For example, revolving credit facilities, such as line of credit provided by a government owned bank, can be contractually withdrawn by the lender with as little as one day's notice. However, in practice lenders continue to extend credit for a longer period and may only withdraw the facility after the credit risk of the borrower increases, which could be too late to prevent some or all of the expected credit losses. These financial instruments generally have the following characteristics as a result of the nature of the financial instrument, the way in which the financial instruments are managed, and the nature of the available information about significant increases in credit risk:

(a) The financial instruments do not have a fixed term or repayment structure and usually have a short contractual cancellation period (for example, one day);

(b) The contractual ability to cancel the contract is not enforced in the normal day-to-day management of the financial instrument and the contract may only be canceled when the entity becomes aware of an increase in credit risk at the facility level; and

(c) The financial instruments are managed on a collective basis.

AG204. When determining the period over which the entity is expected to be exposed to credit risk, but for which expected credit losses would not be mitigated by the entity's normal credit risk management actions, an entity should consider factors such as historical information and experience about:

(a) The period over which the entity was exposed to credit risk on similar financial instruments;

(b) The length of time for related defaults to occur on similar financial instruments following a significant increase in credit risk; and

(c) The credit risk management actions that an entity expects to take once the credit risk on the financial instrument has increased, such as the reduction or removal of undrawn limits.

Probability-weighted Outcome

AG205. The purpose of estimating expected credit losses is neither to estimate a worst-case scenario nor to estimate the best-case scenario. Instead, an estimate of expected credit losses shall always reflect the possibility that a credit loss occurs and the possibility that no credit loss occurs even if the most likely outcome is no credit loss.

AG206. Paragraph 90(a) requires the estimate of expected credit losses to reflect an unbiased and probability-weighted amount that is determined by evaluating a range of possible outcomes. In practice, this may not

need to be a complex analysis. In some cases, relatively simple modelling may be sufficient, without the need for a large number of detailed simulations of scenarios. For example, the average credit losses of a large group of financial instruments with shared risk characteristics may be a reasonable estimate of the probability-weighted amount. In other situations, the identification of scenarios that specify the amount and timing of the cash flows for particular outcomes and the estimated probability of those outcomes will probably be needed. In those situations, the expected credit losses shall reflect at least two outcomes in accordance with paragraph 91.

AG207. For lifetime expected credit losses, an entity shall estimate the risk of a default occurring on the financial instrument during its expected life. 12-month expected credit losses are a portion of the lifetime expected credit losses and represent the lifetime cash shortfalls that will result if a default occurs in the 12 months after the reporting date (or a shorter period if the expected life of a financial instrument is less than 12 months), weighted by the probability of that default occurring. Thus, 12-month expected credit losses are neither the lifetime expected credit losses that an entity will incur on financial instruments that it predicts will default in the next 12 months nor the cash shortfalls that are predicted over the next 12 months.

Time Value of Money

AG208. Expected credit losses shall be discounted to the reporting date, not to the expected default or some other date, using the effective interest rate determined at initial recognition or an approximation thereof. If a financial instrument has a variable interest rate, expected credit losses shall be discounted using the current effective interest rate determined in accordance with paragraph AG160.

AG209. For purchased or originated credit-impaired financial assets, expected credit losses shall be discounted using the credit-adjusted effective interest rate determined at initial recognition.

AG210. Expected credit losses on lease receivables shall be discounted using the same discount rate used in the measurement of the lease receivable in accordance with IPSAS 43, *Leases*.

AG211. The expected credit losses on a loan commitment shall be discounted using the effective interest rate, or an approximation thereof, that will be applied when recognizing the financial asset resulting from the loan commitment. This is because for the purpose of applying the impairment requirements, a financial asset that is recognized following a draw down on a loan commitment shall be treated as a continuation of that commitment instead of as a new financial instrument. The expected credit losses on the financial asset shall therefore be measured considering the initial credit risk of the loan commitment from the date that the entity became a party to the irrevocable commitment.

AG212. Expected credit losses on financial guarantee contracts or on loan commitments for which the effective interest rate cannot be determined shall be discounted by applying a discount rate that reflects the current market assessment of the time value of money and the risks that are specific to the cash flows but only if, and to the extent that, the risks are taken into account by adjusting the discount rate instead of adjusting the cash shortfalls being discounted.

Reasonable and Supportable Information

AG213. For the purpose of this Standard, reasonable and supportable information is that which is reasonably available at the reporting date without undue cost or effort, including information about past events, current conditions and forecasts of future economic conditions. Information that is available for financial reporting purposes is considered to be available without undue cost or effort.

AG214. An entity is not required to incorporate forecasts of future conditions over the entire expected life of a financial instrument. The degree of judgment that is required to estimate expected credit losses depends on the availability of detailed information. As the forecast horizon increases, the availability of detailed information decreases and the degree of judgment required to estimate expected credit losses increases. The estimate

of expected credit losses does not require a detailed estimate for periods that are far in the future—for such periods, an entity may extrapolate projections from available, detailed information.

AG215. An entity need not undertake an exhaustive search for information but shall consider all reasonable and supportable information that is available without undue cost or effort and that is relevant to the estimate of expected credit losses, including the effect of expected prepayments. The information used shall include factors that are specific to the borrower, general economic conditions and an assessment of both the current as well as the forecast direction of conditions at the reporting date. An entity may use various sources of data that may be both internal (entity-specific) and external. Possible data sources include internal historical credit loss experience, internal ratings, credit loss experience of other entities and external ratings, reports and statistics. Entities that have no, or insufficient, sources of entity-specific data may use peer group experience for the comparable financial instrument (or groups of financial instruments).

AG216. Historical information is an important anchor or base from which to measure expected credit losses. However, an entity shall adjust historical data, such as credit loss experience, on the basis of current observable data to reflect the effects of the current conditions and its forecasts of future conditions that did not affect the period on which the historical data is based, and to remove the effects of the conditions in the historical period that are not relevant to the future contractual cash flows. In some cases, the best reasonable and supportable information could be the unadjusted historical information, depending on the nature of the historical information and when it was calculated, compared to circumstances at the reporting date and the characteristics of the financial instrument being considered. Estimates of changes in expected credit losses should reflect, and be directionally consistent with, changes in related observable data from period to period (such as changes in unemployment rates, property prices, commodity prices, payment status or other factors that are indicative of credit losses on the financial instrument or in the group of financial instruments and in the magnitude of those changes). An entity shall regularly review the methodology and assumptions used for estimating expected credit losses to reduce any differences between estimates and actual credit loss experience.

AG217. When using historical credit loss experience in estimating expected credit losses, it is important that information about historical credit loss rates is applied to groups that are defined in a manner that is consistent with the groups for which the historical credit loss rates were observed. Consequently, the method used shall enable each group of financial assets to be associated with information about past credit loss experience in groups of financial assets with similar risk characteristics and with relevant observable data that reflects current conditions.

AG218. Expected credit losses reflect an entity’s own expectations of credit losses. However, when considering all reasonable and supportable information that is available without undue cost or effort in estimating expected credit losses, an entity should also consider observable market information about the credit risk of the particular financial instrument or similar financial instruments.

Collateral

AG219. For the purposes of measuring expected credit losses, the estimate of expected cash shortfalls shall reflect the cash flows expected from collateral and other credit enhancements that are part of the contractual terms and are not recognized separately by the entity. The estimate of expected cash shortfalls on a collateralized financial instrument reflects the amount and timing of cash flows that are expected from foreclosure on the collateral less the costs of obtaining and selling the collateral, irrespective of whether foreclosure is probable (i.e., the estimate of expected cash flows considers the probability of a foreclosure and the cash flows that would result from it). Consequently, any cash flows that are expected from the realization of the collateral beyond the contractual maturity of the contract should be included in this analysis. Any collateral obtained as a result of foreclosure is not recognized as an asset that is separate from the collateralized financial instrument unless it meets the relevant recognition criteria for an asset in this or other Standards.

Reclassification of Financial Assets

AG220. If an entity reclassifies financial assets in accordance with paragraph 54, paragraph 94 requires that the reclassification is applied prospectively from the reclassification date. Both the amortized cost measurement category and the fair value through net assets/equity measurement category require that the effective interest rate is determined at initial recognition. Both of those measurement categories also require that the impairment requirements are applied in the same way. Consequently, when an entity reclassifies a financial asset between the amortized cost measurement category and the fair value through net assets/equity measurement category:

(a) The recognition of interest revenue will not change and therefore the entity continues to use the same effective interest rate.

(b) The measurement of expected credit losses will not change because both measurement categories apply the same impairment approach. However if a financial asset is reclassified out of the fair value through net assets/equity measurement category and into the amortized cost measurement category, a loss allowance would be recognized as an adjustment to the gross carrying amount of the financial asset from the reclassification date. If a financial asset is reclassified out of the amortized cost measurement category and into the fair value through net assets/equity measurement category, the loss allowance would be derecognized (and thus would no longer be recognized as an adjustment to the gross carrying amount) but instead would be recognized as an accumulated impairment amount (of an equal amount) in net assets/equity and would be disclosed from the reclassification date.

AG221. However, an entity is not required to separately recognize interest revenue or impairment gains or losses for a financial asset measured at fair value through surplus or deficit. Consequently, when an entity reclassifies a financial asset out of the fair value through surplus or deficit measurement category, the effective interest rate is determined on the basis of the fair value of the asset at the reclassification date. In addition, for the purposes of applying paragraphs 73–93 to the financial asset from the reclassification date, the date of the reclassification is treated as the date of initial recognition.

Gains and Losses

AG222. Paragraph 106 permits an entity to make an irrevocable election to present in net assets/equity changes in the fair value of an investment in an equity instrument that is not held for trading. This election is made on an instrument-by-instrument (i.e., share-by-share) basis. Amounts presented in net assets/equity shall not be subsequently transferred to surplus or deficit. However, the entity may transfer the cumulative gain or loss within net assets/equity. Dividends or similar distributions on such investments are recognized in surplus or deficit in accordance with paragraph 107 unless the dividend clearly represents a recovery of part of the cost of the investment.

AG223. Unless paragraph 44 applies, paragraph 41 requires that a financial asset is measured at fair value through net assets/equity if the contractual terms of the financial asset give rise to cash flows that are solely payments of principal and interest on the principal amount outstanding and the asset is held in a management model whose objective is achieved by both collecting contractual cash flows and selling financial assets. This measurement category recognizes information in surplus or deficit as if the financial asset is measured at amortized cost, while the financial asset is measured in the statement of financial position at fair value. Gains or losses, other than those that are recognized in surplus or deficit in accordance with paragraphs 111–112, are recognized in net assets/equity. When these financial assets are derecognized, cumulative gains or losses previously recognized in net assets/equity are reclassified to surplus or deficit. This reflects the gain or loss that would have been recognized in surplus or deficit upon derecognition if the financial asset had been measured at amortized cost.

AG224. An entity applies IPSAS 4 to financial assets and financial liabilities that are monetary items in accordance with IPSAS 4 and denominated in a foreign currency. IPSAS 4 requires any foreign exchange gains and losses on monetary assets and monetary liabilities to be recognized in surplus or deficit. An exception is a monetary item that is designated as a hedging instrument in a cash flow hedge (see paragraph 140), a hedge of a net investment (see paragraph 142) or a fair value hedge of an equity instrument for which an entity has elected to present changes in fair value in net assets/equity in accordance with paragraph 106 (see paragraph 137).

AG225. For the purpose of recognizing foreign exchange gains and losses under IPSAS 4, a financial asset measured at fair value through net assets/equity in accordance with paragraph 41 is treated as a monetary item. Accordingly, such a financial asset is treated as an asset measured at amortized cost in the foreign currency. Exchange differences on the amortized cost are recognized in surplus or deficit and other changes in the carrying amount are recognized in accordance with paragraph 111.

AG226. Paragraph 106 permits an entity to make an irrevocable election to present in net assets/equity subsequent changes in the fair value of particular investments in equity instruments. Such an investment is not a monetary item. Accordingly, the gain or loss that is presented in net assets/equity in accordance with paragraph 106 includes any related foreign exchange component.

AG227. If there is a hedging relationship between a non-derivative monetary asset and a non-derivative monetary liability, changes in the foreign currency component of those financial instruments are presented in surplus or deficit.

Liabilities Designated as at Fair Value through Surplus or Deficit

AG228. When an entity designates a financial liability as at fair value through surplus or deficit, it must determine whether presenting in net assets/equity the effects of changes in the liability's credit risk would create or enlarge an accounting mismatch in surplus or deficit. An accounting mismatch would be created or enlarged if presenting the effects of changes in the liability's credit risk in net assets/equity would result in a greater mismatch in surplus or deficit than if those amounts were presented in surplus or deficit.

AG229. To make that determination, an entity must assess whether it expects that the effects of changes in the liability's credit risk will be offset in surplus or deficit by a change in the fair value of another financial instrument measured at fair value through surplus or deficit. Such an expectation must be based on an economic relationship between the characteristics of the liability and the characteristics of the other financial instrument.

AG230. That determination is made at initial recognition and is not reassessed. For practical purposes the entity need not enter into all of the assets and liabilities giving rise to an accounting mismatch at exactly the same time. A reasonable delay is permitted provided that any remaining transactions are expected to occur. An entity must apply consistently its methodology for determining whether presenting in net assets/equity the effects of changes in the liability's credit risk would create or enlarge an accounting mismatch in surplus or deficit. However, an entity may use different methodologies when there are different economic relationships between the characteristics of the liabilities designated as at fair value through surplus or deficit and the characteristics of the other financial instruments. IPSAS 30 requires an entity to provide qualitative disclosures in the notes to the financial statements about its methodology for making that determination.

AG231. If such a mismatch would be created or enlarged, the entity is required to present all changes in fair value (including the effects of changes in the credit risk of the liability) in surplus or deficit. If such a mismatch would not be created or enlarged, the entity is required to present the effects of changes in the liability's credit risk in net assets/equity.

AG232. Amounts presented in net assets/equity shall not be subsequently transferred to surplus or deficit. However, the entity may transfer the cumulative gain or loss within equity.

AG233. The following example describes a situation in which an accounting mismatch would be created in surplus or deficit if the effects of changes in the credit risk of the liability were presented in net assets/equity. A Federal Mortgage and Housing Corporation provides loans to customers and funds those loans by selling bonds with matching characteristics (e.g., amount outstanding, repayment profile, term and currency) in the market. The contractual terms of the loan permit the mortgage customer to prepay its loan (i.e., satisfy its obligation to the bank) by buying the corresponding bond at fair value in the market and delivering that bond to the Mortgage and Housing Corporation. As a result of that contractual prepayment right, if the credit quality of the bond worsens (and, thus, the fair value of the Mortgage and Housing Corporation's liability decreases), the fair value of the Mortgage and Housing Corporation's loan asset also decreases. The change in the fair value of the asset reflects the mortgage customer's contractual right to prepay the mortgage loan by buying the underlying bond at fair value (which, in this example, has decreased) and delivering the bond to the Mortgage and Housing Corporation. Consequently, the effects of changes in the credit risk of the liability (the bond) will be offset in surplus or deficit by a corresponding change in the fair value of a financial asset (the loan). If the effects of changes in the liability's credit risk were presented in net assets/equity there would be an accounting mismatch in surplus or deficit. Consequently, the Mortgage and Housing Corporation is required to present all changes in fair value of the liability (including the effects of changes in the liability's credit risk) in surplus or deficit.

AG234. In the example in paragraph AG233, there is a contractual linkage between the effects of changes in the credit risk of the liability and changes in the fair value of the financial asset (i.e., as a result of the mortgage customer's contractual right to prepay the loan by buying the bond at fair value and delivering the bond to the Mortgage and Housing Corporation). However, an accounting mismatch may also occur in the absence of a contractual linkage.

AG235. For the purposes of applying the requirements in paragraphs 108 and 109, an accounting mismatch is not caused solely by the measurement method that an entity uses to determine the effects of changes in a liability's credit risk. An accounting mismatch in surplus or deficit would arise only when the effects of changes in the liability's credit risk (as defined in IPSAS 30) are expected to be offset by changes in the fair value of another financial instrument. A mismatch that arises solely as a result of the measurement method (i.e., because an entity does not isolate changes in a liability's credit risk from some other changes in its fair value) does not affect the determination required by paragraphs 108 and 109. For example, an entity may not isolate changes in a liability's credit risk from changes in liquidity risk. If the entity presents the combined effect of both factors in net assets/equity, a mismatch may occur because changes in liquidity risk may be included in the fair value measurement of the entity's financial assets and the entire fair value change of those assets is presented in surplus or deficit. However, such a mismatch is caused by measurement imprecision, not the offsetting relationship described in paragraph AG229 and, therefore, does not affect the determination required by paragraphs 108 and 109.

The Meaning of 'Credit Risk' (paragraphs 108 and 109)

AG236. IPSAS 30 defines credit risk as 'the risk that one party to a financial instrument will cause a financial loss for the other party by failing to discharge an obligation'. The requirement in paragraph 108(a) relates to the risk that the issuer will fail to perform on that particular liability. It does not necessarily relate to the creditworthiness of the issuer. For example, if an entity issues a collateralized liability and a non-collateralized liability that are otherwise identical, the credit risk of those two liabilities will be different, even though they are issued by the same entity. The credit risk on the collateralized liability will be less than the credit risk of the non-collateralized liability. The credit risk for a collateralized liability may be close to zero.

AG237. For the purposes of applying the requirement in paragraph 108(a), credit risk is different from asset-specific performance risk. Asset-specific performance risk is not related to the risk that an entity will fail to discharge a particular obligation but instead it is related to the risk that a single asset or a group of assets will perform poorly (or not at all).

AG238. The following are examples of asset-specific performance risk:

(a) A liability with a unit-linking feature whereby the amount due to investors is contractually determined on the basis of the performance of specified assets. The effect of that unit-linking feature on the fair value of the liability is asset-specific performance risk, not credit risk.

(b) A liability issued by a structured entity with the following character-istics. The entity is legally isolated so the assets in the entity are ring-fenced solely for the benefit of its investors, even in the event of bankruptcy. The entity enters into no other transactions and the assets in the entity cannot be hypothecated. Amounts are due to the entity's investors only if the ring-fenced assets generate cash flows. Thus, changes in the fair value of the liability primarily reflect changes in the fair value of the assets. The effect of the performance of the assets on the fair value of the liability is asset-specific performance risk, not credit risk.

Determining the Effects of Changes in Credit Risk

AG239. For the purposes of applying the requirement in paragraph 108(a), an entity shall determine the amount of change in the fair value of the financial liability that is attributable to changes in the credit risk of that liability either:

(c) As the amount of change in its fair value that is not attributable to changes in market conditions that give rise to market risk (see paragraphs AG240 and AG241); or

(d) Using an alternative method the entity believes more faithfully represents the amount of change in the liability's fair value that is attributable to changes in its credit risk.

AG240. Changes in market conditions that give rise to market risk include changes in a benchmark interest rate, the price of another entity's financial instrument, a commodity price, a foreign exchange rate or an index of prices or rates.

AG241. If the only significant relevant changes in market conditions for a liability are changes in an observed (benchmark) interest rate, the amount in paragraph AG239(a) can be estimated as follows:

(a) First, the entity computes the liability's internal rate of return at the start of the period using the fair value of the liability and the liability's contractual cash flows at the start of the period. It deducts from this rate of return the observed (benchmark) interest rate at the start of the period, to arrive at an instrument-specific component of the internal rate of return.

(b) Next, the entity calculates the present value of the cash flows associated with the liability using the liability's contractual cash flows at the end of the period and a discount rate equal to the sum of (i) the observed (benchmark) interest rate at the end of the period and (ii) the instrument-specific component of the internal rate of return as determined in (a).

(c) The difference between the fair value of the liability at the end of the period and the amount determined in (b) is the change in fair value that is not attributable to changes in the observed (benchmark) interest rate. This is the amount to be presented in net assets/equity in accordance with paragraph 108(a).

AG242. The example in paragraph AG241 assumes that changes in fair value arising from factors other than changes in the instrument's credit risk or changes in observed (benchmark) interest rates are not significant. This method would not be appropriate if changes in fair value arising from other factors are significant. In those cases, an entity is required to use an alternative method that more faithfully measures the effects of changes

in the liability's credit risk (see paragraph AG239(b)). For example, if the instrument in the example contains an embedded derivative, the change in fair value of the embedded derivative is excluded in determining the amount to be presented in net assets/equity in accordance with paragraph 108(a).

AG243. As with all fair value measurements, an entity's measurement method for determining the portion of the change in the liability's fair value that is attributable to changes in its credit risk must make maximum use of relevant observable inputs and minimum use of unobservable inputs.

Hedge Accounting

Hedging Instruments

Qualifying Instruments

AG244. Derivatives that are embedded in hybrid contracts, but that are not separately accounted for, cannot be designated as separate hedging instruments.

AG245. An entity's own equity instruments are not financial assets or financial liabilities of the entity and therefore cannot be designated as hedging instruments.

AG246. For hedges of foreign currency risk, the foreign currency risk component of a non-derivative financial instrument is determined in accordance with IPSAS 4.

Written Options

AG247. This Standard does not restrict the circumstances in which a derivative that is measured at fair value through surplus or deficit may be designated as a hedging instrument, except for some written options. A written option does not qualify as a hedging instrument unless it is designated as an offset to a purchased option, including one that is embedded in another financial instrument (for example, a written call option used to hedge a callable liability).

Designation of Hedging Instruments

AG248. For hedges other than hedges of foreign currency risk, when an entity designates a non-derivative financial asset or a non-derivative financial liability measured at fair value through surplus or deficit as a hedging instrument, it may only designate the non-derivative financial instrument in its entirety or a proportion of it.

AG249. A single hedging instrument may be designated as a hedging instrument of more than one type of risk, provided that there is a specific designation of the hedging instrument and of the different risk positions as hedged items. Those hedged items can be in different hedging relationships.

Hedged Items

Qualifying Items

AG250. A firm commitment to acquire an operation in a public sector combination cannot be a hedged item, except for foreign currency risk, because the other risks being hedged cannot be specifically identified and measured. Those other risks are general business risks.

AG251. An equity method investment cannot be a hedged item in a fair value hedge. This is because the equity method recognizes in surplus or deficit the investor's share of the investee's surplus or deficit, instead of changes in the investment's fair value. For a similar reason, an investment in a consolidated controlled entity cannot be a hedged item in a fair value hedge. This is because consolidation recognizes in surplus or deficit the controlled entity's surplus or deficit, instead of changes in the investment's fair value. A hedge of a net investment in a foreign operation is different because it is a hedge of the foreign currency exposure, not a fair value hedge of the change in the value of the investment.

AG252. Paragraph 125 permits an entity to designate as hedged items aggregated exposures that are a combination of an exposure and a derivative. When designating such a hedged item, an entity assesses whether the aggregated exposure combines an exposure with a derivative so that it creates a different aggregated exposure that is managed as one exposure for a particular risk (or risks). In that case, the entity may designate the hedged item on the basis of the aggregated exposure. For example:

(a) An entity may hedge a given quantity of highly probable oil purchases in 15 months' time against price risk (based on US dollars) using a 15-month futures contract for oil. The highly probable oil purchases and the futures contract for oil in combination can be viewed as a 15-month fixed-amount US dollar foreign currency risk exposure for risk management purposes (i.e., like any fixed-amount US dollar cash outflow in 15 months' time).

(b) An entity may hedge the foreign currency risk for the entire term of a 10-year fixed-rate debt denominated in a foreign currency. However, the entity requires fixed-rate exposure in its functional currency only for a short to medium-term (say two years) and floating rate exposure in its functional currency for the remaining term to maturity. At the end of each of the two-year intervals (i.e., on a two-year rolling basis) the entity fixes the next two years' interest rate exposure (if the interest level is such that the entity wants to fix interest rates). In such a situation an entity may enter into a 10-year fixed-to-floating cross-currency interest rate swap that swaps the fixed-rate foreign currency debt into a variable-rate functional currency exposure. This is overlaid with a two-year interest rate swap that—on the basis of the functional currency—swaps variable-rate debt into fixed-rate debt. In effect, the fixed-rate foreign currency debt and the 10-year fixed-to-floating cross-currency interest rate swap in combination are viewed as a 10-year variable-rate debt functional currency exposure for risk management purposes.

AG253. When designating the hedged item on the basis of the aggregated exposure, an entity considers the combined effect of the items that constitute the aggregated exposure for the purpose of assessing hedge effectiveness and measuring hedge ineffectiveness. However, the items that constitute the aggregated exposure remain accounted for separately. This means that, for example:

(a) Derivatives that are part of an aggregated exposure are recognized as separate assets or liabilities measured at fair value; and

(b) If a hedging relationship is designated between the items that constitute the aggregated exposure, the way in which a derivative is included as part of an aggregated exposure must be consistent with the designation of that derivative as the hedging instrument at the level of the aggregated exposure. For example, if an entity excludes the forward element of a derivative from its designation as the hedging instrument for the hedging relationship between the items that constitute the aggregated exposure, it must also exclude the forward element when including that derivative as a hedged item as part of the aggregated exposure. Otherwise, the aggregated exposure shall include a derivative, either in its entirety or a proportion of it.

AG254. Paragraph 127 states that in consolidated financial statements the foreign currency risk of a highly probable forecast transaction within an economic entity may qualify as a hedged item in a cash flow hedge, provided that the transaction is denominated in a currency other than the functional currency of the entity entering into that transaction and that the foreign currency risk will affect consolidated surplus or deficit. For this purpose an entity can be a controlling entity, controlled entity, associate, joint arrangement or branch. If the foreign currency risk of a forecast transaction within the economic entity does not affect consolidated surplus or deficit, the transaction cannot qualify as a hedged item. This is usually the case for royalty payments, interest payments or management charges between members of the same economic entity, unless there is a related external transaction. However, when the foreign currency risk of a forecast transaction within an economic entity will affect consolidated surplus or deficit, the transaction within the economic entity can qualify as a

hedged item. An example is forecast sales or purchases of inventories between members of the same economic entity if there is an onward sale of the inventory to a party external to the economic entity. Similarly, a forecast sale of plant and equipment within the economic entity from the entity that manufactured it to an entity that will use the plant and equipment in its operations may affect consolidated surplus or deficit. This could occur, for example, because the plant and equipment will be depreciated by the purchasing entity and the amount initially recognized for the plant and equipment may change if the forecast transaction within the economic entity is denominated in a currency other than the functional currency of the purchasing entity.

AG255. If a hedge of a forecast transaction within an economic entity qualifies for hedge accounting, any gain or loss is recognized in, and taken out of, net assets/equity in accordance with paragraph 140. The relevant period or periods during which the foreign currency risk of the hedged transaction affects surplus or deficit is when it affects consolidated surplus or deficit.

Designation of Hedged Items

AG256. A component is a hedged item that is less than the entire item. Consequently, a component reflects only some of the risks of the item of which it is a part or reflects the risks only to some extent (for example, when designating a proportion of an item).

Risk Components

AG257. To be eligible for designation as a hedged item, a risk component must be a separately identifiable component of the financial or the non-financial item, and the changes in the cash flows or the fair value of the item attributable to changes in that risk component must be reliably measurable.

AG258. When identifying what risk components qualify for designation as a hedged item, an entity assesses such risk components within the context of the particular market structure to which the risk or risks relate and in which the hedging activity takes place. Such a determination requires an evaluation of the relevant facts and circumstances, which differ by risk and market.

AG259. When designating risk components as hedged items, an entity considers whether the risk components are explicitly specified in a contract (contractually specified risk components) or whether they are implicit in the fair value or the cash flows of an item of which they are a part (non-contractually specified risk components). Non-contractually specified risk components can relate to items that are not a contract (for example, forecast transactions) or contracts that do not explicitly specify the component (for example, a firm commitment that includes only one single price instead of a pricing formula that references different underlyings). For example:

(a) Entity A has a long-term supply contract for natural gas that is priced using a contractually specified formula that references commodities and other factors (for example, gas oil, fuel oil and other components such as transport charges). Entity A hedges the gas oil component in that supply contract using a gas oil forward contract. Because the gas oil component is specified by the terms and conditions of the supply contract it is a contractually specified risk component. Hence, because of the pricing formula, Entity A concludes that the gas oil price exposure is separately identifiable. At the same time, there is a market for gas oil forward contracts. Hence, Entity A concludes that the gas oil price exposure is reliably measurable. Consequently, the gas oil price exposure in the supply contract is a risk component that is eligible for designation as a hedged item.

(b) Entity B hedges its future coffee purchases based on its production forecast. Hedging starts up to 15 months before delivery for part of the forecast purchase volume. Entity B increases the hedged volume over time (as the delivery date approaches). Entity B uses two different types of contracts to manage its coffee price risk:

(i) Exchange-traded coffee futures contracts; and

(ii) Coffee supply contracts for Arabica coffee from Colombia delivered to a specific manufacturing site. These contracts price a tonne of coffee based on the exchange-traded coffee futures contract price plus a fixed price differential plus a variable logistics services charge using a pricing formula. The coffee supply contract is an executory contract in accordance with which Entity B takes actual delivery of coffee.

For deliveries that relate to the current harvest, entering into the coffee supply contracts allows Entity B to fix the price differential between the actual coffee quality purchased (Arabica coffee from Colombia) and the benchmark quality that is the underlying of the exchange-traded futures contract. However, for deliveries that relate to the next harvest, the coffee supply contracts are not yet available, so the price differential cannot be fixed. Entity B uses exchange-traded coffee futures contracts to hedge the benchmark quality component of its coffee price risk for deliveries that relate to the current harvest as well as the next harvest. Entity B determines that it is exposed to three different risks: coffee price risk reflecting the benchmark quality, coffee price risk reflecting the difference (spread) between the price for the benchmark quality coffee and the particular Arabica coffee from Colombia that it actually receives, and the variable logistics costs. For deliveries related to the current harvest, after Entity B enters into a coffee supply contract, the coffee price risk reflecting the benchmark quality is a contractually specified risk component because the pricing formula includes an indexation to the exchange-traded coffee futures contract price. Entity B concludes that this risk component is separately identifiable and reliably measurable. For deliveries related to the next harvest, Entity B has not yet entered into any coffee supply contracts (i.e., those deliveries are forecast transactions). Hence, the coffee price risk reflecting the benchmark quality is a non-contractually specified risk component. Entity B's analysis of the market structure takes into account how eventual deliveries of the particular coffee that it receives are priced. Hence, on the basis of this analysis of the market structure, Entity B concludes that the forecast transactions also involve the coffee price risk that reflects the benchmark quality as a risk component that is separately identifiable and reliably measurable even though it is not contractually specified. Consequently, Entity B may designate hedging relationships on a risk components basis (for the coffee price risk that reflects the benchmark quality) for coffee supply contracts as well as forecast transactions.

(c) Entity C hedges part of its future jet fuel purchases on the basis of its consumption forecast up to 24 months before delivery and increases the volume that it hedges over time. Entity C hedges this exposure using different types of contracts depending on the time horizon of the hedge, which affects the market liquidity of the derivatives. For the longer time horizons (12–24 months) Entity C uses crude oil contracts because only these have sufficient market liquidity. For time horizons of 6–12 months Entity C uses gas oil derivatives because they are sufficiently liquid. For time horizons up to six months Entity C uses jet fuel contracts. Entity C's analysis of the market structure for oil and oil products and its evaluation of the relevant facts and circumstances is as follows:

(i) Entity C operates in a geographical area in which Brent is the crude oil benchmark. Crude oil is a raw material benchmark that affects the price of various refined oil products as their most basic input. Gas oil is a benchmark for refined oil products, which is used as a pricing reference for oil distillates more generally. This is also reflected in the types of derivative financial instruments for the crude oil and refined oil products markets of the environment in which Entity C operates, such as:

- The benchmark crude oil futures contract, which is for Brent crude oil;

- The benchmark gas oil futures contract, which is used as the pricing reference for distillates—for example, jet fuel spread derivatives cover the price differential between jet fuel and that benchmark gas oil; and
- The benchmark gas oil crack spread derivative (i.e., the derivative for the price differential between crude oil and gas oil—a refining margin), which is indexed to Brent crude oil.

(ii) The pricing of refined oil products does not depend on which particular crude oil is processed by a particular refinery because those refined oil products (such as gas oil or jet fuel) are standardized products.

Hence, Entity C concludes that the price risk of its jet fuel purchases includes a crude oil price risk component based on Brent crude oil and a gas oil price risk component, even though crude oil and gas oil are not specified in any contractual arrangement. Entity C concludes that these two risk components are separately identifiable and reliably measurable even though they are not contractually specified. Consequently, Entity C may designate hedging relationships for forecast jet fuel purchases on a risk components basis (for crude oil or gas oil). This analysis also means that if, for example, Entity C used crude oil derivatives based on West Texas Intermediate (WTI) crude oil, changes in the price differential between Brent crude oil and WTI crude oil would cause hedge ineffectiveness.

(d) Entity D holds a fixed-rate debt instrument. This instrument is issued in an environment with a market in which a large variety of similar debt instruments are compared by their spreads to a benchmark rate (for example, an interbank offered rate) and variable-rate instruments in that environment are typically indexed to that benchmark rate. Interest rate swaps are frequently used to manage interest rate risk on the basis of that benchmark rate, irrespective of the spread of debt instruments to that benchmark rate. The price of fixed-rate debt instruments varies directly in response to changes in the benchmark rate as they happen. Entity D concludes that the benchmark rate is a component that can be separately identified and reliably measured. Consequently, Entity D may designate hedging relationships for the fixed-rate debt instrument on a risk component basis for the benchmark interest rate risk.

AG260. When designating a risk component as a hedged item, the hedge accounting requirements apply to that risk component in the same way as they apply to other hedged items that are not risk components. For example, the qualifying criteria apply, including that the hedging relationship must meet the hedge effectiveness requirements, and any hedge ineffectiveness must be measured and recognized.

AG261. An entity can also designate only changes in the cash flows or fair value of a hedged item above or below a specified price or other variable (a ‘one-sided risk’). The intrinsic value of a purchased option hedging instrument (assuming that it has the same principal terms as the designated risk), but not its time value, reflects a one-sided risk in a hedged item. For example, an entity can designate the variability of future cash flow outcomes resulting from a price increase of a forecast commodity purchase. In such a situation, the entity designates only cash flow losses that result from an increase in the price above the specified level. The hedged risk does not include the time value of a purchased option, because the time value is not a component of the forecast transaction that affects surplus or deficit.

AG262. There is a rebuttable presumption that unless inflation risk is contractually specified, it is not separately identifiable and reliably measurable and hence cannot be designated as a risk component of a financial instrument. However, in limited cases, it is possible to identify a risk component for inflation risk that is separately identifiable and reliably measurable because of the particular circumstances of the inflation environment and the relevant debt market.

AG263. For example, an entity issues debt in an environment in which inflation-linked bonds have a volume and term structure that results in a sufficiently liquid market that allows constructing a term structure of zero-coupon real interest rates. This means that for the respective currency, inflation is a relevant factor that is separately

considered by the debt markets. In those circumstances the inflation risk component could be determined by discounting the cash flows of the hedged debt instrument using the term structure of zero-coupon real interest rates (i.e., in a manner similar to how a risk-free (nominal) interest rate component can be determined). Conversely, in many cases an inflation risk component is not separately identifiable and reliably measurable. For example, an entity issues only nominal interest rate debt in an environment with a market for inflation-linked bonds that is not sufficiently liquid to allow a term structure of zero-coupon real interest rates to be constructed. In this case the analysis of the market structure and of the facts and circumstances does not support the entity concluding that inflation is a relevant factor that is separately considered by the debt markets. Hence, the entity cannot overcome the rebuttable presumption that inflation risk that is not contractually specified is not separately identifiable and reliably measurable. Consequently, an inflation risk component would not be eligible for designation as the hedged item. This applies irrespective of any inflation hedging instrument that the entity has actually entered into. In particular, the entity cannot simply impute the terms and conditions of the actual inflation hedging instrument by projecting its terms and conditions onto the nominal interest rate debt.

AG264. A contractually specified inflation risk component of the cash flows of a recognized inflation-linked bond (assuming that there is no requirement to account for an embedded derivative separately) is separately identifiable and reliably measurable, as long as other cash flows of the instrument are not affected by the inflation risk component.

Components of a Nominal Amount

AG265. There are two types of components of nominal amounts that can be designated as the hedged item in a hedging relationship: a component that is a proportion of an entire item or a layer component. The type of component changes the accounting outcome. An entity shall designate the component for accounting purposes consistently with its risk management objective.

AG266. An example of a component that is a proportion is 50 percent of the contractual cash flows of a loan.

AG267. A layer component may be specified from a defined, but open, population, or from a defined nominal amount. Examples include:

(a) Part of a monetary transaction volume, for example, the next FC10 cash flows from sales denominated in a foreign currency after the first FC20 in March 201X;[4]

(b) A part of a physical volume, for example, the bottom layer, measuring 5 million cubic meters, of the natural gas stored in location XYZ;

(c) A part of a physical or other transaction volume, for example, the first 100 barrels of the oil purchases in June 201X or the first 100 MWh of electricity sales in June 201X; or

(d) A layer from the nominal amount of the hedged item, for example, the last CU80 million of a CU100 million firm commitment, the bottom layer of CU20 million of a CU100 million fixed-rate bond or the top layer of CU30 million from a total amount of CU100 million of fixed-rate debt that can be prepaid at fair value (the defined nominal amount is CU100 million).

AG268. If a layer component is designated in a fair value hedge, an entity shall specify it from a defined nominal amount. To comply with the requirements for qualifying fair value hedges, an entity shall remeasure the hedged item for fair value changes (i.e., remeasure the item for fair value changes attributable to the hedged risk). The fair value hedge adjustment must be recognized in surplus or deficit no later than when the item is derecognized. Consequently, it is necessary to track the item to which the fair value hedge adjustment relates. For a layer component in a fair value hedge, this requires an entity to track the nominal amount from

[4] In this Standard monetary amounts are denominated in ‘currency units’ (CU) and ‘foreign currency units’ (FC).

which it is defined. For example, in paragraph AG267(d), the total defined nominal amount of CU100 million must be tracked in order to track the bottom layer of CU20 million or the top layer of CU30 million.

AG269. A layer component that includes a prepayment option is not eligible to be designated as a hedged item in a fair value hedge if the prepayment option's fair value is affected by changes in the hedged risk, unless the designated layer includes the effect of the related prepayment option when determining the change in the fair value of the hedged item.

Relationship Between Components and the Total Cash Flows of an Item

AG270. If a component of the cash flows of a financial or a non-financial item is designated as the hedged item, that component must be less than or equal to the total cash flows of the entire item. However, all of the cash flows of the entire item may be designated as the hedged item and hedged for only one particular risk (for example, only for those changes that are attributable to changes in a market related interest rate or a benchmark commodity price).

AG271. For example, in the case of a financial liability whose effective interest rate is below a market related interest rate, an entity cannot designate:

(a) A component of the liability equal to interest at the market rate (plus the principal amount in case of a fair value hedge); and

(b) A negative residual component.

AG272. However, in the case of a fixed-rate financial liability whose effective interest rate is (for example) 100 basis points below the market rate, an entity can designate as the hedged item the change in the value of that entire liability (i.e., principal plus interest at the market rate minus 100 basis points) that is attributable to changes in the market rate. If a fixed-rate financial instrument is hedged some time after its origination and interest rates have changed in the meantime, the entity can designate a risk component equal to a benchmark rate that is higher than the contractual rate paid on the item. The entity can do so provided that the benchmark rate is less than the effective interest rate calculated on the assumption that the entity had purchased the instrument on the day when it first designates the hedged item. For example, assume that an entity originates a fixed-rate financial asset of CU100 that has an effective interest rate of 6 percent at a time when the market rate is 4 percent. It begins to hedge that asset some time later when the market rate has increased to 8 percent and the fair value of the asset has decreased to CU90. The entity calculates that if it had purchased the asset on the date it first designates the related the market rate interest rate risk as the hedged item, the effective yield of the asset based on its then fair value of CU90 would have been 9.5 percent. Because the market rate is less than this effective yield, the entity can designate a the market rate component of 8 percent that consists partly of the contractual interest cash flows and partly of the difference between the current fair value (i.e., CU90) and the amount repayable on maturity (i.e., CU100).

AG273. If a variable-rate financial liability bears interest of (for example) the three-month interbank offered rate minus 20 basis points (with a floor at zero basis points), an entity can designate as the hedged item the change in the cash flows of that entire liability (i.e., the three-month interbank offered rate minus 20 basis points—including the floor) that is attributable to changes in the interbank offered rate. Hence, as long as the three-month interbank offered rate forward curve for the remaining life of that liability does not fall below 20 basis points, the hedged item has the same cash flow variability as a liability that bears interest at the three-month interbank offered rate with a zero or positive spread. However, if the three-month interbank offered rate forward curve for the remaining life of that liability (or a part of it) falls below 20 basis points, the hedged item has a lower cash flow variability than a liability that bears interest at three-month interbank offered rate with a zero or positive spread.

AG274. A similar example of a non-financial item is a specific type of crude oil from a particular oil field that is priced off the relevant benchmark crude oil. If an entity sells that crude oil under a contract using a contractual pricing formula that sets the price per barrel at the benchmark crude oil price minus CU10 with a floor of CU15, the entity can designate as the hedged item the entire cash flow variability under the sales contract that is attributable to the change in the benchmark crude oil price. However, the entity cannot designate a component that is equal to the full change in the benchmark crude oil price. Hence, as long as the forward price (for each delivery) does not fall below CU25, the hedged item has the same cash flow variability as a crude oil sale at the benchmark crude oil price (or with a positive spread). However, if the forward price for any delivery falls below CU25, the hedged item has a lower cash flow variability than a crude oil sale at the benchmark crude oil price (or with a positive spread).

Qualifying Criteria for Hedge Accounting

Hedge Effectiveness

AG275. Hedge effectiveness is the extent to which changes in the fair value or the cash flows of the hedging instrument offset changes in the fair value or the cash flows of the hedged item (for example, when the hedged item is a risk component, the relevant change in fair value or cash flows of an item is the one that is attributable to the hedged risk). Hedge ineffectiveness is the extent to which the changes in the fair value or the cash flows of the hedging instrument are greater or less than those on the hedged item.

AG276. When designating a hedging relationship and on an ongoing basis, an entity shall analyze the sources of hedge ineffectiveness that are expected to affect the hedging relationship during its term. This analysis (including any updates in accordance with paragraph AG314 arising from rebalancing a hedging relationship) is the basis for the entity's assessment of meeting the hedge effectiveness requirements.

AG277. For the avoidance of doubt, the effects of replacing the original counterparty with a clearing counterparty and making the associated changes as described in paragraph 135 shall be reflected in the measurement of the hedging instrument and therefore in the assessment of hedge effectiveness and the measurement of hedge effectiveness.

Economic Relationship Between the Hedged Item and the Hedging Instrument

AG278. The requirement that an economic relationship exists means that the hedging instrument and the hedged item have values that generally move in the opposite direction because of the same risk, which is the hedged risk. Hence, there must be an expectation that the value of the hedging instrument and the value of the hedged item will systematically change in response to movements in either the same underlying or underlyings that are economically related in such a way that they respond in a similar way to the risk that is being hedged (for example, Brent and WTI crude oil).

AG279. If the underlyings are not the same but are economically related, there can be situations in which the values of the hedging instrument and the hedged item move in the same direction, for example, because the price differential between the two related underlyings changes while the underlyings themselves do not move significantly. That is still consistent with an economic relationship between the hedging instrument and the hedged item if the values of the hedging instrument and the hedged item are still expected to typically move in the opposite direction when the underlyings move.

AG280. The assessment of whether an economic relationship exists includes an analysis of the possible behavior of the hedging relationship during its term to ascertain whether it can be expected to meet the risk management objective. The mere existence of a statistical correlation between two variables does not, by itself, support a valid conclusion that an economic relationship exists.

The Effect of Credit Risk

AG281. Because the hedge accounting model is based on a general notion of offset between gains and losses on the hedging instrument and the hedged item, hedge effectiveness is determined not only by the economic relationship between those items (i.e., the changes in their underlyings) but also by the effect of credit risk on the value of both the hedging instrument and the hedged item. The effect of credit risk means that even if there is an economic relationship between the hedging instrument and the hedged item, the level of offset might become erratic. This can result from a change in the credit risk of either the hedging instrument or the hedged item that is of such a magnitude that the credit risk dominates the value changes that result from the economic relationship (i.e., the effect of the changes in the underlyings). A level of magnitude that gives rise to dominance is one that would result in the loss (or gain) from credit risk frustrating the effect of changes in the underlyings on the value of the hedging instrument or the hedged item, even if those changes were significant. Conversely, if during a particular period there is little change in the underlyings, the fact that even small credit risk-related changes in the value of the hedging instrument or the hedged item might affect the value more than the underlyings does not create dominance.

AG282. An example of credit risk dominating a hedging relationship is when an entity hedges an exposure to commodity price risk using an uncollateralized derivative. If the counterparty to that derivative experiences a severe deterioration in its credit standing, the effect of the changes in the counterparty's credit standing might outweigh the effect of changes in the commodity price on the fair value of the hedging instrument, whereas changes in the value of the hedged item depend largely on the commodity price changes.

Hedge Ratio

AG283. In accordance with the hedge effectiveness requirements, the hedge ratio of the hedging relationship must be the same as that resulting from the quantity of the hedged item that the entity actually hedges and the quantity of the hedging instrument that the entity actually uses to hedge that quantity of hedged item. Hence, if an entity hedges less than 100 percent of the exposure on an item, such as 85 percent, it shall designate the hedging relationship using a hedge ratio that is the same as that resulting from 85 percent of the exposure and the quantity of the hedging instrument that the entity actually uses to hedge those 85 percent. Similarly, if, for example, an entity hedges an exposure using a nominal amount of 40 units of a financial instrument, it shall designate the hedging relationship using a hedge ratio that is the same as that resulting from that quantity of 40 units (i.e., the entity must not use a hedge ratio based on a higher quantity of units that it might hold in total or a lower quantity of units) and the quantity of the hedged item that it actually hedges with those 40 units.

AG284. However, the designation of the hedging relationship using the same hedge ratio as that resulting from the quantities of the hedged item and the hedging instrument that the entity actually uses shall not reflect an imbalance between the weightings of the hedged item and the hedging instrument that would in turn create hedge ineffectiveness (irrespective of whether recognized or not) that could result in an accounting outcome that would be inconsistent with the purpose of hedge accounting. Hence, for the purpose of designating a hedging relationship, an entity must adjust the hedge ratio that results from the quantities of the hedged item and the hedging instrument that the entity actually uses if that is needed to avoid such an imbalance.

AG285. Examples of relevant considerations in assessing whether an accounting outcome is inconsistent with the purpose of hedge accounting are:

(a) Whether the intended hedge ratio is established to avoid recognizing hedge ineffectiveness for cash flow hedges, or to achieve fair value hedge adjustments for more hedged items with the aim of increasing the use of fair value accounting, but without offsetting fair value changes of the hedging instrument; and

(b) Whether there is a commercial reason for the particular weightings of the hedged item and the hedging instrument, even though that creates hedge ineffectiveness. For example, an entity enters into and designates a quantity of the hedging instrument that is not the quantity that it determined as the best hedge of the hedged item because the standard volume of the hedging instruments does not allow it to enter into that exact quantity of hedging instrument (a 'lot size issue'). An example is an entity that hedges 1,000 tonnes of oil purchases with standard oil futures contracts that have a contract size of 1,000 barrels. The entity could only use either seven or eight contracts (equivalent to 980 tonnes and 1,120 tonnes respectively) to hedge the purchase volume of 1,000 tonnes. In that case, the entity designates the hedging relationship using the hedge ratio that results from the number of oil futures contracts that it actually uses, because the hedge ineffectiveness resulting from the mismatch in the weightings of the hedged item and the hedging instrument would not result in an accounting outcome that is inconsistent with the purpose of hedge accounting.

Frequency of Assessing Whether the Hedge Effectiveness Requirements are Met

AG286. An entity shall assess at the inception of the hedging relationship, and on an ongoing basis, whether a hedging relationship meets the hedge effectiveness requirements. At a minimum, an entity shall perform the ongoing assessment at each reporting date or upon a significant change in the circumstances affecting the hedge effectiveness requirements, whichever comes first. The assessment relates to expectations about hedge effectiveness and is therefore only forward-looking.

Methods for Assessing Whether the Hedge Effectiveness Requirements are Met

AG287. This Standard does not specify a method for assessing whether a hedging relationship meets the hedge effectiveness requirements. However, an entity shall use a method that captures the relevant characteristics of the hedging relationship including the sources of hedge ineffectiveness. Depending on those factors, the method can be a qualitative or a quantitative assessment.

AG288. For example, when the critical terms (such as the nominal amount, maturity and underlying) of the hedging instrument and the hedged item match or are closely aligned, it might be possible for an entity to conclude on the basis of a qualitative assessment of those critical terms that the hedging instrument and the hedged item have values that will generally move in the opposite direction because of the same risk and hence that an economic relationship exists between the hedged item and the hedging instrument (see paragraphs AG278–AG280).

AG289. The fact that a derivative is in or out of the money when it is designated as a hedging instrument does not in itself mean that a qualitative assessment is inappropriate. It depends on the circumstances whether hedge ineffectiveness arising from that fact could have a magnitude that a qualitative assessment would not adequately capture.

AG290. Conversely, if the critical terms of the hedging instrument and the hedged item are not closely aligned, there is an increased level of uncertainty about the extent of offset. Consequently, the hedge effectiveness during the term of the hedging relationship is more difficult to predict. In such a situation it might only be possible for an entity to conclude on the basis of a quantitative assessment that an economic relationship exists between the hedged item and the hedging instrument (see paragraphs AG278–AG280). In some situations a quantitative assessment might also be needed to assess whether the hedge ratio used for designating the hedging relationship meets the hedge effectiveness requirements (see paragraphs AG283–AG285). An entity can use the same or different methods for those two different purposes.

AG291. If there are changes in circumstances that affect hedge effectiveness, an entity may have to change the method for assessing whether a hedging relationship meets the hedge effectiveness requirements in order to ensure that the relevant characteristics of the hedging relationship, including the sources of hedge ineffectiveness, are still captured.

AG292. An entity's risk management is the main source of information to perform the assessment of whether a hedging relationship meets the hedge effectiveness requirements. This means that the management information (or analysis) used for decision-making purposes can be used as a basis for assessing whether a hedging relationship meets the hedge effectiveness requirements.

AG293. An entity's documentation of the hedging relationship includes how it will assess the hedge effectiveness requirements, including the method or methods used. The documentation of the hedging relationship shall be updated for any changes to the methods (see paragraph AG291).

Accounting for Qualifying Hedging Relationships

AG294. An example of a fair value hedge is a hedge of exposure to changes in the fair value of a fixed-rate debt instrument arising from changes in interest rates. Such a hedge could be entered into by the issuer or by the holder.

AG295. The purpose of a cash flow hedge is to defer the gain or loss on the hedging instrument to a period or periods in which the hedged expected future cash flows affect surplus or deficit. An example of a cash flow hedge is the use of a swap to change floating rate debt (whether measured at amortized cost or fair value) to fixed-rate debt (i.e., a hedge of a future transaction in which the future cash flows being hedged are the future interest payments). Conversely, a forecast purchase of an equity instrument that, once acquired, will be accounted for at fair value through surplus or deficit, is an example of an item that cannot be the hedged item in a cash flow hedge, because any gain or loss on the hedging instrument that would be deferred could not be appropriately reclassified to surplus or deficit during a period in which it would achieve offset. For the same reason, a forecast purchase of an equity instrument that, once acquired, will be accounted for at fair value with changes in fair value presented in net assets/equity also cannot be the hedged item in a cash flow hedge.

AG296. A hedge of a firm commitment (for example, a hedge of the change in fuel price relating to an unrecognized contractual commitment by an electric utility to purchase fuel at a fixed price) is a hedge of an exposure to a change in fair value. Accordingly, such a hedge is a fair value hedge. However, in accordance with paragraph 133, a hedge of the foreign currency risk of a firm commitment could alternatively be accounted for as a cash flow hedge.

Measurement of Hedge Ineffectiveness

AG297. When measuring hedge ineffectiveness, an entity shall consider the time value of money. Consequently, the entity determines the value of the hedged item on a present value basis and therefore the change in the value of the hedged item also includes the effect of the time value of money.

AG298. To calculate the change in the value of the hedged item for the purpose of measuring hedge ineffectiveness, an entity may use a derivative that would have terms that match the critical terms of the hedged item (this is commonly referred to as a 'hypothetical derivative'), and, for example for a hedge of a forecast transaction, would be calibrated using the hedged price (or rate) level. For example, if the hedge was for a two-sided risk at the current market level, the hypothetical derivative would represent a hypothetical forward contract that is calibrated to a value of nil at the time of designation of the hedging relationship. If the hedge was for example for a one-sided risk, the hypothetical derivative would represent the intrinsic value of a hypothetical option that at the time of designation of the hedging relationship is at the money if the hedged price level is the current market level, or out of the money if the hedged price level is above (or, for a hedge of a long position, below) the current market level. Using a hypothetical derivative is one possible way of calculating the change in the value of the hedged item. The hypothetical derivative replicates the hedged item and hence results in the same outcome as if that change in value was determined by a different approach. Hence, using a 'hypothetical derivative' is not a method in its own right but a mathematical expedient that can only be used to calculate the value of the hedged item. Consequently, a 'hypothetical derivative' cannot be used to include

features in the value of the hedged item that only exist in the hedging instrument (but not in the hedged item). An example is debt denominated in a foreign currency (irrespective of whether it is fixed-rate or variable-rate debt). When using a hypothetical derivative to calculate the change in the value of such debt or the present value of the cumulative change in its cash flows, the hypothetical derivative cannot simply impute a charge for exchanging different currencies even though actual derivatives under which different currencies are exchanged might include such a charge (for example, cross-currency interest rate swaps).

AG299. The change in the value of the hedged item determined using a hypothetical derivative may also be used for the purpose of assessing whether a hedging relationship meets the hedge effectiveness requirements.

Rebalancing the Hedging Relationship and Changes to the Hedge Ratio

AG300. Rebalancing refers to the adjustments made to the designated quantities of the hedged item or the hedging instrument of an already existing hedging relationship for the purpose of maintaining a hedge ratio that complies with the hedge effectiveness requirements. Changes to designated quantities of a hedged item or of a hedging instrument for a different purpose do not constitute rebalancing for the purpose of this Standard.

AG301. Rebalancing is accounted for as a continuation of the hedging relationship in accordance with paragraphs AG302–AG314. On rebalancing, the hedge ineffectiveness of the hedging relationship is determined and recognized immediately before adjusting the hedging relationship.

AG302. Adjusting the hedge ratio allows an entity to respond to changes in the relationship between the hedging instrument and the hedged item that arise from their underlyings or risk variables. For example, a hedging relationship in which the hedging instrument and the hedged item have different but related underlyings changes in response to a change in the relationship between those two underlyings (for example, different but related reference indices, rates or prices). Hence, rebalancing allows the continuation of a hedging relationship in situations in which the relationship between the hedging instrument and the hedged item changes in a way that can be compensated for by adjusting the hedge ratio.

AG303. For example, an entity hedges an exposure to Foreign Currency A using a currency derivative that references Foreign Currency B and Foreign Currencies A and B are pegged (i.e., their exchange rate is maintained within a band or at an exchange rate set by a central bank or other authority). If the exchange rate between Foreign Currency A and Foreign Currency B were changed (i.e., a new band or rate was set), rebalancing the hedging relationship to reflect the new exchange rate would ensure that the hedging relationship would continue to meet the hedge effectiveness requirement for the hedge ratio in the new circumstances. In contrast, if there was a default on the currency derivative, changing the hedge ratio could not ensure that the hedging relationship would continue to meet that hedge effectiveness requirement. Hence, rebalancing does not facilitate the continuation of a hedging relationship in situations in which the relationship between the hedging instrument and the hedged item changes in a way that cannot be compensated for by adjusting the hedge ratio.

AG304. Not every change in the extent of offset between the changes in the fair value of the hedging instrument and the hedged item's fair value or cash flows constitutes a change in the relationship between the hedging instrument and the hedged item. An entity analyzes the sources of hedge ineffectiveness that it expected to affect the hedging relationship during its term and evaluates whether changes in the extent of offset are:

(a) Fluctuations around the hedge ratio, which remains valid (i.e., continues to appropriately reflect the relationship between the hedging instrument and the hedged item); or

(b) An indication that the hedge ratio no longer appropriately reflects the relationship between the hedging instrument and the hedged item.

An entity performs this evaluation against the hedge effectiveness requirement for the hedge ratio, i.e., to ensure that the hedging relationship does not reflect an imbalance between the weightings of the hedged

item and the hedging instrument that would create hedge ineffectiveness (irrespective of whether recognized or not) that could result in an accounting outcome that would be inconsistent with the purpose of hedge accounting. Hence, this evaluation requires judgment.

AG305. Fluctuation around a constant hedge ratio (and hence the related hedge ineffectiveness) cannot be reduced by adjusting the hedge ratio in response to each particular outcome. Hence, in such circumstances, the change in the extent of offset is a matter of measuring and recognizing hedge ineffectiveness but does not require rebalancing.

AG306. Conversely, if changes in the extent of offset indicate that the fluctuation is around a hedge ratio that is different from the hedge ratio that is currently used for that hedging relationship, or that there is a trend leading away from that hedge ratio, hedge ineffectiveness can be reduced by adjusting the hedge ratio, whereas retaining the hedge ratio would increasingly produce hedge ineffectiveness. Hence, in such circumstances, an entity must evaluate whether the hedging relationship reflects an imbalance between the weightings of the hedged item and the hedging instrument that would create hedge ineffectiveness (irrespective of whether recognized or not) that could result in an accounting outcome that would be inconsistent with the purpose of hedge accounting. If the hedge ratio is adjusted, it also affects the measurement and recognition of hedge ineffectiveness because, on rebalancing, the hedge ineffectiveness of the hedging relationship must be determined and recognized immediately before adjusting the hedging relationship in accordance with paragraph AG301.

AG307. Rebalancing means that, for hedge accounting purposes, after the start of a hedging relationship an entity adjusts the quantities of the hedging instrument or the hedged item in response to changes in circumstances that affect the hedge ratio of that hedging relationship. Typically, that adjustment should reflect adjustments in the quantities of the hedging instrument and the hedged item that it actually uses. However, an entity must adjust the hedge ratio that results from the quantities of the hedged item or the hedging instrument that it actually uses if:

(a) The hedge ratio that results from changes to the quantities of the hedging instrument or the hedged item that the entity actually uses would reflect an imbalance that would create hedge ineffectiveness that could result in an accounting outcome that would be inconsistent with the purpose of hedge accounting; or

(b) An entity would retain quantities of the hedging instrument and the hedged item that it actually uses, resulting in a hedge ratio that, in new circumstances, would reflect an imbalance that would create hedge ineffectiveness that could result in an accounting outcome that would be inconsistent with the purpose of hedge accounting (i.e., an entity must not create an imbalance by omitting to adjust the hedge ratio).

AG308. Rebalancing does not apply if the risk management objective for a hedging relationship has changed. Instead, hedge accounting for that hedging relationship shall be discontinued (despite that an entity might designate a new hedging relationship that involves the hedging instrument or hedged item of the previous hedging relationship as described in paragraph AG321).

AG309. If a hedging relationship is rebalanced, the adjustment to the hedge ratio can be effected in different ways:

(a) The weighting of the hedged item can be increased (which at the same time reduces the weighting of the hedging instrument) by:

(i) Increasing the volume of the hedged item; or

(ii) Decreasing the volume of the hedging instrument.

(b) The weighting of the hedging instrument can be increased (which at the same time reduces the weighting of the hedged item) by:

(i) Increasing the volume of the hedging instrument; or

(ii) Decreasing the volume of the hedged item.

Changes in volume refer to the quantities that are part of the hedging relationship. Hence, decreases in volumes do not necessarily mean that the items or transactions no longer exist, or are no longer expected to occur, but that they are not part of the hedging relationship. For example, decreasing the volume of the hedging instrument can result in the entity retaining a derivative, but only part of it might remain a hedging instrument of the hedging relationship. This could occur if the rebalancing could be effected only by reducing the volume of the hedging instrument in the hedging relationship, but with the entity retaining the volume that is no longer needed. In that case, the undesignated part of the derivative would be accounted for at fair value through surplus or deficit (unless it was designated as a hedging instrument in a different hedging relationship).

AG310. Adjusting the hedge ratio by increasing the volume of the hedged item does not affect how the changes in the fair value of the hedging instrument are measured. The measurement of the changes in the value of the hedged item related to the previously designated volume also remains unaffected. However, from the date of rebalancing, the changes in the value of the hedged item also include the change in the value of the additional volume of the hedged item. These changes are measured starting from, and by reference to, the date of rebalancing instead of the date on which the hedging relationship was designated. For example, if an entity originally hedged a volume of 100 tonnes of a commodity at a forward price of CU80 (the forward price at inception of the hedging relationship) and added a volume of 10 tonnes on rebalancing when the forward price was CU90, the hedged item after rebalancing would comprise two layers: 100 tonnes hedged at CU80 and 10 tonnes hedged at CU90.

AG311. Adjusting the hedge ratio by decreasing the volume of the hedging instrument does not affect how the changes in the value of the hedged item are measured. The measurement of the changes in the fair value of the hedging instrument related to the volume that continues to be designated also remains unaffected. However, from the date of rebalancing, the volume by which the hedging instrument was decreased is no longer part of the hedging relationship. For example, if an entity originally hedged the price risk of a commodity using a derivative volume of 100 tonnes as the hedging instrument and reduces that volume by 10 tonnes on rebalancing, a nominal amount of 90 tonnes of the hedging instrument volume would remain (see paragraph AG309 for the consequences for the derivative volume (i.e., the 10 tonnes) that is no longer a part of the hedging relationship).

AG312. Adjusting the hedge ratio by increasing the volume of the hedging instrument does not affect how the changes in the value of the hedged item are measured. The measurement of the changes in the fair value of the hedging instrument related to the previously designated volume also remains unaffected. However, from the date of rebalancing, the changes in the fair value of the hedging instrument also include the changes in the value of the additional volume of the hedging instrument. The changes are measured starting from, and by reference to, the date of rebalancing instead of the date on which the hedging relationship was designated. For example, if an entity originally hedged the price risk of a commodity using a derivative volume of 100 tonnes as the hedging instrument and added a volume of 10 tonnes on rebalancing, the hedging instrument after rebalancing would comprise a total derivative volume of 110 tonnes. The change in the fair value of the hedging instrument is the total change in the fair value of the derivatives that make up the total volume of 110 tonnes. These derivatives could (and probably would) have different critical terms, such as their forward rates, because they were entered into at different points in time (including the possibility of designating derivatives into hedging relationships after their initial recognition).

AG313. Adjusting the hedge ratio by decreasing the volume of the hedged item does not affect how the changes in the fair value of the hedging instrument are measured. The measurement of the changes in the value of the hedged item related to the volume that continues to be designated also remains unaffected. However, from

the date of rebalancing, the volume by which the hedged item was decreased is no longer part of the hedging relationship. For example, if an entity originally hedged a volume of 100 tonnes of a commodity at a forward price of CU80 and reduces that volume by 10 tonnes on rebalancing, the hedged item after rebalancing would be 90 tonnes hedged at CU80. The 10 tonnes of the hedged item that are no longer part of the hedging relationship would be accounted for in accordance with the requirements for the discontinuation of hedge accounting (see paragraphs 135–136 and AG315–AG321).

AG314. When rebalancing a hedging relationship, an entity shall update its analysis of the sources of hedge ineffectiveness that are expected to affect the hedging relationship during its (remaining) term (see paragraph AG276). The documentation of the hedging relationship shall be updated accordingly.

Discontinuation of Hedge Accounting

AG315. Discontinuation of hedge accounting applies prospectively from the date on which the qualifying criteria are no longer met.

AG316. An entity shall not de-designate and thereby discontinue a hedging relationship that:

(a) Still meets the risk management objective on the basis of which it qualified for hedge accounting (i.e., the entity still pursues that risk management objective); and

(b) Continues to meet all other qualifying criteria (after taking into account any rebalancing of the hedging relationship, if applicable).

AG317. For the purposes of this Standard, an entity's risk management strategy is distinguished from its risk management objectives. The risk management strategy is established at the highest level at which an entity determines how it manages its risk. Risk management strategies typically identify the risks to which the entity is exposed and set out how the entity responds to them. A risk management strategy is typically in place for a longer period and may include some flexibility to react to changes in circumstances that occur while that strategy is in place (for example, different interest rate or commodity price levels that result in a different extent of hedging). This is normally set out in a general document that is cascaded down through an entity through policies containing more specific guidelines. In contrast, the risk management objective for a hedging relationship applies at the level of a particular hedging relationship. It relates to how the particular hedging instrument that has been designated is used to hedge the particular exposure that has been designated as the hedged item. Hence, a risk management strategy can involve many different hedging relationships whose risk management objectives relate to executing that overall risk management strategy. For example:

(a) An entity has a strategy of managing its interest rate exposure on debt funding that sets ranges for the overall entity for the mix between variable-rate and fixed-rate funding. The strategy is to maintain between 20 percent and 40 percent of the debt at fixed rates. The entity decides from time to time how to execute this strategy (i.e., where it positions itself within the 20 percent to 40 percent range for fixed-rate interest exposure) depending on the level of interest rates. If interest rates are low the entity fixes the interest for more debt than when interest rates are high. The entity's debt is CU100 of variable-rate debt of which CU30 is swapped into a fixed-rate exposure. The entity takes advantage of low interest rates to issue an additional CU50 of debt to finance a major investment, which the entity does by issuing a fixed-rate bond. In the light of the low interest rates, the entity decides to set its fixed interest-rate exposure to 40 percent of the total debt by reducing by CU20 the extent to which it previously hedged its variable-rate exposure, resulting in CU60 of fixed-rate exposure. In this situation the risk management strategy itself remains unchanged. However, in contrast the entity's execution of that strategy has changed and this means that, for CU20 of variable-rate exposure that was previously hedged, the risk management objective has changed (i.e., at the hedging relationship level). Consequently, in this situation hedge accounting must be discontinued for CU20 of the previously hedged variable-rate exposure. This could involve reducing the swap position by a CU20 nominal

amount but, depending on the circumstances, an entity might retain that swap volume and, for example, use it for hedging a different exposure or it might become part of a trading book. Conversely, if an entity instead swapped a part of its new fixed-rate debt into a variable-rate exposure, hedge accounting would have to be continued for its previously hedged variable-rate exposure.

(b) Some exposures result from positions that frequently change, for example, the interest rate risk of an open portfolio of debt instruments. The addition of new debt instruments and the derecognition of debt instruments continuously change that exposure (i.e., it is different from simply running off a position that matures). This is a dynamic process in which both the exposure and the hedging instruments used to manage it do not remain the same for long. Consequently, an entity with such an exposure frequently adjusts the hedging instruments used to manage the interest rate risk as the exposure changes. For example, debt instruments with 24 months' remaining maturity are designated as the hedged item for interest rate risk for 24 months. The same procedure is applied to other time buckets or maturity periods. After a short period of time, the entity discontinues all, some or a part of the previously designated hedging relationships for maturity periods and designates new hedging relationships for maturity periods on the basis of their size and the hedging instruments that exist at that time. The discontinuation of hedge accounting in this situation reflects that those hedging relationships are established in such a way that the entity looks at a new hedging instrument and a new hedged item instead of the hedging instrument and the hedged item that were designated previously. The risk management strategy remains the same, but there is no risk management objective that continues for those previously designated hedging relationships, which as such no longer exist. In such a situation, the discontinuation of hedge accounting applies to the extent to which the risk management objective has changed. This depends on the situation of an entity and could, for example, affect all or only some hedging relationships of a maturity period, or only part of a hedging relationship.

(c) An entity has a risk management strategy whereby it manages the foreign currency risk of forecast sales and the resulting receivables. Within that strategy the entity manages the foreign currency risk as a particular hedging relationship only up to the point of the recognition of the receivable. Thereafter, the entity no longer manages the foreign currency risk on the basis of that particular hedging relationship. Instead, it manages together the foreign currency risk from receivables, payables and derivatives (that do not relate to forecast transactions that are still pending) denominated in the same foreign currency. For accounting purposes, this works as a 'natural' hedge because the gains and losses from the foreign currency risk on all of those items are immediately recognized in surplus or deficit. Consequently, for accounting purposes, if the hedging relationship is designated for the period up to the payment date, it must be discontinued when the receivable is recognized, because the risk management objective of the original hedging relationship no longer applies. The foreign currency risk is now managed within the same strategy but on a different basis. Conversely, if an entity had a different risk management objective and managed the foreign currency risk as one continuous hedging relationship specifically for that forecast sales amount and the resulting receivable until the settlement date, hedge accounting would continue until that date.

AG318. The discontinuation of hedge accounting can affect:

(a) A hedging relationship in its entirety; or

(b) A part of a hedging relationship (which means that hedge accounting continues for the remainder of the hedging relationship).

AG319. A hedging relationship is discontinued in its entirety when, as a whole, it ceases to meet the qualifying criteria. For example:

(a) The hedging relationship no longer meets the risk management objective on the basis of which it qualified for hedge accounting (i.e., the entity no longer pursues that risk management objective);

(b) The hedging instrument or instruments have been sold or terminated (in relation to the entire volume that was part of the hedging relationship); or

(c) There is no longer an economic relationship between the hedged item and the hedging instrument or the effect of credit risk starts to dominate the value changes that result from that economic relationship.

AG320. A part of a hedging relationship is discontinued (and hedge accounting continues for its remainder) when only a part of the hedging relationship ceases to meet the qualifying criteria. For example:

(a) On rebalancing of the hedging relationship, the hedge ratio might be adjusted in such a way that some of the volume of the hedged item is no longer part of the hedging relationship (see paragraph AG313); hence, hedge accounting is discontinued only for the volume of the hedged item that is no longer part of the hedging relationship; or

(b) When the occurrence of some of the volume of the hedged item that is (or is a component of) a forecast transaction is no longer highly probable, hedge accounting is discontinued only for the volume of the hedged item whose occurrence is no longer highly probable. However, if an entity has a history of having designated hedges of forecast transactions and having subsequently determined that the forecast transactions are no longer expected to occur, the entity's ability to predict forecast transactions accurately is called into question when predicting similar forecast transactions. This affects the assessment of whether similar forecast transactions are highly probable (see paragraph 124) and hence whether they are eligible as hedged items.

AG321. An entity can designate a new hedging relationship that involves the hedging instrument or hedged item of a previous hedging relationship for which hedge accounting was (in part or in its entirety) discontinued. This does not constitute a continuation of a hedging relationship but is a restart. For example:

(a) A hedging instrument experiences such a severe credit deterioration that the entity replaces it with a new hedging instrument. This means that the original hedging relationship failed to achieve the risk management objective and is hence discontinued in its entirety. The new hedging instrument is designated as the hedge of the same exposure that was hedged previously and forms a new hedging relationship. Hence, the changes in the fair value or the cash flows of the hedged item are measured starting from, and by reference to, the date of designation of the new hedging relationship instead of the date on which the original hedging relationship was designated.

(b) A hedging relationship is discontinued before the end of its term. The hedging instrument in that hedging relationship can be designated as the hedging instrument in another hedging relationship (for example, when adjusting the hedge ratio on rebalancing by increasing the volume of the hedging instrument or when designating a whole new hedging relationship).

Accounting for the Time Value of Options

AG322. An option can be considered as being related to a time period because its time value represents a charge for providing protection for the option holder over a period of time. However, the relevant aspect for the purpose of assessing whether an option hedges a transaction or time-period related hedged item are the characteristics of that hedged item, including how and when it affects surplus or deficit. Hence, an entity shall assess the type of hedged item (see paragraph 144(a)) on the basis of the nature of the hedged item (regardless of whether the hedging relationship is a cash flow hedge or a fair value hedge):

(a) The time value of an option relates to a transaction related hedged item if the nature of the hedged item is a transaction for which the time value has the character of costs of that transaction. An example

is when the time value of an option relates to a hedged item that results in the recognition of an item whose initial measurement includes transaction costs (for example, an entity hedges a commodity purchase, whether it is a forecast transaction or a firm commitment, against the commodity price risk and includes the transaction costs in the initial measurement of the inventory). As a consequence of including the time value of the option in the initial measurement of the particular hedged item, the time value affects surplus or deficit at the same time as that hedged item. Similarly, an entity that hedges a sale of a commodity, whether it is a forecast transaction or a firm commitment, would include the time value of the option as part of the cost related to that sale (hence, the time value would be recognized in surplus or deficit in the same period as the revenue from the hedged sale).

(b) The time value of an option relates to a time-period related hedged item if the nature of the hedged item is such that the time value has the character of a cost for obtaining protection against a risk over a particular period of time (but the hedged item does not result in a transaction that involves the notion of a transaction cost in accordance with (a)). For example, if commodity inventory is hedged against a fair value decrease for six months using a commodity option with a corresponding life, the time value of the option would be allocated to surplus or deficit (i.e., amortized on a systematic and rational basis) over that six-month period. Another example is a hedge of a net investment in a foreign operation that is hedged for 18 months using a foreign-exchange option, which would result in allocating the time value of the option over that 18-month period.

AG323. The characteristics of the hedged item, including how and when the hedged item affects surplus or deficit, also affect the period over which the time value of an option that hedges a time-period related hedged item is amortized, which is consistent with the period over which the option's intrinsic value can affect surplus or deficit in accordance with hedge accounting. For example, if an interest rate option (a cap) is used to provide protection against increases in the interest expense on a floating rate bond, the time value of that cap is amortized to surplus or deficit over the same period over which any intrinsic value of the cap would affect surplus or deficit:

(a) If the cap hedges increases in interest rates for the first three years out of a total life of the floating rate bond of five years, the time value of that cap is amortized over the first three years; or

(b) If the cap is a forward start option that hedges increases in interest rates for years two and three out of a total life of the floating rate bond of five years, the time value of that cap is amortized during years two and three.

AG324. The accounting for the time value of options in accordance with paragraph 144 also applies to a combination of a purchased and a written option (one being a put option and one being a call option) that at the date of designation as a hedging instrument has a net nil time value (commonly referred to as a 'zero-cost collar'). In that case, an entity shall recognize any changes in time value in net assets/equity, even though the cumulative change in time value over the total period of the hedging relationship is nil. Hence, if the time value of the option relates to:

(a) A transaction related hedged item, the amount of time value at the end of the hedging relationship that adjusts the hedged item or that is reclassified to surplus or deficit (see paragraph 144(b)) would be nil.

(b) A time-period related hedged item, the amortization expense related to the time value is nil.

AG325. The accounting for the time value of options in accordance with paragraph 144 applies only to the extent that the time value relates to the hedged item (aligned time value). The time value of an option relates to the hedged item if the critical terms of the option (such as the nominal amount, life and underlying) are aligned with the hedged item. Hence, if the critical terms of the option and the hedged item are not fully aligned, an entity shall determine the aligned time value, i.e., how much of the time value included in the premium (actual time value) relates to the hedged item (and therefore should be treated in accordance with paragraph 144).

An entity determines the aligned time value using the valuation of the option that would have critical terms that perfectly match the hedged item.

AG326. If the actual time value and the aligned time value differ, an entity shall determine the amount that is accumulated in a separate component of net assets/equity in accordance with paragraph 144 as follows:

(a) If, at inception of the hedging relationship, the actual time value is higher than the aligned time value, the entity shall:

(i) Determine the amount that is accumulated in a separate component of net assets/equity on the basis of the aligned time value; and

(ii) Account for the differences in the fair value changes between the two time values in surplus or deficit.

(b) If, at inception of the hedging relationship, the actual time value is lower than the aligned time value, the entity shall determine the amount that is accumulated in a separate component of net assets/equity by reference to the lower of the cumulative change in fair value of:

(i) The actual time value; and

(ii) The aligned time value.

Any remainder of the change in fair value of the actual time value shall be recognized in surplus or deficit.

Accounting for the Forward Element of Forward Contracts and Foreign Currency Basis Spreads of Financial Instruments

AG327. A forward contract can be considered as being related to a time period because its forward element represents charges for a period of time (which is the tenor for which it is determined). However, the relevant aspect for the purpose of assessing whether a hedging instrument hedges a transaction or time-period related hedged item are the characteristics of that hedged item, including how and when it affects surplus or deficit. Hence, an entity shall assess the type of hedged item (see paragraphs 144(a) and 145) on the basis of the nature of the hedged item (regardless of whether the hedging relationship is a cash flow hedge or a fair value hedge):

(a) The forward element of a forward contract relates to a transaction related hedged item if the nature of the hedged item is a transaction for which the forward element has the character of costs of that transaction. An example is when the forward element relates to a hedged item that results in the recognition of an item whose initial measurement includes transaction costs (for example, an entity hedges an inventory purchase denominated in a foreign currency, whether it is a forecast transaction or a firm commitment, against foreign currency risk and includes the transaction costs in the initial measurement of the inventory). As a consequence of including the forward element in the initial measurement of the particular hedged item, the forward element affects surplus or deficit at the same time as that hedged item. Similarly, an entity that hedges a sale of a commodity denominated in a foreign currency against foreign currency risk, whether it is a forecast transaction or a firm commitment, would include the forward element as part of the cost that is related to that sale (hence, the forward element would be recognized in surplus or deficit in the same period as the revenue from the hedged sale).

(b) The forward element of a forward contract relates to a time-period related hedged item if the nature of the hedged item is such that the forward element has the character of a cost for obtaining protection against a risk over a particular period of time (but the hedged item does not result in a transaction that involves the notion of a transaction cost in accordance with (a)). For example, if commodity inventory is hedged against changes in fair value for six months using a commodity forward contract with a corresponding life, the forward element of the forward contract would be allocated to surplus or deficit

(i.e., amortized on a systematic and rational basis) over that six-month period. Another example is a hedge of a net investment in a foreign operation that is hedged for 18 months using a foreign-exchange forward contract, which would result in allocating the forward element of the forward contract over that 18-month period.

AG328. The characteristics of the hedged item, including how and when the hedged item affects surplus or deficit, also affect the period over which the forward element of a forward contract that hedges a time-period related hedged item is amortized, which is over the period to which the forward element relates. For example, if a forward contract hedges the exposure to variability in three-month interest rates for a three-month period that starts in six months' time, the forward element is amortized during the period that spans months seven to nine.

AG329. The accounting for the forward element of a forward contract in accordance with paragraph 145 also applies if, at the date on which the forward contract is designated as a hedging instrument, the forward element is nil. In that case, an entity shall recognize any fair value changes attributable to the forward element in net assets/equity, even though the cumulative fair value change attributable to the forward element over the total period of the hedging relationship is nil. Hence, if the forward element of a forward contract relates to:

(a) A transaction related hedged item, the amount in respect of the forward element at the end of the hedging relationship that adjusts the hedged item or that is reclassified to surplus or deficit (see paragraphs 144(b) and 145) would be nil.

(b) A time-period related hedged item, the amortization amount related to the forward element is nil.

AG330. The accounting for the forward element of forward contracts in accordance with paragraph 145 applies only to the extent that the forward element relates to the hedged item (aligned forward element). The forward element of a forward contract relates to the hedged item if the critical terms of the forward contract (such as the nominal amount, life and underlying) are aligned with the hedged item. Hence, if the critical terms of the forward contract and the hedged item are not fully aligned, an entity shall determine the aligned forward element, i.e., how much of the forward element included in the forward contract (actual forward element) relates to the hedged item (and therefore should be treated in accordance with paragraph 145). An entity determines the aligned forward element using the valuation of the forward contract that would have critical terms that perfectly match the hedged item.

AG331. If the actual forward element and the aligned forward element differ, an entity shall determine the amount that is accumulated in a separate component of net assets/equity in accordance with paragraph 145 as follows:

(a) If, at inception of the hedging relationship, the absolute amount of the actual forward element is higher than that of the aligned forward element the entity shall:

(i) Determine the amount that is accumulated in a separate component of net assets/equity on the basis of the aligned forward element; and

(ii) Account for the differences in the fair value changes between the two forward elements in surplus or deficit.

(b) If, at inception of the hedging relationship, the absolute amount of the actual forward element is lower than that of the aligned forward element, the entity shall determine the amount that is accumulated in a separate component of net assets/equity by reference to the lower of the cumulative change in fair value of:

(i) The absolute amount of the actual forward element; and

(ii) The absolute amount of the aligned forward element.

Any remainder of the change in fair value of the actual forward element shall be recognized in surplus or deficit.

AG332. When an entity separates the foreign currency basis spread from a financial instrument and excludes it from the designation of that financial instrument as the hedging instrument (see paragraph 119(b)), the application guidance in paragraphs AG327–AG331 applies to the foreign currency basis spread in the same manner as it is applied to the forward element of a forward contract.

Hedge of a Group of Items

Hedge of a Net Position

Eligibility for Hedge Accounting and Designation of a Net Position

AG333. A net position is eligible for hedge accounting only if an entity hedges on a net basis for risk management purposes. Whether an entity hedges in this way is a matter of fact (not merely of assertion or documentation). Hence, an entity cannot apply hedge accounting on a net basis solely to achieve a particular accounting outcome if that would not reflect its risk management approach. Net position hedging must form part of an established risk management strategy. Normally this would be approved by key management personnel as defined in IPSAS 20.

AG334. For example, Entity A, whose functional currency is its local currency, has a firm commitment to pay FC150,000 for advertising expenses in nine months' time and a firm commitment to sell finished goods for FC150,000 in 15 months' time. Entity A enters into a foreign currency derivative that settles in nine months' time under which it receives FC100 and pays CU70. Entity A has no other exposures to FC. Entity A does not manage foreign currency risk on a net basis. Hence, Entity A cannot apply hedge accounting for a hedging relationship between the foreign currency derivative and a net position of FC100 (consisting of FC150,000 of the firm purchase commitment—i.e., advertising services—and FC149,900 (of the FC150,000) of the firm sale commitment) for a nine-month period.

AG335. If Entity A did manage foreign currency risk on a net basis and did not enter into the foreign currency derivative (because it increases its foreign currency risk exposure instead of reducing it), then the entity would be in a natural hedged position for nine months. Normally, this hedged position would not be reflected in the financial statements because the transactions are recognized in different reporting periods in the future. The nil net position would be eligible for hedge accounting only if the conditions in paragraph 151 are met.

AG336. When a group of items that constitute a net position is designated as a hedged item, an entity shall designate the overall group of items that includes the items that can make up the net position. An entity is not permitted to designate a non-specific abstract amount of a net position. For example, an entity has a group of firm sale commitments in nine months' time for FC100 and a group of firm purchase commitments in 18 months' time for FC120. The entity cannot designate an abstract amount of a net position up to FC20. Instead, it must designate a gross amount of purchases and a gross amount of sales that together give rise to the hedged net position. An entity shall designate gross positions that give rise to the net position so that the entity is able to comply with the requirements for the accounting for qualifying hedging relationships.

Application of the Hedge Effectiveness Requirements to a Hedge of a Net Position

AG337. When an entity determines whether the hedge effectiveness requirements of paragraph 129(c) are met when it hedges a net position, it shall consider the changes in the value of the items in the net position that have a similar effect as the hedging instrument in conjunction with the fair value change on the hedging instrument. For example, an entity has a group of firm sale commitments in nine months' time for FC100 and a group of firm purchase commitments in 18 months' time for FC120. It hedges the foreign currency risk of the net

position of FC20 using a forward exchange contract for FC20. When determining whether the hedge effectiveness requirements of paragraph 129(c)are met, the entity shall consider the relationship between:

(a) The fair value change on the forward exchange contract together with the foreign currency risk related changes in the value of the firm sale commitments; and

(b) The foreign currency risk related changes in the value of the firm purchase commitments.

AG338. Similarly, if in the example in paragraph AG337 the entity had a nil net position it would consider the relationship between the foreign currency risk related changes in the value of the firm sale commitments and the foreign currency risk related changes in the value of the firm purchase commitments when determining whether the hedge effectiveness requirements of paragraph 129(c) are met.

Cash Flow Hedges that Constitute a Net Position

AG339. When an entity hedges a group of items with offsetting risk positions (i.e., a net position), the eligibility for hedge accounting depends on the type of hedge. If the hedge is a fair value hedge, then the net position may be eligible as a hedged item. If, however, the hedge is a cash flow hedge, then the net position can only be eligible as a hedged item if it is a hedge of foreign currency risk and the designation of that net position specifies the reporting period in which the forecast transactions are expected to affect surplus or deficit and also specifies their nature and volume.

AG340. For example, an entity has a net position that consists of a bottom layer of FC100 of sales and a bottom layer of FC150 of purchases. Both sales and purchases are denominated in the same foreign currency. In order to sufficiently specify the designation of the hedged net position, the entity specifies in the original documentation of the hedging relationship that sales can be of Product A or Product B and purchases can be of Machinery Type A, Machinery Type B and Raw Material A. The entity also specifies the volumes of the transactions by each nature. The entity documents that the bottom layer of sales (FC100) is made up of a forecast sales volume of the first FC70 of Product A and the first FC30 of Product B. If those sales volumes are expected to affect surplus or deficit in different reporting periods, the entity would include that in the documentation, for example, the first FC70 from sales of Product A that are expected to affect surplus or deficit in the first reporting period and the first FC30 from sales of Product B that are expected to affect surplus or deficit in the second reporting period. The entity also documents that the bottom layer of the purchases (FC150) is made up of purchases of the first FC60 of Machinery Type A, the first FC40 of Machinery Type B and the first FC50 of Raw Material A. If those purchase volumes are expected to affect surplus or deficit in different reporting periods, the entity would include in the documentation a disaggregation of the purchase volumes by the reporting periods in which they are expected to affect surplus or deficit (similarly to how it documents the sales volumes). For example, the forecast transaction would be specified as:

(a) The first FC60 of purchases of Machinery Type A that are expected to affect surplus or deficit from the third reporting period over the next ten reporting periods;

(b) The first FC40 of purchases of Machinery Type B that are expected to affect surplus or deficit from the fourth reporting period over the next 20 reporting periods; and

(c) The first FC50 of purchases of Raw Material A that are expected to be received in the third reporting period and sold, i.e., affect surplus or deficit, in that and the next reporting period.

Specifying the nature of the forecast transaction volumes would include aspects such as the depreciation pattern for items of property, plant and equipment of the same kind, if the nature of those items is such that the depreciation pattern could vary depending on how the entity uses those items. For example, if the entity uses items of Machinery Type A in two different production processes that result in straight-line depreciation over ten reporting periods and the units of production method respectively, its documentation of the forecast

purchase volume for Machinery Type A would disaggregate that volume by which of those depreciation patterns will apply.

AG341. For a cash flow hedge of a net position, the amounts determined in accordance with paragraph 140 shall include the changes in the value of the items in the net position that have a similar effect as the hedging instrument in conjunction with the fair value change on the hedging instrument. However, the changes in the value of the items in the net position that have a similar effect as the hedging instrument are recognized only once the transactions that they relate to are recognized, such as when a forecast sale is recognized as revenue. For example, an entity has a group of highly probable forecast sales in nine months' time for FC100 and a group of highly probable forecast purchases in 18 months' time for FC120. It hedges the foreign currency risk of the net position of FC20 using a forward exchange contract for FC20. When determining the amounts that are recognized in the cash flow hedge reserve in accordance with paragraph 140(a)–140(b), the entity compares:

(a) The fair value change on the forward exchange contract together with the foreign currency risk related changes in the value of the highly probable forecast sales; with

(b) The foreign currency risk related changes in the value of the highly probable forecast purchases.

However, the entity recognizes only amounts related to the forward exchange contract until the highly probable forecast sales transactions are recognized in the financial statements, at which time the gains or losses on those forecast transactions are recognized (i.e., the change in the value attributable to the change in the foreign exchange rate between the designation of the hedging relationship and the recognition of revenue).

AG342. Similarly, if in the example the entity had a nil net position it would compare the foreign currency risk related changes in the value of the highly probable forecast sales with the foreign currency risk related changes in the value of the highly probable forecast purchases. However, those amounts are recognized only once the related forecast transactions are recognized in the financial statements.

Layers of Groups of Items Designated as the Hedged Item

AG343. For the same reasons noted in paragraph AG268, designating layer components of groups of existing items requires the specific identification of the nominal amount of the group of items from which the hedged layer component is defined.

AG344. A hedging relationship can include layers from several different groups of items. For example, in a hedge of a net position of a group of assets and a group of liabilities, the hedging relationship can comprise, in combination, a layer component of the group of assets and a layer component of the group of liabilities.

Presentation of Hedging Instrument Gains or Losses

AG345. If items are hedged together as a group in a cash flow hedge, they might affect different line items in the statement of surplus or deficit and net assets/equity. The presentation of hedging gains or losses in that statement depends on the group of items.

AG346. If the group of items does not have any offsetting risk positions (for example, a group of foreign currency expenses that affect different line items in the statement of financial performance and the statement of changes in net assets/equity that are hedged for foreign currency risk) then the reclassified hedging instrument gains or losses shall be apportioned to the line items affected by the hedged items. This apportionment shall be done on a systematic and rational basis and shall not result in the grossing up of the net gains or losses arising from a single hedging instrument.

AG347. If the group of items does have offsetting risk positions (for example, a group of sales and expenses denominated in a foreign currency hedged together for foreign currency risk) then an entity shall present the

hedging gains or losses in a separate line item in the statement of financial performance and the statement of changes in net assets/equity. Consider, for example, a hedge of the foreign currency risk of a net position of foreign currency sales of FC100 and foreign currency expenses of FC80 using a forward exchange contract for FC20. The gain or loss on the forward exchange contract that is reclassified from the cash flow hedge reserve to surplus or deficit (when the net position affects surplus or deficit) shall be presented in a separate line item from the hedged sales and expenses. Moreover, if the sales occur in an earlier period than the expenses, the sales revenue is still measured at the spot exchange rate in accordance with IPSAS 4. The related hedging gain or loss is presented in a separate line item, so that surplus or deficit reflects the effect of hedging the net position, with a corresponding adjustment to the cash flow hedge reserve. When the hedged expenses affect surplus or deficit in a later period, the hedging gain or loss previously recognized in the cash flow hedge reserve on the sales is reclassified to surplus or deficit and presented as a separate line item from those that include the hedged expenses, which are measured at the spot exchange rate in accordance with IPSAS 4.

AG348. For some types of fair value hedges, the objective of the hedge is not primarily to offset the fair value change of the hedged item but instead to transform the cash flows of the hedged item. For example, an entity hedges the fair value interest rate risk of a fixed-rate debt instrument using an interest rate swap. The entity's hedge objective is to transform the fixed-interest cash flows into floating interest cash flows. This objective is reflected in the accounting for the hedging relationship by accruing the net interest accrual on the interest rate swap in surplus or deficit. In the case of a hedge of a net position (for example, a net position of a fixed-rate asset and a fixed-rate liability), this net interest accrual must be presented in a separate line item in the statement of financial performance and the statement of changes in net assets/equity. This is to avoid the grossing up of a single instrument's net gains or losses into offsetting gross amounts and recognizing them in different line items (for example, this avoids grossing up a net interest receipt on a single interest rate swap into gross interest revenue and gross interest expense).

Effective Date and Transition

Transition

Financial Assets Held for Trading

AG349. At the date of initial application of this Standard, an entity must determine whether the objective of the entity's management model for managing any of its financial assets meets the condition in paragraph 40(a) or the condition in paragraph 41(a) or if a financial asset is eligible for the election in paragraph 106. For that purpose, an entity shall determine whether financial assets meet the definition of held for trading as if the entity had purchased the assets at the date of initial application.

Impairment

AG350. On transition, an entity should seek to approximate the credit risk on initial recognition by considering all reasonable and supportable information that is available without undue cost or effort. An entity is not required to undertake an exhaustive search for information when determining, at the date of transition, whether there have been significant increases in credit risk since initial recognition. If an entity is unable to make this determination without undue cost or effort paragraph 178 applies.

AG351. In order to determine the loss allowance on financial instruments initially recognized (or loan commitments or financial guarantee contracts to which the entity became a party to the contract) prior to the date of initial application, both on transition and until the derecognition of those items an entity shall consider information that is relevant in determining or approximating the credit risk at initial recognition. In order to determine or approximate the initial credit risk, an entity may consider internal and external information, including portfolio information, in accordance with paragraphs AG165–AG170.

AG352. An entity with little historical information may use information from internal reports and statistics (that may have been generated when deciding whether to launch a new product), information about similar products or peer group experience for comparable financial instruments, if relevant.

Appendix B – Hedges of a Net Investment in a Foreign Operation

This Appendix is an integral part of IPSAS 41.

Introduction

B1. Many reporting entities have investments in foreign operations (as defined in IPSAS 4, paragraph 10). Such foreign operations may be controlled entities, associates, joint ventures or branches. IPSAS 4 requires an entity to determine the functional currency of each of its foreign operations as the currency of the primary economic environment of that operation. When translating the results and financial position of a foreign operation into a presentation currency, the entity is required to recognize foreign exchange differences directly in net assets/equity until it disposes of the foreign operation.

B2. Hedge accounting of the foreign currency risk arising from a net investment in a foreign operation will apply only when the net assets of that foreign operation are included in the financial statements. This will be the case for consolidated financial statements, financial statements in which investments such as associates or joint ventures are accounted for using the equity method and financial statements that include a branch or joint operations as defined in IPSAS 37. The item being hedged with respect to the foreign currency risk arising from the net investment in a foreign operation may be an amount of net assets equal to or less than the carrying amount of the net assets of the foreign operation.

B3. IPSAS 41 requires the designation of an eligible hedged item and eligible hedging instruments in a hedge accounting relationship. If there is a designated hedging relationship, in the case of a net investment hedge, the gain or loss on the hedging instrument that is determined to be an effective hedge of the net investment is recognized directly in net assets/equity and is included with the foreign exchange differences arising on translation of the results and financial position of the foreign operation.

B4. This Appendix applies to an entity that hedges the foreign currency risk arising from its net investments in foreign operations and wishes to qualify for hedge accounting in accordance with IPSAS 41. It should not be applied by analogy to other types of hedge accounting. This Appendix refers to such an entity as a controlling entity and to the financial statements in which the net assets of foreign operations are included as consolidated financial statements. All references to a controlling entity apply equally to an entity that has a net investment in a foreign operation that is a joint venture, an associate or a branch.

B5. This Appendix provides guidance on:

(a) Identifying the foreign currency risks that qualify as a hedged risk in the hedge of a net investment in a foreign operation, given that an entity with many foreign operations may be exposed to a number of foreign currency risks. It specifically addresses:

(i) Whether the controlling entity may designate as a hedged risk only the foreign exchange differences arising from a difference between the functional currencies of the controlling entity and its foreign operation, or whether it may also designate as the hedged risk the foreign exchange differences arising from the difference between the presentation currency of the controlling entity’s consolidated financial statements and the functional currency of the foreign operation; and

(ii) If the controlling entity holds the foreign operation indirectly, whether the hedged risk may include only the foreign exchange differences arising from differences in functional currencies between the foreign operation and its immediate controlling entity, or whether the hedged risk may also include any foreign exchange differences between the functional currency of the foreign

operation and any intermediate or ultimate controlling entity (i.e., whether the fact that the net investment in the foreign operation is held through an intermediate controlling entity affects the economic risk to the ultimate controlling entity).

(b) Where in an economic entity the hedging instrument can be held. It specifically addresses:

(i) IPSAS 41 allows an entity to designate either a derivative or a non-derivative financial instrument (or a combination of derivative and non-derivative financial instruments) as hedging instruments for foreign currency risk. This Appendix addresses whether the nature of the hedging instrument (derivative or non-derivative) or the method of consolidation affects the assessment of hedge effectiveness.

(ii) This Appendix also addresses where, within an economic entity, hedging instruments that are hedges of a net investment in a foreign operation can be held to qualify for hedge accounting i.e., whether a qualifying hedge accounting relationship can be established only if the entity hedging its net investment is a party to the hedging instrument or whether any entity within the economic entity, regardless of its functional currency, can hold the hedging instrument.

(c) How an entity should determine what amount of the gain or loss recognized in net assets/equity should be recognized directly in surplus or deficit for both the hedging instrument and the hedged item as IPSAS 4 and IPSAS 41 require cumulative amounts recognized directly in net assets/equity relating to both the foreign exchange differences arising on translation of the results and financial position of the foreign operation and the gain or loss on the hedging instrument that is determined to be an effective hedge of the net investment to be recognized directly when the controlling entity disposes of the foreign operation. It specifically addresses:

(i) When a foreign operation that was hedged is disposed of, what amounts from the controlling entity's foreign currency translation reserve in respect of the hedging instrument and of that foreign operation should be recognized in surplus or deficit in the controlling entity's consolidated financial statements; and

(ii) Whether the method of consolidation affects the determination of the amounts to be recognized in surplus or deficit.

Application of IPSAS 41 to Hedges of a Net Investment in a Foreign Operation

Nature of the Hedged Risk and Amount of the Hedged Item for which a Hedging Relationship may be Designated

B6. Hedge accounting may be applied only to the foreign exchange differences arising between the functional currency of the foreign operation and the controlling entity's functional currency.

B7. In a hedge of the foreign currency risks arising from a net investment in a foreign operation, the hedged item can be an amount of net assets equal to or less than the carrying amount of the net assets of the foreign operation in the consolidated financial statements of the controlling entity. The carrying amount of the net assets of a foreign operation that may be designated as the hedged item in the consolidated financial statements of a controlling entity depends on whether any lower level controlling entity of the foreign operation has applied hedge accounting for all or part of the net assets of that foreign operation and that accounting has been maintained in the controlling entity's consolidated financial statements.

B8. The hedged risk may be designated as the foreign currency exposure arising between the functional currency of the foreign operation and the functional currency of any controlling entity (the immediate, intermediate or ultimate controlling entity) of that foreign operation. The fact that the net investment is held through an intermediate controlling entity does not affect the nature of the economic risk arising from the foreign currency exposure to the ultimate controlling entity.

B9. An exposure to foreign currency risk arising from a net investment in a foreign operation may qualify for hedge accounting only once in the consolidated financial statements. Therefore, if the same net assets of a foreign operation are hedged by more than one controlling entity within the economic entity (e.g., both a direct and an indirect controlling entity) for the same risk, only one hedging relationship will qualify for hedge accounting in the consolidated financial statements of the ultimate controlling entity. A hedging relationship designated by one controlling entity in its consolidated financial statements need not be maintained by another higher level controlling entity. However, if it is not maintained by the higher level controlling entity, the hedge accounting applied by the lower level controlling entity must be reversed before the higher level controlling entity's hedge accounting is recognized.

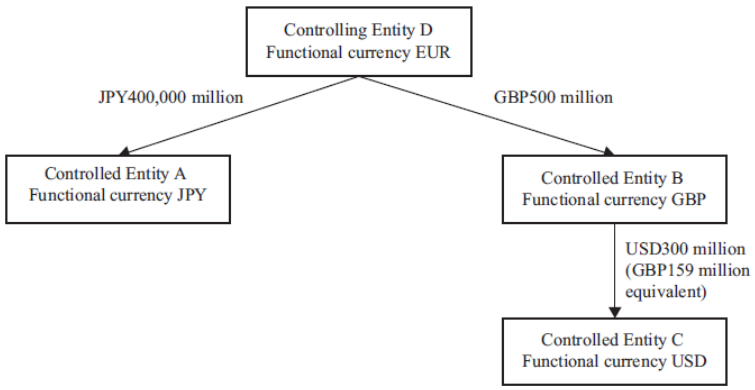
Where the Hedging Instrument can be Held

B10. A derivative or a non-derivative instrument (or a combination of derivative and non-derivative instruments) may be designated as a hedging instrument in a hedge of a net investment in a foreign operation. The hedging instrument(s) may be held by any entity or entities within the economic entity, as long as the designation, documentation and effectiveness requirements of IPSAS 41 paragraph 129 that relate to a net investment hedge are satisfied. In particular, the hedging strategy of the economic entity should be clearly documented because of the possibility of different designations at different levels of the economic entity.

B11. For the purpose of assessing effectiveness, the change in value of the hedging instrument in respect of foreign exchange risk is computed by reference to the functional currency of the controlling entity against whose functional currency the hedged risk is measured, in accordance with the hedge accounting documentation. Depending on where the hedging instrument is held, in the absence of hedge accounting the total change in value might be recognized in surplus or deficit, directly in net assets/equity, or both. However, the assessment of effectiveness is not affected by whether the change in value of the hedging instrument is recognized in surplus or deficit or directly in net assets/equity. As part of the application of hedge accounting, the total effective portion of the change is included directly in net assets/equity. The assessment of effectiveness is not affected by whether the hedging instrument is a derivative or a non-derivative instrument or by the method of consolidation.

Disposal of a Hedged Foreign Operation

B12. When a foreign operation that was hedged is disposed of, the amount reclassified to surplus or deficit from the foreign currency translation reserve in the consolidated financial statements of the controlling entity in respect of the hedging instrument is the amount that IPSAS 41 paragraph 143 requires to be identified. That amount is the cumulative gain or loss on the hedging instrument that was determined to be an effective hedge.



B13. The amount recognized in surplus or deficit upon transfer from the foreign currency translation reserve in the consolidated financial statements of a controlling entity in respect of the net investment in that foreign operation in accordance with IPSAS 4 paragraph 57 is the amount included in that controlling entity's foreign currency translation reserve in respect of that foreign operation. In the ultimate controlling entity's consolidated financial statements, the aggregate net amount recognized in the foreign currency translation reserve in respect of all foreign operations is not affected by the consolidation method. However, whether the ultimate controlling entity uses the direct or the step-by-step method of consolidation, may affect the amount included in its foreign currency translation reserve in respect of an individual foreign operation.

B14. The direct method is the method of consolidation in which the financial statements of the foreign operation are translated directly into the functional currency of the ultimate controlling entity. The step-by-step method is the method of consolidation in which the financial statements of the foreign operation are first translated into the functional currency of any intermediate controlling entity(ies) and then translated into the functional currency of the ultimate controlling entity (or the presentation currency if different).

B15. The use of the step-by-step method of consolidation may result in a different amount being recognized in surplus or deficit from that used to determine hedge effectiveness. This difference may be eliminated by determining the amount relating to that foreign operation that would have arisen if the direct method of consolidation had been used. Making this adjustment is not required by IPSAS 4. However, it is an accounting policy choice that should be followed consistently for all net investments.

Example

B16. The following example illustrates the application of the preceding paragraphs using the entity structure illustrated below. In all cases the hedging relationships described would be tested for effectiveness in accordance with IPSAS 41, although this testing is not discussed. Controlling Entity D, being the ultimate controlling entity, presents its consolidated financial statements in its functional currency of euro (EUR). Each of the controlled entities i.e., Controlled Entity A, Controlled Entity B and Controlled Entity C, is wholly owned. Controlling Entity D's £500 million net investment in Controlled Entity B (functional currency pounds sterling (GBP)) includes the £159 million equivalent of Controlled Entity B's US$300 million net investment in Controlled Entity C (functional currency US dollars (USD)). In other words, Controlled Entity B's net assets other than its investment in Controlled Entity C are £341 million.

Nature of Hedged Risk for which a Hedging Relationship may be Designated (paragraphs B6–B9)

B17. Controlling Entity D can hedge its net investment in each of Controlled Entities A, B and C for the foreign exchange risk between their respective functional currencies (Japanese yen (JPY), pounds sterling and US dollars) and euro. In addition, Controlling Entity D can hedge the USD/GBP foreign exchange risk between the functional currencies of Controlled Entity B and Controlled Entity C. In its consolidated financial statements, Controlled Entity B can hedge its net investment in Controlled Entity C for the foreign exchange risk between their functional currencies of US dollars and pounds sterling. In the following examples the designated risk is the spot foreign exchange risk because the hedging instruments are not derivatives. If the hedging instruments were forward contracts, Controlling Entity D could designate the forward foreign exchange risk.

Amount of Hedged Item for which a Hedging Relationship may be Designated (paragraphs B6–B9)

B18. Controlling Entity D wishes to hedge the foreign exchange risk from its net investment in Controlled Entity C. Assume that Controlled Entity A has an external borrowing of US$300 million. The net assets of Controlled Entity A at the start of the reporting period are ¥400,000 million including the proceeds of the external borrowing of US$300 million.

B19. The hedged item can be an amount of net assets equal to or less than the carrying amount of Controlling Entity D's net investment in Controlled Entity C (US$300 million) in its consolidated financial statements. In

its consolidated financial statements Controlling Entity D can designate the US$300 million external borrowing in Controlled Entity A as a hedge of the EUR/USD spot foreign exchange risk associated with its net investment in the US$300 million net assets of Controlled Entity C. In this case, both the EUR/USD foreign exchange difference on the US$300 million external borrowing in Controlled Entity A and the EUR/USD foreign exchange difference on the US$300 million net investment in Controlled Entity C are included in the foreign currency translation reserve in Controlling Entity D's consolidated financial statements after the application of hedge accounting.

B20. In the absence of hedge accounting, the total USD/EUR foreign exchange difference on the US$300 million external borrowing in Controlled Entity A would be recognized in Controlling Entity D's consolidated financial statements as follows:

- USD/JPY spot foreign exchange rate change, translated to euro, in surplus or deficit; and
- JPY/EUR spot foreign exchange rate change directly in net assets/equity.

Instead of the designation in paragraph B19, in its consolidated financial statements Controlling Entity D can designate the US$300 million external borrowing in Controlled Entity A as a hedge of the GBP/USD spot foreign exchange risk between Controlled Entity C and Controlled Entity B. In this case, the total USD/EUR foreign exchange difference on the US$300 million external borrowing in Entity A would instead be recognized in Controlled Entity D's consolidated financial statements as follows:

- The GBP/USD spot foreign exchange rate change in the foreign currency translation reserve relating to Controlled Entity C;
- GBP/JPY spot foreign exchange rate change, translated to euro, in surplus or deficit; and
- JPY/EUR spot foreign exchange rate change directly in net assets/equity.

B21. Controlling Entity D cannot designate the US$300 million external borrowing in Controlled Entity A as a hedge of both the EUR/USD spot foreign exchange risk and the GBP/USD spot foreign exchange risk in its consolidated financial statements. A single hedging instrument can hedge the same designated risk only once. Controlled Entity B cannot apply hedge accounting in its consolidated financial statements because the hedging instrument is held outside the economic entity comprising Controlled Entity B and Controlled Entity C.

Where in an Economic Entity can the Hedging Instrument be Held (paragraphs B10 and B11)?

B22. As noted in paragraph B20, the total change in value in respect of foreign exchange risk of the US$300 million external borrowing in Controlled Entity A would be recorded in both surplus or deficit (USD/JPY spot risk) and directly in net assets/equity (EUR/JPY spot risk) in Controlling Entity D's consolidated financial statements in the absence of hedge accounting. Both amounts are included for the purpose of assessing the effectiveness of the hedge designated in paragraph B19 because the change in value of both the hedging instrument and the hedged item are computed by reference to the euro functional currency of Controlling Entity D against the US dollar functional currency of Controlled Entity C, in accordance with the hedge documentation. The method of consolidation (i.e., direct method or step-by-step method) does not affect the assessment of the effectiveness of the hedge.

Amounts Recognized in Surplus or Deficit on Disposal of a Foreign Operation (paragraphs B12 and B13)

B23. When Controlled Entity C is disposed of, the amounts are recognized in surplus or deficit in Controlling Entity D's consolidated financial statements upon transfer from its foreign currency translation reserve (FCTR) are:

(a) In respect of the US$300 million external borrowing of Controlled Entity A, the amount that IPSAS 41 requires to be identified, i.e., the total change in value in respect of foreign exchange risk that was recognized directly in net assets/equity as the effective portion of the hedge; and

(b) In respect of the US$300 million net investment in Controlled Entity C, the amount determined by the entity's consolidation method. If Controlling Entity D uses the direct method, its FCTR in respect of Controlled Entity C will be determined directly by the EUR/USD foreign exchange rate. If Controlling Entity D uses the step-by-step method, its FCTR in respect of Controlled Entity C will be determined by the FCTR recognized by Controlled Entity B reflecting the GBP/USD foreign exchange rate, translated to Controlling Entity D's functional currency using the EUR/GBP foreign exchange rate. Controlling Entity D's use of the step-by-step method of consolidation in prior periods does not require it to or preclude it from determining the amount of FCTR to be recognized in surplus or deficit when it disposes of Controlled Entity C to be the amount that it would have recognized if it had always used the direct method, depending on its accounting policy.

Hedging More Than One Foreign Operation (paragraphs B7, B9, and B11)

B24. The following examples illustrate that in the consolidated financial statements of Controlling Entity D, the risk that can be hedged is always the risk between its functional currency (euro) and the functional currencies of Controlled Entities B and C. No matter how the hedges are designated, the maximum amounts that can be effective hedges to be included in the foreign currency translation reserve in Controlling Entity D's consolidated financial statements when both foreign operations are hedged are US$300 million for EUR/USD risk and £341 million for EUR/GBP risk. Other changes in value due to changes in foreign exchange rates are included in Controlling Entity D's consolidated surplus or deficit. Of course, it would be possible for Controlling Entity D to designate US$300 million only for changes in the USD/GBP spot foreign exchange rate or £500 million only for changes in the GBP/EUR spot foreign exchange rate.

Holds Both USD and GBP Hedging Instruments

B25. Controlling Entity D may wish to hedge the foreign exchange risk in relation to its net investment in Controlled Entity B as well as that in relation to Controlled Entity C. Assume that Controlling Entity D holds suitable hedging instruments denominated in US dollars and pounds sterling that it could designate as hedges of its net investments in Controlled Entity B and Controlled Entity C. The designations Controlling Entity D can make in its consolidated financial statements include, but are not limited to, the following:

(a) US$300 million hedging instrument designated as a hedge of the US$300 million of net investment in Controlled Entity C with the risk being the spot foreign exchange exposure (EUR/USD) between Controlling Entity D and Controlled Entity C and up to £341 million hedging instrument designated as a hedge of £341 million of the net investment in Controlled Entity B with the risk being the spot foreign exchange exposure (EUR/GBP) between Controlling Entity D and Controlled Entity B.

(b) US$300 million hedging instrument designated as a hedge of the US$300 million of net investment in Controlled Entity C with the risk being the spot foreign exchange exposure (GBP/USD) between Controlled Entity B and Controlled Entity C and up to £500 million hedging instrument designated as a hedge of £500 million of the net investment in Controlled Entity B with the risk being the spot foreign exchange exposure (EUR/GBP) between Controlling Entity D and Controlled Entity B.

B26. The EUR/USD risk from Controlling Entity D's net investment in Controlled Entity C is a different risk from the EUR/GBP risk from Controlling Entity D's net investment in Controlled Entity B. However, in the case described in paragraph B25(a), by its designation of the USD hedging instrument it holds, Controlling Entity D has already fully hedged the EUR/USD risk from its net investment in Controlled Entity C. If Controlling Entity D also designated a GBP instrument it holds as a hedge of its £500 million net investment in Controlled Entity B, £159 million of that net investment, representing the GBP equivalent of its USD net investment in

Controlled Entity C, would be hedged twice for GBP/EUR risk in Controlling Entity D's consolidated financial statements.

B27. In the case described in paragraph B25(b), if Controlling Entity D designates the hedged risk as the spot foreign exchange exposure (GBP/USD) between Controlled Entity B and Controlled Entity C, only the GBP/USD part of the change in the value of its US$300 million hedging instrument is included in Controlling Entity D's foreign currency translation reserve relating to Controlled Entity C. The remainder of the change (equivalent to the GBP/EUR change on £159 million) is included in Controlling Entity D's consolidated surplus or deficit, as in paragraph B20. Because the designation of the USD/GBP risk between Controlled entities B and C does not include the GBP/EUR risk, Controlling Entity D is also able to designate up to £500 million of its net investment in Controlled Entity B with the risk being the spot foreign exchange exposure (GBP/EUR) between Controlling Entity D and Controlled Entity B.

Entity B Holds the USD Hedging Instrument

B28. Assume that Controlled Entity B holds US$300 million of external debt, the proceeds of which were transferred to Controlling Entity D by an inter-entity loan denominated in pounds sterling. Because both its assets and liabilities increased by £159 million, Controlled Entity B's net assets are unchanged. Controlled Entity B could designate the external debt as a hedge of the GBP/USD risk of its net investment in Controlled Entity C in its consolidated financial statements. Controlling Entity D could maintain Controlled Entity B's designation of that hedging instrument as a hedge of its US$300 million net investment in Controlled Entity C for the GBP/USD risk (see paragraph B9) and Controlling Entity D could designate the GBP hedging instrument it holds as a hedge of its entire £500 million net investment in Controlled Entity B. The first hedge, designated by Controlled Entity B, would be assessed by reference to Controlled Entity B's functional currency (pounds sterling) and the second hedge, designated by Controlling Entity D, would be assessed by reference to Controlling Entity D's functional currency (euro). In this case, only the GBP/USD risk from Controlling Entity D's net investment in Controlled Entity C has been hedged in Controlling Entity D's consolidated financial statements by the USD hedging instrument, not the entire EUR/USD risk. Therefore, the entire EUR/GBP risk from Controlling Entity D's £500 million net investment in Controlled Entity B may be hedged in the consolidated financial statements of Controlling Entity D.

B29. However, the accounting for Controlling Entity D's £159 million loan payable to Controlled Entity B must also be considered. If Controlling Entity D's loan payable is not considered part of its net investment in Controlled Entity B because it does not satisfy the conditions in IPSAS 4 paragraph 18, the GBP/EUR foreign exchange difference arising on translating it would be included in Controlling Entity D's consolidated surplus or deficit. If the £159 million loan payable to Controlled Entity B is considered part of Controlling Entity D's net investment, that net investment would be only £341 million and the amount Controlling Entity D could designate as the hedged item for GBP/EUR risk would be reduced from £500 million to £341 million accordingly.

B30. If Controlling Entity D reversed the hedging relationship designated by Controlled Entity B, Controlling Entity D could designate the US$300 million external borrowing held by Controlled Entity B as a hedge of its US$300 million net investment in Controlled Entity C for the EUR/USD risk and designate the GBP hedging instrument it holds itself as a hedge of only up to £341 million of the net investment in Controlled Entity B. In this case the effectiveness of both hedges would be computed by reference to Controlling Entity D's functional currency (euro). Consequently, both the USD/GBP change in value of the external borrowing held by Controlled Entity B and the GBP/EUR change in value of Controlling Entity D's loan payable to Controlled Entity B (equivalent to USD/EUR in total) would be included in the foreign currency translation reserve in Controlling Entity D's consolidated financial statements. Because Controlling Entity D has already fully hedged the EUR/USD risk from its net investment in Controlled Entity C, it can hedge only up to £341 million for the EUR/GBP risk of its net investment in Controlled Entity B.

Appendix C: Extinguishing Financial Liabilities with Equity Instruments

This Appendix is an integral part of IPSAS 41.

Introduction

C1. A debtor and creditor might renegotiate the terms of a financial liability with the result that the debtor extinguishes the liability fully or partially by issuing equity instruments to the creditor. These transactions are sometimes referred to as 'debt for equity swaps'.

Scope

C2. This Appendix addresses the accounting by an entity when the terms of a financial liability are renegotiated and result in the entity issuing equity instruments to a creditor of the entity to extinguish all or part of the financial liability. It does not address the accounting by the creditor.

C3. An entity shall not apply this Appendix to transactions in situations where:

(a) The creditor is also a direct or indirect shareholder and is acting in its capacity as a direct or indirect existing shareholder.

(b) The creditor and the entity are controlled by the same party or parties before and after the transaction and the substance of the transaction includes an equity distribution by, or contribution to, the entity.

(c) Extinguishing the financial liability by issuing equity shares is in accordance with the original terms of the financial liability.

C4. This Appendix addresses the following issues:

(a) Are an entity's equity instruments issued to extinguish all or part of a financial liability 'consideration paid' in accordance with paragraph 37 of IPSAS 41?

(b) How should an entity initially measure the equity instruments issued to extinguish such a financial liability?

(c) How should an entity account for any difference between the carrying amount of the financial liability extinguished and the initial measurement amount of the equity instruments issued?

Consensus

C5. The issue of an entity's equity instruments to a creditor to extinguish all or part of a financial liability is consideration paid in accordance with paragraph 37 of IPSAS 41. An entity shall remove a financial liability (or part of a financial liability) from its statement of financial position when, and only when, it is extinguished in accordance with paragraph 35 of IPSAS 41.

C6. When equity instruments issued to a creditor to extinguish all or part of a financial liability are recognized initially, an entity shall measure them at the fair value of the equity instruments issued, unless that fair value cannot be reliably measured.

C7. If the fair value of the equity instruments issued cannot be reliably measured then the equity instruments shall be measured to reflect the fair value of the financial liability extinguished. In measuring the fair value of a financial liability extinguished that includes a demand feature (e.g., a demand deposit), paragraph 68 of IPSAS 41 is not applied.

C8. If only part of the financial liability is extinguished, the entity shall assess whether some of the consideration paid relates to a modification of the terms of the liability that remains outstanding. If part of the consideration

paid does relate to a modification of the terms of the remaining part of the liability, the entity shall allocate the consideration paid between the part of the liability extinguished and the part of the liability that remains outstanding. The entity shall consider all relevant facts and circumstances relating to the transaction in making this allocation.

C9. The difference between the carrying amount of the financial liability (or part of a financial liability) extinguished, and the consideration paid, shall be recognized in surplus or deficit, in accordance with paragraph 37 of IPSAS 41. The equity instruments issued shall be recognized initially and measured at the date the financial liability (or part of that liability) is extinguished.

C10. When only part of the financial liability is extinguished, consideration shall be allocated in accordance with paragraph C8. The consideration allocated to the remaining liability shall form part of the assessment of whether the terms of that remaining liability have been substantially modified. If the remaining liability has been substantially modified, the entity shall account for the modification as the extinguishment of the original liability and the recognition of a new liability as required by paragraph 36 of IPSAS 41.

C11. An entity shall disclose a gain or loss recognized in accordance with paragraphs C9 and C10 as a separate line item in surplus or deficit or in the notes.

Appendix D

Amendments to Other IPSAS

[Deleted]

Basis for Conclusions

This Basis for Conclusions accompanies, but is not part of, IPSAS 41.

Introduction

BC1. This Basis for Conclusions summarizes the IPSASB's considerations in reaching the conclusions in IPSAS 41, *Financial Instruments*. As this Standard is based on IFRS 9, *Financial Instruments* issued by the IASB, the Basis for Conclusions outlines only those areas where IPSAS 41 departs from the main requirements of IFRS 9.

BC2. In July 2014, the IASB published the final version of IFRS 9, which brings together the classification and measurement, impairment and hedge accounting phases of the IASB's project to replace IAS 39, *Financial Instruments*. In 2016, the IPSASB commenced work on a project to update those IPSAS that dealt with accounting for financial instruments as part of the IPSASB's convergence program which aims to converge IPSAS with IFRS. The text of IPSAS 41 is based on the requirements of IFRS 9, modified as appropriate for public sector entities and to reflect the requirements of other IPSAS. This new IPSAS replaces IPSAS 29, while providing entities a transition option to continue to apply the hedge accounting requirements of IPSAS 29.

BC3. When developing IPSAS 41, the IPSASB acknowledged that there are other financial instruments and items with some financial instruments' characteristics as defined in IPSAS 41 to the public sector, and which are not addressed in IFRS 9. The IPSASB has undertaken separate projects on *Public Sector Specific Financial Instruments*, and *Revenue and Transfer Expenses*, to address:

(a) Certain transactions undertaken by monetary authorities; and

(b) Receivables and payables that arise from arrangements that are, in substance, similar to, and have the same economic effect as, financial instruments, but are not contractual in nature.

Public Sector Specific Financial Instruments

BC3A. The Public Sector Specific Financial Instruments (PSSFI) project arose because, in developing IPSAS 28, *Financial Instruments: Presentation*, IPSAS 29, *Financial Instruments: Recognition and Measurement*, and IPSAS 30, *Financial Instruments: Disclosures*, the IPSASB identified several items with characteristics that might make them public sector specific financial instruments (PSSFIs). These items were:

- Monetary gold;
- International Monetary Fund (IMF) quota subscriptions;
- IMF Special Drawing Rights (SDRs);
- Currency in circulation;
- Statutory receivables and payables;
- Concessionary loans; and
- Financial guarantee contracts.

BC3B. Of the items listed in BC3A, two public sector specific items — concessionary loans and financial guarantee contracts issued through non-exchange transactions — meet the definition of a financial instrument and thus were addressed in the application guidance in IPSAS 41. Neither statutory receivables nor payables are contractual, and so do not meet the definition of a financial instrument. The IPSASB agreed to address these instruments in a separate project.

BC3C. The IPSASB agreed to address the remaining public sector specific items in a PSSFI project. In July 2016, the IPSASB issued a Consultation Paper (CP), Public Sector Specific Financial Instruments which provided a detailed analysis of these items. This analysis included definitions, which were developed to reflect the substance of these items as well as conventions included in IPSAS and discussions by the IPSASB related to the transactions in an accounting context. The IPSASB intended for these definitions to have the same substance as guidance included in the various Government Finance Statistics manuals referenced.

BC3D. Respondents to the CP agreed that:

(a) Several of the items meet the definition of a financial instrument in IPSAS and therefore should be addressed in existing guidance; and

(b) Items that meet the IPSAS definition of a financial instrument should be accounted for in accordance with existing IPSAS accounting principles.

In considering these responses to the CP, the IPSASB concluded, where possible, that PSSFIs should be addressed in the current financial instruments standards and the scope should be retained. This eliminated the need to incorporate the detailed analysis and definitions from the CP in non-authoritative amendments to IPSAS 41 as sufficient principles exist in IPSAS 41 to account for PSSFI items.

BC3E. The IPSASB noted that additional non-authoritative guidance would help users identify these specific financial items that are (or share characteristics of) financial instruments, and developed additional implementation guidance for monetary gold, currency in circulation, and SDRs. However, the IPSASB noted IMF quota subscriptions share a number of features with those in Illustrative Example 32 in IPSAS 41 and decided that additional guidance for quota subscriptions was not required. The IPSASB concluded that the additional illustrative examples and augmented implementation guidance provide appropriate guidance for accounting for monetary gold, currency in circulation, and SDRs.

BC3F. The IPSASB issued Exposure Draft (ED) 69 in August 2019 that proposed non-authoritative amendments to IPSAS 41 to illustrate the application of IPSAS 41 to PSSFIs. These amendments included the non-authoritative guidance noted in BC3E. Respondents to the ED supported the additional non-authoritative guidance provided by the IPSASB and the amendments proposed in the ED.

BC4. In developing this Standard, the IPSASB agreed to retain the existing text of IFRS 9 wherever consistent with existing IPSAS, and provide examples and implementation guidance for certain public sector specific issues. In particular, the IPSASB noted the usefulness of the application guidance on concessionary loans and financial guarantees issued through a non-exchange transaction in IPSAS 29 and the continued need for such guidance in IPSAS 41. The IPSASB's view is that it is critical to provide non-authoritative material to support constituents in applying the principles in this Standard. Therefore the IPSASB followed a rigorous process to develop the following additional public sector examples to help with application of this Standard:

(a) Examples related to concessionary loans, including when to assess the classification (see examples 20 and 21 and implementation guidance G.1) and the impact of contingent repayment features (see implementation guidance G.2);

(b) Examples related to measurement of unquoted equity instruments, including factors to be considered in determining the fair value (see examples 23–26 and implementation guidance E.2.4 and E.2.5) and accounting for those with a non-exchange component (see examples 27 and 28 and implementation guidance G.3);

(c) Example related to accounting for equity instruments with redemption features (see example 31);

(d) Examples related to the application of the effective interest rate in calculating the amortized cost of a financial asset (see examples 32 and implementation guidance H.1).

BC5. The IPSASB also agreed to use revenue in place of income in IFRS 9, *Financial Instruments*, to be consistent with IPSAS 1, *Presentation of Financial Statements*, which uses revenue to correspond to income in the IAS/IFRS. Therefore some items recognized as revenue or expense in IPSAS 1 are net amounts. As stated in the Basis for Conclusions in IPSAS 1, the IPSAS do not include a definition of income. The term income is broader than revenue, encompassing gains in addition to revenue.

Scope

BC6. Assets and liabilities may arise out of contractual non-exchange revenue transactions. At the time this Standard was developed, the initial recognition and measurement of assets and liabilities arising out of non-exchange revenue transactions was addressed in IPSAS 23, *Revenue from Non-Exchange Transactions (Taxes and Transfers)*. IPSAS 23 did not provide requirements and guidance for the subsequent measurement or derecognition of these assets and liabilities. The IPSASB considered the interaction between this Standard and IPSAS 23 for assets and liabilities that arise out of non-exchange revenue transactions that meet the definition of financial assets and financial liabilities.

BC7. When this Standard was being developed, the IPSASB agreed that where an asset acquired in a non-exchange transaction is a financial asset, an entity:

- Initially recognized the asset using IPSAS 23; and
- Initially measured the asset using IPSAS 23 and, considers the requirements in this Standard to determine the appropriate treatment for any transaction costs incurred to acquire the asset.

As IPSAS 23 did not prescribe subsequent measurement or derecognition requirements for assets acquired in a non-exchange transaction, this Standard is applied to those assets if they are financial assets.

BC8. For liabilities, the IPSASB agreed, when developing this Standard, that liabilities arising from conditions imposed on a transfer of resources in accordance with IPSAS 23 are initially recognized and initially measured using that IPSAS, as these liabilities usually do not meet the definition of a financial liability at initial recognition (see IPSAS 28). After initial recognition, if circumstances indicate that the liability is a financial liability, an entity assesses if the liability recognized in accordance with IPSAS 23 should be derecognized and a financial liability recognized in accordance with this Standard.

BC9. At the time IPSAS 41 was finalized, the IPSASB agreed that other liabilities that arise from non-exchange revenue transactions, for example, the return of resources based on a restriction on the use of an asset, are recognized and measured in accordance with this Standard if they meet the definition of a financial liability.

Initial Measurement

BC10. When the IPSASB developed this Standard, the IPSASB acknowledged that there is an interaction between IPSAS 23 and this Standard for assets acquired through a non-exchange transaction that also meet the definition of a financial asset. IPSAS 23 required that assets acquired in a non-exchange revenue transaction were measured initially at fair value. This Standard requires financial assets to be measured initially at fair value, plus transaction costs, if the asset is not subsequently measured at fair value through surplus or deficit. The two measurement approaches are broadly consistent, except for the treatment of transaction costs.

BC11. At that time, the IPSASB concluded that it would be inappropriate for financial assets arising from non-exchange transactions to be measured differently from those arising from exchange transactions. Consequently, the IPSASB agreed that financial assets acquired in a non-exchange transaction should be measured initially at fair value using the requirements in IPSAS 23, but that this Standard should also be considered where transaction costs are incurred to acquire the asset.

BC11A. During the development of IPSAS 45, *Property, Plant, and Equipment* and IPSAS 46, *Measurement*, the requirement in IPSAS 23 for initial measurement of financial assets received through a non-exchange transaction was clarified to reflect that these are measured at fair value.

Equity Instruments Arising from Non-Exchange Transactions

BC12. In the public sector, equity instruments are sometimes obtained with minimal cash flow expectations as a way to provide funding to another public sector entity for providing a service. The IPSASB considered the need for additional guidance similar to concessionary loans for such equity instruments acquired at non-market terms. The IPSASB agreed that there are fundamental differences between the economic substance of such arrangements compared to concessionary loans. The IPSASB also agreed that, when this Standard was developed, the guidance in IPSAS 23 and the Standard sufficiently addressed the recognition and measurement of such transactions, and additional guidance was included to provide clarity.

Sale of Future Flows Arising from a Sovereign Right

BC13. In the public sector, securitization schemes may involve a sale of future flows arising from a sovereign right, such as a right to taxation. The IPSASB agreed that it would be helpful to acknowledge that such transactions may give rise to financial liabilities and agreed to include paragraph AG33. The IPSASB noted that revenue from such transactions should be accounted for in accordance with the relevant revenue standard. The IPSASB considered whether additional application guidance to address such scenarios was required. The IPSASB concluded that sufficient guidance exists in the Standard to address the accounting for any financial instruments arising from those transactions.

Impairment

BC14. The IPSASB notes that for many public sector entities, receivables may be the only significant financial asset held. In addition, public sector entities may not have an ability to choose the counterparties they transact with because of the nature of services provided and laws or regulations requiring provision of services to all service recipients (for example, when a public utility provides water or hydro services). Under such scenarios, credit risk information at an individual counterparty level and forward looking information/forecasts may not be available without undue cost or effort. The IPSASB considered whether public sector modifications or additional guidance should be included in the Standard and concluded that the simplified approach for receivables along with practical expedients available in determining expected credit losses provide appropriate relief to the practical challenges under such scenarios. The IPSASB further acknowledges that the Standard allows for historical data and existing models be incorporated in estimating expected credit losses under such circumstances with consideration for any adjustments as needed to reflect current and forecasted conditions, as prescribed in the Standard."

Effective Interest Method

BC15. Constituents raised concerns with the IPSASB in regard to the cost/benefit of measuring financial liabilities (bonds) at amortized cost using the effective interest method. These constituents were concerned that, when transaction costs and any premium or discount on issuance are insignificant, measuring amortized cost using the effective interest rate produced similar or identical results to using the straight line method. However, the costs of applying the effective interest method were greater.

BC16. The IPSASB noted that paragraph 10 of IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*, addressed this concern. Paragraph 10 of IPSAS 3 states that:

"IPSAS set out accounting policies that the IPSASB has concluded result in financial statements containing relevant and reliable information about the transactions, other events, and conditions to which they apply. Those policies need not be applied when the effect of applying them is immaterial. However, it is inappropriate

to make, or leave uncorrected, immaterial departures from IPSAS to achieve a particular presentation of an entity's financial position, financial performance, or cash flows."

BC17. The IPSASB considered that, in instances when amortized cost calculated using the effective interest method is not materially different than an existing technique, the standards already allow for alternative approaches. The IPSASB also noted that IPSAS 1 includes similar provisions in relation to disclosures. Consequently, the IPSASB concluded that there was no cost/benefit justification for departing from the use of effective interest method in IPSAS 41.

Gold Bullion

BC18. Gold bullion does not meet the definition of a financial instrument as defined in IFRS 9. Given the proposals in its PSSFI project related to monetary gold, the IPSASB considered whether this was appropriate. The IPSASB noted that gold bullion has a wider meaning than monetary gold, and for entities that are not monetary authorities, the guidance may be appropriate. The IPSASB therefore agreed to include Implementation Guidance B.1.

Monetary Gold

BC18A. As part of the PSSFI project, the IPSASB considered accounting for gold held by monetary authorities as reserve assets that are available to them in carrying out their mandates, i.e., monetary gold. Some constituents indicated the scope of IPSAS 41 should be expanded to include monetary gold as it shares several characteristics with a financial asset. For example, monetary gold is:

(a) Readily convertible into cash;

(b) Quoted globally in US dollars;

(c) Easily traded with willing counterparties (durable, divisible and portable);

(d) Accepted as a form of payment by some central banks; and

(e) A store of wealth.

Furthermore, monetary gold can be held for:

(a) Its contribution to financial capacity because of its ability to be sold in the global liquid gold trading markets; and

(b) An indeterminate period of time, because it provides confidence in the monetary authority's financial strength and ability to carry out its activities.

BC18B. In considering the responses to the CP, the IPSASB confirmed its view that monetary gold is not a financial instrument. Although monetary gold is a highly liquid asset, there is no contractual right to receive cash or another financial asset inherent in monetary gold.

BC18C. The IPSASB also confirmed that the scope of IPSAS 41 should not be expanded. Nevertheless, the IPSASB considered whether applying the principles in IPSAS 41 to monetary gold might be appropriate under the hierarchy set out in paragraphs 9–15 of IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*.

BC18D. The IPSASB concluded that, while monetary gold shares several characteristics with a financial asset, as noted in paragraph BC18A, the hierarchy set out in IPSAS 3 requires an entity to assess all facts specific to the circumstances related to the holding of monetary gold. Should an entity account for monetary gold using principles consistent with those applied to financial assets, the IPSASB expects all classification and measurement requirements set out in IPSAS 41 to be applied.

Transition

BC19. The IPSASB noted some public sector transactions may be reclassified under IPSAS 41. The IPSASB considered whether specific transitional provisions may be required for such reclassifications. The IPSASB noted that both general and specific transition relief was included in IFRS 9 and has been adopted in IPSAS 41. This includes a specific provision that provides relief from providing comparative information. The IPSASB therefore concluded that additional relief was not required.

Originated Credit-Impaired Short-Term Receivables

BC20. As required by paragraphs 85–86, an entity includes expected credit losses over the life of a financial asset in the initial measurement of an instrument that is credit-impaired on purchase or origination. An entity is also required to include the initial expected credit losses in the estimated cash flows when calculating the credit-adjusted effective interest rate.

BC21. The IPSASB noted that public sector entities are often required to transact with other parties to provide basic services, irrespective of whether those parties can afford to pay for the services received. This means that there is a high prevalence of transactions where collectability is in doubt at the initiation of the transaction. The potential implications of introducing the requirements for purchased or originated credit-impaired transactions could therefore have a pervasive effect on public sector entities.

BC22. Given the potential implications, the Board considered the effect of including credit losses in the initial measurement of the receivable and on the recognition of revenue related to the sale of goods and services. In particular, the Board discussed whether this principle creates onerous financial reporting requirements for public sector entities that are required to enter into receivables that are originated credit-impaired.

BC23. The IPSASB took the view that the costs to apply the originated credit-impaired requirements to short-term receivables would exceed the benefit for public sector entities. This is because regardless of whether the short-term receivable is originated credit-impaired or performing, the entity must calculate the expected credit losses. As short-term receivables are due in periods not exceeding 12 months, the lifetime and 12 month expected credit losses are equal. Consequently, benefits of the information provided by applying the originated credit-impaired requirements in IPSAS 41 are not justified by the cost of identifying short-term receivables that are originated credit-impaired in a portfolio of short-term receivables arising from routine, high volume transactions integral to the day to day operations of the entity.

BC24. As a result, the Board agreed that the principles for purchased or originated credit-impaired instruments should not be applied to short-term receivables. The Board noted that while it supports a departure from IFRS 9, it is on cost/benefit grounds, rather than a disagreement with the conceptual merits of the principle.

Analyzing the Substance of Equity Instruments Arising from Non-Exchange Transactions

BC25. Constituents noted that it can be difficult to identify when an equity instrument arises from a non-exchange transaction and sought additional guidance.

BC26. When developing this Standard, the IPSASB considered that the existing requirements and guidance in IPSAS 28 and IPSAS 23 already appropriately addressed these matters. IPSAS 28 defines an equity instrument and explains how to determine whether a financial instrument is a financial liability or an equity instrument. IPSAS 23, *Revenue from Non-Exchange Transactions (Taxes and Transfers)*, paragraph 28, included examples of contributions from owners. Nevertheless, the IPSASB agreed to develop implementation guidance (paragraph G.4) to support constituents in analyzing the substance of financial instruments arising from non-exchange transactions.

Designating Hedged Items in Consolidated Financial Statements

BC27. The IPSASB acknowledged there is an interaction between IPSAS 35 and this Standard when determining which instruments can be designated as hedged items. Generally, this Standard allows assets, liabilities and firm commitments or highly probable transactions with a party external to the reporting entity to be designated as a hedged item for hedge accounting purposes. The restriction to only allow for instruments transacted with a party external to the reporting entity is necessary as transactions within the consolidated entity are eliminated in accordance with IPSAS 35.

BC28. However, in accordance with IPSAS 35, paragraphs 56 and 58, an investment entity does not consolidate its controlled entities, and a controlling entity of an investment entity shall present consolidated financial statements measuring the investments of a controlled investment entity at fair value through surplus or deficit.

BC29. The IPSASB concluded it would be inappropriate for transactions between a controlled investment entity and the investments of that controlled investment entity not to be eligible for designation as hedged items. Consequently, the IPSASB decided that hedge accounting can be applied to transactions between entities in the same economic entity in the consolidated statements of an investment entity or the consolidated statements of a controlling entity of an investment entity.

Illustrative Examples with Jurisdiction Specific Fact Patterns

BC30. Some respondents suggested that illustrative examples would be more helpful if they included jurisdiction specific characteristics. These constituents indicated that generic illustrative examples would be more useful to constituents if characteristics common among some jurisdictions were illustrated.

BC31. During the project the IPSASB developed illustrative examples based on fact patterns proposed by individual jurisdictions. This resulted in complex examples illustrating the application of multiple principles. When a constituent's fact pattern did not mirror the characteristics of the illustrative example, interpreting the application of any individual principle was challenging and was only helpful where an entity already had an understanding of how the accounting principles underlying financial instruments interact. The IPSASB concluded that such examples are unhelpful to the majority of entities.

BC32. Consequently, the IPSASB decided that each illustrative example should illustrate the application of a single principle. This will provide useful guidance to a broader range of entities and assist in understanding basic concepts. When an entity has a more sophisticated fact pattern, individual illustrative examples can be aggregated as necessary in order to determine the appropriate application of the principles.

Consistency with IFRS 9

BC33. In developing IPSAS 41, the IPSASB applied its *Process for Reviewing and Modifying IASB Documents*. Modifications to IFRS 9 were made in circumstances where public sector issues were identified that warranted a departure. As part of its development, the IPSASB debated a number of issues and whether departure was justified.

Short-Term Receivables and Payables

BC34. Consistent with the fair value measurement guidance in IPSAS 29, IPSAS 41 proposed to permit short-term receivables and payables with no stated interest rate to be measured at the original invoice amount if the effect of discounting is immaterial. This option was located in the Application Guidance in IPSAS 41. Respondents to IPSAS 41 noted that IFRS 9 has an exception to fair value measurement for certain short-term trade receivables (as defined in IFRS 15) and were concerned about what they perceived as the absence of an equivalent exception in IPSAS 41. The IPSASB decided to highlight the existence of this option by moving it to the body of the standard and locating it in a similar place to the exception for short-term

receivables in IFRS 9. The IPSASB also noted that paragraph 10 of IPSAS 3 already permits entities not to apply accounting policies set out in accordance with IPSAS when the effect of applying them is immaterial.

BC35. To maintain consistent measurement requirements, the IPSASB agreed short-term receivables and payables are measured at the original invoice amount if the effect of discounting is immaterial (see paragraph 60).

Acceptable Valuation Methodologies

BC36. IPSAS 41 requires entities to measure equity instruments at fair value. Given the public policy objectives of public sector entities, constituents expressed concerns that measuring fair value can be challenging as significant opportunity exists for investments in to be in the form of unquoted equity instruments.

BC37. Some constituents expressed concerns about whether the fair value of such investments should be determined solely in a commercial manner by reference to expected cash flows with the objective of estimating how much the investment could be sold for in an arm's length transaction or whether fair value measurement should take into account other factors, such as the service potential of the unquoted equity investment.

BC38. In considering this issue, the IPSASB developed illustrative examples 24–28 outlining various valuation techniques the public sector could apply in determining the fair value of the unquoted equity investment. These valuation techniques outlined in the examples are not an exhaustive list of valuation methodologies available.

BC39. In order to highlight that public sector entities have a wide range of valuation techniques available when determining the fair value of an unquoted equity instrument, the IPSASB developed specific implementation guidance. IG E.2.4 does not prescribe the use of a specific valuation technique, but instead encourages the use of professional judgment and the consideration of all the facts and circumstances surrounding the selection of an appropriate measurement technique.

Valuation Assumptions

BC40. Some respondents proposed adding guidance to address which inputs should be applied in fair value measurement and which assumptions should be applied in developing these inputs. Respondents highlighted challenges and complexities in determining inputs such as the prevailing market rates for a similar loan and the probability of default.

BC41. The IPSASB acknowledges measuring some financial instruments can be a challenging process and that one aspect of this challenge relates to inputs.

BC42. The IPSASB concluded that developing additional valuation guidance is beyond the scope of the Standard and consider the application of professional judgment an important aspect in measuring the fair value of financial instruments.

Fair Value at Initial Recognition does not Equal the Transaction Price

BC43. In developing this Standard, the IPSASB concluded that retaining paragraphs AG103–AG116 of IPSAS 29 was necessary in order to maintain a consistent approach to the valuation of financial instruments. This decision was reached because unlike in IFRS, where IFRS 9 directs users to IFRS 13, *Fair Value Measurement*, for guidance in measuring the fair value of a financial instrument, this option is not available as no equivalent IPSAS has been developed for IFRS 13.

Public Sector Specific Examples

BC44. Some respondents proposed that the IPSASB develop additional illustrative examples to support the application of the standard in practice. The IPSASB considered this request and agreed to develop additional illustrative examples and implementation guidance to the extent it related to an issue specific to the public

sector. The IPSASB rejected respondents' proposals for additional illustrative examples for instruments that were also prevalent in the private sector. For these instruments, the IPSASB concluded that guidance drawn from IFRS 9 was sufficient to address the concerns of respondents and no departures were warranted.

Revision of IPSAS 41 as a result of *Long-term Interests in Associates and Joint Ventures* (Amendments to IPSAS 36) and *Prepayment Features with Negative Compensation* (Amendments to IPSAS 41)

BC45. The IPSASB reviewed the revisions to IFRS 9, *Financial Instruments*, included in *Prepayment Features with Negative Compensation* (Amendments to IFRS 9), issued by the IASB in October 2017, and the IASB's rationale for making these amendments as set out in its Basis for Conclusions, and concurred that there was no public sector specific reason for not adopting the amendments.

Revision of IPSAS 41 as a result of *COVID-19: Deferral of Effective Dates*

BC46. The IPSASB published IPSAS 41, *Financial Instruments* in August 2018. At the time this Standard was finalized, the Board decided that an entity shall apply it for annual financial statements covering periods beginning on or after January 1, 2022.

BC47. In June 2020, the IPSASB discussed the effect of the COVID-19 pandemic on financial reporting. The Board noted that the pandemic has created significant pressures on the resources public sector entities might otherwise allocate to the implementation of IPSAS 41.

BC48. The Board concluded that deferral during a time of significant disruption would provide much-needed operational relief to public sector entities. Therefore, the Board decided to propose a one-year deferral of the effective date of IPSAS 41.

BC49. The Board did not propose any changes to the Standard other than the deferral of the effective date. Earlier application of the amendments will continue to be permitted.

Revision of IPSAS 41 as a result of *Improvements to IPSAS, 2021*

BC50. The IPSASB reviewed the revisions to IFRS 9, *Financial Instruments*, included in *Interest Rate Benchmark Reform* (Amendments to IFRS 9, IAS 39 and IFRS 7) issued by the IASB in September 2019, and the IASB's rationale for making these amendments as set out in its Basis for Conclusions and concurred that there was no public sector specific reason for not adopting these amendments, henceforth labeled as *Interest Rate Benchmark Reform*.

BC51. The IPSASB reviewed the revisions to IFRS 9, *Financial Instruments*, included in *Interest Rate Benchmark Reform*—Phase 2 (Amendments to IFRS 9, IAS 39, IFRS 7, IFRS 4 and IFRS 16) issued by the IASB in August 2020, and the IASB's rationale for making these amendments as set out in its Basis for Conclusions and concurred that there was no public sector specific reason for not adopting these amendments, henceforth labeled as *Interest Rate Benchmark Reform—Phase 2*.

BC52. The IPSASB reviewed the revisions to IFRS 9, *Financial Instruments, included in Annual Improvements to IFRS® Standards* (2018-2020) issued by the IASB in May 2020, and the IASB's rationale for making these amendments as set out in its Basis for Conclusions and concurred that there was no public sector specific reason for not adopting these amendments.

Revision of IPSAS 41 as a result of IPSAS 46, *Measurement*

BC53. The IPSASB issued IPSAS 46, *Measurement*, in May 2023. That Standard provides guidance on measuring assets and liabilities at fair value, which is relevant to the measuring financial instruments. Guidance specific to applying fair value to the measurement of financial instruments was added as application guidance (see paragraphs AG143A–AG143AB).

Revision of IPSAS 41 as a result of Part 3 of *Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* issued in August 2025

BC54. The IPSASB replaced the term ‘valuation techniques’ with the term ‘measurement techniques’ for consistency with the new terminology introduced in IPSAS 46, *Measurement*.

Illustrative Examples

These examples accompany, but are not part of, IPSAS 41.

Financial Liabilities at Fair Value through Surplus or Deficit

IE1. The following example illustrates the calculation that an entity might perform in accordance with paragraph AG241 of IPSAS 41.

IE2. On January 1, 20X1 an entity issues a 10-year bond with a par value of CU150,000[5] and an annual fixed coupon rate of 8 per cent, which is consistent with market rates for bonds with similar characteristics.

IE3. The entity uses LIBOR as its observable (benchmark) interest rate. At the date of inception of the bond, LIBOR is 5 per cent. At the end of the first year:

(a) LIBOR has decreased to 4.75 per cent.

(b) LIBOR has decreased to 4.75 per cent. The fair value for the bond is CU153,811, consistent with an interest rate of 7.6 percent.[6]

IE4. The entity assumes a flat yield curve, all changes in interest rates result from a parallel shift in the yield curve, and the changes in LIBOR are the only relevant changes in market conditions.

IE5. The entity estimates the amount of change in the fair value of the bond that is not attributable to changes in market conditions that give rise to market risk as follows:

[paragraph AG241(a)] First, the entity computes the liability's internal rate of return at the start of the period using the observed market price of the liability and the liability's contractual cash flows at the start of the period. It deducts from this rate of return the observed (benchmark) interest rate at the start of the period, to arrive at an instrument-specific component of the internal rate of return.	At the start of the period of a 10-year bond with a coupon of 8 per cent, the bond's internal rate of return is 8 per cent. Because the observed (benchmark) interest rate (LIBOR) is 5 per cent, the instrument-specific component of the internal rate of return is 3 per cent.
[paragraph AG241(b)] Next, the entity calculates the present value of the cash flows associated with the liability using the liability's contractual cash flows at the end of the period and a discount rate equal to the sum of (i) the observed (benchmark) interest rate at the end of the period and (ii) the instrument-specific component of the internal rate of return as determined in accordance with paragraph AG241(a).	The contractual cash flows of the instrument at the end of the period are: Interest: CU12,000[(a)] per year for each of years 2–10. Principal: CU150,000 in year 10. The discount rate to be used to calculate the present value of the bond is thus 7.75 per cent, which is the end of period LIBOR rate of 4.75 per cent, plus the 3 per cent instrument-specific component. This gives a present value of CU152,367.[(b)]

5 In this guidance monetary amounts are denominated in 'currency units' (CU).

6 This reflects a shift in LIBOR from 5 per cent to 4.75 per cent and a movement of 0.15 per cent which, in the absence of other relevant changes in market conditions, is assumed to reflect changes in credit risk of the instrument.

[paragraph AG241(c)] The difference between the observed market price of the liability at the end of the period and the amount determined in accordance with paragraph AG241(b) is the change in fair value that is not attributable to changes in the observed (benchmark) interest rate. This is the amount to be presented in net assets/equity in accordance with paragraph 108(a).	The market price of the liability at the end of the period is CU153,811.(c) Thus, the entity presents CU1,444 in net assets/equity, which is CU153,811 – CU152,367, as the increase in fair value of the bond that is not attributable to changes in market conditions that give rise to market risk.

(a) CU150,000 × 8 percent = CU12,000.

(b) PV = [CU12,000 × (1 – (1 + 0.0775)-9)/0.0775] + CU150,000 × (1 + 0.0775)-9.

(c) market price = [CU12,000 × (1 – (1 + 0.076)-9)/0.076] + CU150,000 × (1 + 0.076)-9.

Impairment (Paragraphs 73–93)

Assessing Significant Increases in Credit Risk Since Initial Recognition

IE6. The following examples illustrate possible ways to assess whether there have been significant increases in credit risk since initial recognition. For simplicity of illustration, the following examples only show one aspect of the credit risk analysis. However, the assessment of whether lifetime expected credit losses should be recognized is a multifactor and holistic analysis that considers reasonable and supportable information that is available without undue cost or effort and that is relevant for the particular financial instrument being assessed.

Example 1—Significant Increase in Credit Risk

IE7. Company Y has a funding structure that includes a senior secured loan facility with different tranches[7]. Company Y qualifies for assistance from the National Development Bank which provides a tranche of the loan facility to Company Y. At the time of origination of the loan by the National Development Bank, although Company Y's leverage was relatively high compared with other issuers with similar credit risk, it was expected that Company Y would be able to meet the covenants for the life of the instrument. In addition, the generation of revenue and cash flow was expected to be stable in Company Y's industry over the term of the senior facility. However, there was some business risk related to the ability to grow gross margins within its existing businesses.

IE8. At initial recognition, because of the considerations outlined in paragraph IE7, the National Development Bank considers that despite the level of credit risk at initial recognition, the loan is not an originated credit-impaired loan because it does not meet the definition of a credit-impaired financial asset in paragraph 9 of IPSAS 41.

IE9. Subsequent to initial recognition, macroeconomic changes have had a negative effect on total sales volume and Company Y has underperformed on its business plan for revenue generation and net cash flow generation. Although spending on inventory has increased, anticipated sales have not materialized. To increase liquidity, Company Y has drawn down more on a separate revolving credit facility, thereby increasing its leverage ratio. Consequently, Company Y is now close to breaching its covenants on the senior secured loan facility with the National Development Bank.

[7] The security on the loan affects the loss that would be realized if a default occurs, but does not affect the risk of a default occurring, so it is not considered when determining whether there has been a significant increase in credit risk since initial recognition as required by paragraph 75 of IPSAS 41.

IE10. The National Development Bank makes an overall assessment of the credit risk on the loan to Company Y at the reporting date by taking into consideration all reasonable and supportable information that is available without undue cost or effort and that is relevant for assessing the extent of the increase in credit risk since initial recognition. This may include factors such as:

(a) The National Development Bank's expectation that the deterioration in the macroeconomic environment may continue in the near future, which is expected to have a further negative impact on Company Y's ability to generate cash flows and to deleverage.

(b) Company Y is closer to breaching its covenants, which may result in a need to restructure the loan or reset the covenants.

(c) The National Development Bank's assessment that the trading prices for Company Y's bonds have decreased and that the credit margin on newly originated loans have increased reflecting the increase in credit risk, and that these changes are not explained by changes in the market environment (for example, benchmark interest rates have remained unchanged). A further comparison with the pricing of Company Y's peers shows that reductions in the price of Company Y's bonds and increases in credit margin on its loans have probably been caused by company-specific factors.

(d) The National Development Bank has reassessed its internal risk grading of the loan on the basis of the information that it has available to reflect the increase in credit risk.

IE11. The National Development Bank determines that there has been a significant increase in credit risk since initial recognition of the loan in accordance with paragraph 75 of IPSAS 41. Consequently, the National Development Bank recognizes lifetime expected credit losses on its senior secured loan to Company Y. Even if the National Development Bank has not yet changed the internal risk grading of the loan it could still reach this conclusion—the absence or presence of a change in risk grading in itself is not determinative of whether credit risk has increased significantly since initial recognition.

Example 2—No Significant Increase in Credit Risk

IE12. Company C, is the holding company of a group that operates in a cyclical production industry. State Government B provided a loan to Company C. At that time, the prospects for the industry were positive, because of expectations of further increases in global demand. However, input prices were volatile and given the point in the cycle, a potential decrease in sales was anticipated.

IE13. In addition, in the past Company C has been focused on external growth, acquiring majority stakes in companies in related sectors. As a result, the group structure is complex and has been subject to change, making it difficult for investors to analyze the expected performance of the group and to forecast the cash that will be available at the holding company level. Even though leverage is at a level that is considered acceptable by Company C's creditors at the time that State Government B originates the loan, its creditors are concerned about Company C's ability to refinance its debt because of the short remaining life until the maturity of the current financing. There is also concern about Company C's ability to continue to service interest using the dividends it receives from its operating subsidiaries.

IE14. At the time of the origination of the loan by State Government B, Company C's leverage was in line with that of other borrowers with similar credit risk and based on projections over the expected life of the loan, the available capacity (i.e., headroom) on its coverage ratios before triggering a default event, was high. State Government B applies its own internal rating methods to determine credit risk and allocates a specific internal rating score to its loans. State Government B's internal rating categories are based on historical, current and forward-looking information and reflect the credit risk for the tenor of the loans. On initial recognition, State Government B determines that the loan is subject to considerable credit risk, has speculative elements and that the uncertainties affecting Company C, including the group's uncertain prospects for cash generation,

could lead to default. However, State Government B does not consider the loan to be originated credit-impaired because it does not meet the definition of a purchased or originated credit-impaired financial asset in paragraph 9 of IPSAS 41.

IE15. Subsequent to initial recognition, Company C has announced that three of its five key subsidiaries had a significant reduction in sales volume because of deteriorated market conditions but sales volumes are expected to improve in line with the anticipated cycle for the industry in the following months. The sales of the other two subsidiaries were stable. Company C has also announced a corporate restructure to streamline its operating subsidiaries. This restructuring will increase the flexibility to refinance existing debt and the ability of the operating subsidiaries to pay dividends to Company C.

IE16. Despite the expected continuing deterioration in market conditions, State Government B determines, in accordance with paragraph 75 of IPSAS 41, that there has not been a significant increase in the credit risk on the loan to Company C since initial recognition. This is demonstrated by factors that include:

(a) Although current sale volumes have fallen, this was as anticipated by State Government B at initial recognition. Furthermore, sales volumes are expected to improve, in the following months.

(b) Given the increased flexibility to refinance the existing debt at the operating subsidiary level and the increased availability of dividends to Company C, State Government B views the corporate restructure as being credit enhancing. This is despite some continued concern about the ability to refinance the existing debt at the holding company level.

(c) State Government B's credit risk department, which monitors Company C, has determined that the latest developments are not significant enough to justify a change in its internal credit risk rating.

IE17. As a consequence, State Government B does not recognize a loss allowance at an amount equal to lifetime expected credit losses on the loan. However, it updates its measurement of the 12-month expected credit losses for the increased risk of a default occurring in the next 12 months and for current expectations of the credit losses that would arise if a default were to occur.

Example 3—Highly Collateralized Financial Asset

IE18. Company H owns land which is financed by a five-year loan from the State owned Agricultural Bank with a loan-to-value (LTV) ratio of 50 per cent. The loan is secured by a first-ranking security over the land. At initial recognition of the loan, the State owned Agricultural Bank does not consider the loan to be originated credit-impaired as defined in paragraph 9 of IPSAS 41.

IE19. Subsequent to initial recognition, the revenues and operating profits of Company H have decreased because of an economic recession. Furthermore, expected increases in regulations have the potential to further negatively affect revenue and operating profit. These negative effects on Company H's operations could be significant and ongoing.

IE20. As a result of these recent events and expected adverse economic conditions, Company H's free cash flow is expected to be reduced to the point that the coverage of scheduled loan payments could become tight. The State owned Agricultural Bank estimates that a further deterioration in cash flows may result in Company H missing a contractual payment on the loan and becoming past due.

IE21. Recent third party appraisals have indicated a decrease in the value of the land, resulting in a current LTV ratio of 70 per cent.

IE22. At the reporting date, the loan to Company H is not considered to have low credit risk in accordance with paragraph 82 of IPSAS 41. The State owned Agricultural Bank therefore needs to assess whether there has been a significant increase in credit risk since initial recognition in accordance with paragraph 75 of IPSAS 41, irrespective of the value of the collateral it holds. It notes that the loan is subject to considerable

credit risk at the reporting date because even a slight deterioration in cash flows could result in Company H missing a contractual payment on the loan. As a result, the State owned Agricultural Bank determines that the credit risk (i.e., the risk of a default occurring) has increased significantly since initial recognition. Consequently, the State owned Agricultural Bank recognizes lifetime expected credit losses on the loan to Company H.

IE23. Although lifetime expected credit losses should be recognized, the measurement of the expected credit losses will reflect the recovery expected from the collateral (adjusting for the costs of obtaining and selling the collateral) on the property as required by paragraph AG219 of IPSAS 41 and may result in the expected credit losses on the loan being very small.

Example 4—Public Investment-Grade Bond

IE24. Company A is a large listed national logistics company. The only debt in the capital structure is a five-year public bond with a restriction on further borrowing as the only bond covenant. Company A reports quarterly to its shareholders. The National Public Investment Fund is one of many investors in the bond. The Investment Fund considers the bond to have low credit risk at initial recognition in accordance with paragraph 82 of IPSAS 41. This is because the bond has a low risk of default and Company A is considered to have a strong capacity to meet its obligations in the near term. The Investment Fund's expectations for the longer term are that adverse changes in economic and business conditions may, but will not necessarily, reduce Company A's ability to fulfil its obligations on the bond. In addition, at initial recognition the bond had an internal credit rating that is correlated to a global external credit rating of investment grade.

IE25. At the reporting date, the Investment Fund's main credit risk concern is the continuing pressure on the total volume of sales that has caused Company A's operating cash flows to decrease.

IE26. Because the Investment Fund relies only on quarterly public information and does not have access to private credit risk information (because it is a bond investor), its assessment of changes in credit risk is tied to public announcements and information, including updates on credit perspectives in press releases from rating agencies.

IE27. The Investment Fund applies the low credit risk simplification in paragraph 82 of IPSAS 41. Accordingly, at the reporting date, the Investment Fund evaluates whether the bond is considered to have low credit risk using all reasonable and supportable information that is available without undue cost or effort. In making that evaluation, the Investment Fund reassesses the internal credit rating of the bond and concludes that the bond is no longer equivalent to an investment grade rating because:

(a) The latest quarterly report of Company A revealed a quarter-on-quarter decline in revenues of 20 per cent and in operating profit by 12 per cent.

(b) Rating agencies have reacted negatively to a profit warning by Company A and put the credit rating under review for possible downgrade from investment grade to non-investment grade. However, at the reporting date the external credit risk rating was unchanged.

(c) The bond price has also declined significantly, which has resulted in a higher yield to maturity. The Investment Fund assesses that the bond prices have been declining as a result of increases in Company A's credit risk. This is because the market environment has not changed (for example, benchmark interest rates, liquidity etc. are unchanged) and comparison with the bond prices of peers shows that the reductions are probably company specific (instead of being, for example, changes in benchmark interest rates that are not indicative of company-specific credit risk).

IE28. While Company A currently has the capacity to meet its commitments, the large uncertainties arising from its exposure to adverse business and economic conditions have increased the risk of a default occurring on the bond. As a result of the factors described in paragraph IE27, the Investment Fund determines that the bond

does not have low credit risk at the reporting date. As a result, the Investment Fund needs to determine whether the increase in credit risk since initial recognition has been significant. On the basis of its assessment, the Investment Fund determines that the credit risk has increased significantly since initial recognition and that a loss allowance at an amount equal to lifetime expected credit losses should be recognized in accordance with paragraph 75 of IPSAS 41.

Example 5—Responsiveness to Changes in Credit Risk

IE29. Housing Corporation ABC provides mortgages to citizens of ABC to finance residential real estate in three different regions. The mortgage loans are originated across a wide range of LTV criteria and a wide range of income groups. As part of the mortgage application process, borrowers are required to provide information such as the industry within which the borrower is employed and the post code of the property that serves as collateral on the mortgage.

IE30. Housing Corporation ABC sets its acceptance criteria based on credit scores. Loans with a credit score above the 'acceptance level' are approved because these borrowers are considered to be able to meet contractual payment obligations. When new mortgage loans are originated, Housing Corporation ABC uses the credit score to determine the risk of a default occurring as at initial recognition.

IE31. At the reporting date Housing Corporation ABC determines that economic conditions are expected to deteriorate significantly in all regions. Unemployment levels are expected to increase while the value of residential property is expected to decrease, causing the LTV ratios to increase. As a result of the expected deterioration in economic conditions, Housing Corporation ABC expects default rates on the mortgage portfolio to increase.

Individual Assessment

IE32. In Region One, Housing Corporation ABC assesses each of its mortgage loans on a monthly basis by means of an automated behavioral scoring process. Its scoring models are based on current and historical past due statuses, levels of borrower indebtedness, LTV measures, the loan size and the time since the origination of the loan. Housing Corporation ABC updates the LTV measures on a regular basis through an automated process that re-estimates property values using recent sales in each post code area and reasonable and supportable forward-looking information that is available without undue cost or effort.

IE33. Housing Corporation ABC has historical data that indicates a strong correlation between the value of residential property and the default rates for mortgages. That is, when the value of residential property declines, a borrower has less economic incentive to make scheduled mortgage repayments, increasing the risk of a default occurring.

IE34. Through the impact of the LTV measure in the behavioral scoring model, an increased risk of a default occurring due to an expected decline in residential property value adjusts the behavioral scores. The behavioral score can be adjusted as a result of expected declines in property value even when the mortgage loan is a bullet loan with the most significant payment obligations at maturity (and beyond the next 12 months). Mortgages with a high LTV ratio are more sensitive to changes in the value of the residential property and Housing Corporation ABC is able to identify significant increases in credit risk since initial recognition on individual borrowers before a mortgage becomes past due if there has been a deterioration in the behavioral score.

IE35. When the increase in credit risk has been significant, a loss allowance at an amount equal to lifetime expected credit losses is recognized. Housing Corporation ABC measures the loss allowance by using the LTV measures to estimate the severity of the loss, i.e., the loss given default (LGD). The higher the LTV measure, the higher the expected credit losses all else being equal.

IE36. If Housing Corporation ABC was unable to update behavioral scores to reflect the expected declines in property prices, it would use reasonable and supportable information that is available without undue cost or effort to undertake a collective assessment to determine the loans on which there has been a significant increase in credit risk since initial recognition and recognize lifetime expected credit losses for those loans.

Collective Assessment

IE37. In Regions Two and Three, Housing Corporation ABC does not have an automated scoring capability. Instead, for credit risk management purposes, Housing Corporation ABC tracks the risk of a default occurring by means of past due statuses. It recognizes a loss allowance at an amount equal to lifetime expected credit losses for all loans that have a past due status of more than 30 days past due. Although Housing Corporation ABC uses past due status information as the only borrower-specific information, it also considers other reasonable and supportable forward-looking information that is available without undue cost or effort to assess whether lifetime expected credit losses should be recognized on loans that are not more than 30 days past due. This is necessary in order to meet the objective in paragraph 76 of IPSAS 41 of recognizing lifetime expected credit losses for all significant increases in credit risk.

Region Two

IE38. Region Two includes a mining community that is largely dependent on the export of coal and related products. Housing Corporation ABC becomes aware of a significant decline in coal exports and anticipates the closure of several coal mines. Because of the expected increase in the unemployment rate, the risk of a default occurring on mortgage loans to borrowers who are employed by the coal mines is determined to have increased significantly, even if those borrowers are not past due at the reporting date. Housing Corporation ABC therefore segments its mortgage portfolio by the industry within which borrowers are employed (using the information recorded as part of the mortgage application process) to identify borrowers that rely on coal mining as the dominant source of employment (i.e., a 'bottom up' approach in which loans are identified based on a common risk characteristic). For those mortgages, Housing Corporation ABC recognizes a loss allowance at an amount equal to lifetime expected credit losses while it continues to recognize a loss allowance at an amount equal to 12-month expected credit losses for all other mortgages in Region Two.[8] Newly originated mortgages to borrowers who are economically dependent on the coal mines in this community would, however, have a loss allowance at an amount equal to 12-month expected credit losses because they would not have experienced significant increases in credit risk since initial recognition. However, some of these mortgages may experience significant increases in credit risk soon after initial recognition because of the expected closure of the coal mines.

Region Three

IE39. In Region Three, Housing Corporation ABC anticipates the risk of a default occurring and thus an increase in credit risk, as a result of an expected increase in interest rates during the expected life of the mortgages. Historically, an increase in interest rates has been a lead indicator of future defaults on mortgages in Region Three—especially when borrowers do not have a fixed interest rate mortgage. Housing Corporation ABC determines that the variable interest-rate portfolio of mortgages in Region Three is homogenous and that unlike for Region Two, it is not possible to identify particular sub-portfolios on the basis of shared risk characteristics that represent borrowers who are expected to have increased significantly in credit risk. However, as a result of the homogenous nature of the mortgages in Region Three, Housing Corporation ABC determines that an assessment can be made of a proportion of the overall portfolio that has significantly increased in credit risk since initial recognition (i.e., a 'top down' approach can be used). Based on historical

[8] Except for those mortgages that are determined to have significantly increased in credit risk based on an individual assessment, such as those that are more than 30 days past due. Lifetime expected credit losses would also be recognized on those mortgages.

information, Housing Corporation ABC estimates that an increase in interest rates of 200 basis points will cause a significant increase in credit risk on 20 per cent of the variable interest-rate portfolio. Therefore, as a result of the anticipated increase in interest rates, Housing Corporation ABC determines that the credit risk on 20 per cent of mortgages in Region Three has increased significantly since initial recognition. Accordingly Housing Corporation ABC recognizes lifetime expected credit losses on 20 per cent of the variable rate mortgage portfolio and a loss allowance at an amount equal to 12-month expected credit losses for the remainder of the portfolio.[9]

Example 6—Comparison to Maximum Initial Credit Risk

IE40. The Economic Development Agency has two portfolios of small business loans with similar terms and conditions in Region W. The Economic Development Agency's policy on financing decisions for each loan is based on an internal credit rating system that considers a borrower's credit history, payment behavior and other factors, and assigns an internal credit risk rating from 1 (lowest credit risk) to 10 (highest credit risk) to each loan on origination. The risk of a default occurring increases exponentially as the credit risk rating deteriorates so, for example, the difference between credit risk rating grades 1 and 2 is smaller than the difference between credit risk rating grades 2 and 3. Loans in Portfolio 1 were only offered to repeat borrowers with a similar internal credit risk rating and at initial recognition all loans were rated 3 or 4 on the internal rating scale. The Economic Development Agency determines that the maximum initial credit risk rating at initial recognition it would accept for Portfolio 1 is an internal rating of 4. Loans in Portfolio 2 were offered to borrowers that responded to an advertisement for small business loans and the internal credit risk ratings of these borrowers range between 4 and 7 on the internal rating scale. The Economic Development Agency never originates a small business loan with an internal credit risk rating worse than 7 (i.e., with an internal rating of 8–10).

IE41. For the purposes of assessing whether there have been significant increases in credit risk, the Economic Development Agency determines that all loans in Portfolio 1 had a similar initial credit risk. It determines that given the risk of default reflected in its internal risk rating grades, a change in internal rating from 3 to 4 would not represent a significant increase in credit risk but that there has been a significant increase in credit risk on any loan in this portfolio that has an internal rating worse than 5. This means that the Department of Finance does not have to know the initial credit rating of each loan in the portfolio to assess the change in credit risk since initial recognition. It only has to determine whether the credit risk is worse than 5 at the reporting date to determine whether lifetime expected credit losses should be recognized in accordance with paragraph 75 of IPSAS 41.

IE42. However, determining the maximum initial credit risk accepted at initial recognition for Portfolio 2 at an internal credit risk rating of 7, would not meet the objective of the requirements as stated in paragraph 76 of IPSAS 41. This is because the Economic Development Agency determines that significant increases in credit risk arise not only when credit risk increases above the level at which an entity would originate new financial assets (i.e., when the internal rating is worse than 7). Although the Economic Development Agency never originates a small business loan with an internal credit rating worse than 7, the initial credit risk on loans in Portfolio 2 is not of sufficiently similar credit risk at initial recognition to apply the approach used for Portfolio 1. This means that the Economic Development Agency cannot simply compare the credit risk at the reporting date with the lowest credit quality at initial recognition (for example, by comparing the internal credit risk rating of loans in Portfolio 2 with an internal credit risk rating of 7) to determine whether credit risk has increased significantly because the initial credit quality of loans in the portfolio is too diverse. For example, if a loan

[9] Except for those mortgages that are determined to have significantly increased in credit risk based on an individual assessment, such as those that are more than 30 days past due. Lifetime expected credit losses would also be recognized on those mortgages.

initially had a credit risk rating of 4 the credit risk on the loan may have increased significantly if its internal credit risk rating changes to 6.

Example 7—Counterparty Assessment of Credit Risk

Scenario 1

IE43. In 20X0 the Infrastructure Bank of Country A granted a loan of CU10,000 with a contractual term of 15 years to Company Q when the company had an internal credit risk rating of 4 on a scale of 1 (lowest credit risk) to 10 (highest credit risk). The risk of a default occurring increases exponentially as the credit risk rating deteriorates so, for example, the difference between credit risk rating grades 1 and 2 is smaller than the difference between credit risk rating grades 2 and 3. In 20X5, when Company Q had an internal credit risk rating of 6, the Infrastructure Bank issued another loan to Company Q for CU5,000 with a contractual term of 10 years. In 20X7 Company Q fails to retain its contract with a major customer and correspondingly experiences a large decline in its revenue. The Infrastructure Bank considers that as a result of losing the contract, Company Q will have a significantly reduced ability to meet its loan obligations and changes its internal credit risk rating to 8.

IE44. The Infrastructure Bank assesses credit risk on a counterparty level for credit risk management purposes and determines that the increase in Company Q's credit risk is significant. Although the Infrastructure Bank did not perform an individual assessment of changes in the credit risk on each loan since its initial recognition, assessing the credit risk on a counterparty level and recognizing lifetime expected credit losses on all loans granted to Company Q, meets the objective of the impairment requirements as stated in paragraph 76 of IPSAS 41. This is because, even since the most recent loan was originated (in 20X7) when Company Q had the highest credit risk at loan origination, its credit risk has increased significantly. The counterparty assessment would therefore achieve the same result as assessing the change in credit risk for each loan individually.

Scenario 2

IE45. The Infrastructure Bank of Country A granted a loan of CU150,000 with a contractual term of 20 years to Company X in 20X0 when the company had an internal credit risk rating of 4. During 20X5 economic conditions deteriorate and demand for Company X's products has declined significantly. As a result of the reduced cash flows from lower sales, Company X could not make full payment of its loan installment to the Infrastructure Bank. The Infrastructure Bank re-assesses Company X's internal credit risk rating, and determines it to be 7 at the reporting date. The Infrastructure Bank considered the change in credit risk on the loan, including considering the change in the internal credit risk rating, and determines that there has been a significant increase in credit risk and recognizes lifetime expected credit losses on the loan of CU150,000.

IE46. Despite the recent downgrade of the internal credit risk rating, the Infrastructure Bank grants another loan of CU50,000 to Company X in 20X6 with a contractual term of 5 years, taking into consideration the higher credit risk at that date.

IE47. The fact that Company X's credit risk (assessed on a counterparty basis) has previously been assessed to have increased significantly, does not result in lifetime expected credit losses being recognized on the new loan. This is because the credit risk on the new loan has not increased significantly since the loan was initially recognized. If the Infrastructure Bank only assessed credit risk on a counterparty level, without considering whether the conclusion about changes in credit risk applies to all individual financial instruments provided to the same borrower, the objective in paragraph 76 of IPSAS 41 would not be met.

Recognition and Measurement of Expected Credit Losses

IE48. The following examples illustrate the application of the recognition and measurement requirements in accordance with paragraphs 73–93 of IPSAS 41, as well as the interaction with the hedge accounting requirements.

Example 8—12-Month Expected Credit Loss Measurement Using an Explicit 'Probability of Default' Approach

Scenario 1

IE49. Government A originates a single 10 year amortizing loan for CU1 million. Taking into consideration the expectations for instruments with similar credit risk (using reasonable and supportable information that is available without undue cost or effort), the credit risk of the borrower, and the economic outlook for the next 12 months, Government A estimates that the loan at initial recognition has a probability of default (PD) of 0.5 per cent over the next 12 months. Government A also determines that changes in the 12-month PD are a reasonable approximation of the changes in the lifetime PD for determining whether there has been a significant increase in credit risk since initial recognition.

IE50. At the reporting date (which is before payment on the loan is due[10]), there has been no change in the 12-month PD and Government A determines that there was no significant increase in credit risk since initial recognition. Government A determines that 25 per cent of the gross carrying amount will be lost if the loan defaults (i.e., the LGD is 25 per cent).[11] Government A measures the loss allowance at an amount equal to 12-month expected credit losses using the 12-month PD of 0.5 per cent. Implicit in that calculation is the 99.5 per cent probability that there is no default. At the reporting date the loss allowance for the 12 month expected credit losses is CU1,250 (0.5 percent × 25 percent × CU1,000,000).

Scenario 2

IE51. Government B acquires a portfolio of 1,000 five year bullet loans for CU1,000 each (i.e., CU1million in total) with an average 12-month PD of 0.5 per cent for the portfolio. Government B determines that because the loans only have significant payment obligations beyond the next 12 months, it would not be appropriate to consider changes in the 12-month PD when determining whether there have been significant increases in credit risk since initial recognition. At the reporting date Government B therefore uses changes in the lifetime PD to determine whether the credit risk of the portfolio has increased significantly since initial recognition.

IE52. Government B determines that there has not been a significant increase in credit risk since initial recognition and estimates that the portfolio has an average LGD of 25 per cent. Government B determines that it is appropriate to measure the loss allowance on a collective basis in accordance with IPSAS 41. The 12-month PD remains at 0.5 per cent at the reporting date. Government B therefore measures the loss allowance on a collective basis at an amount equal to 12-month expected credit losses based on the average 0.5 per cent 12-month PD. Implicit in the calculation is the 99.5 per cent probability that there is no default. At the reporting date the loss allowance for the 12-month expected credit losses is CU1,250 (0.5 percent × 25 percent × CU1,000,000).

Example 9—12-Month Expected Credit Loss Measurement Based on a Loss Rate Approach

IE53. Government A originates 2,000 bullet loans with a total gross carrying amount of CU500,000. Government A segments its portfolio into borrower groups (Groups X and Y) on the basis of shared credit risk characteristics at initial recognition. Group X comprises 1,000 loans with a gross carrying amount per

[10] Thus for simplicity of illustration it is assumed there is no amortization of the loan.

[11] Because the LGD represents a percentage of the present value of the gross carrying amount, this example does not illustrate the time value of money.

borrower of CU200, for a total gross carrying amount of CU200,000. Group Y comprises 1,000 loans with a gross carrying amount per borrower of CU300, for a total gross carrying amount of CU300,000. There are no transaction costs and the loan contracts include no options (for example, prepayment or call options), premiums or discounts, points paid, or other fees.

IE54. Government A measures expected credit losses on the basis of a loss rate approach for Groups X and Y. In order to develop its loss rates, Government A considers samples of its own historical default and loss experience for those types of loans. In addition, Government A considers forward-looking information, and updates its historical information for current economic conditions as well as reasonable and supportable forecasts of future economic conditions. Historically, for a population of 1,000 loans in each group, Group X's loss rates are 0.3 percent, based on four defaults, and historical loss rates for Group Y are 0.15 percent, based on two defaults.

	Number of clients in sample	**Estimated per client gross carrying amount at default**	**Total estimated gross carrying amount at default**	**Historic per annum average defaults**	**Estimated total gross carrying amount at default**	**Present value of observed loss[(a)]**	**Loss rate**
Group	A	B	C = A × B	D	E = B × D	F	G = F ÷ C
X	1,000	CU200	CU200,000	4	CU800	CU600	0.3 percent
Y	1,000	CU300	CU300,000	2	CU600	CU450	0.15 percent

(a) In accordance with paragraph 90(b) expected credit losses should be discounted using the effective interest rate. However, for purposes of this example, the present value of the observed loss is assumed.

IE55. At the reporting date, Government A expects an increase in defaults over the next 12 months compared to the historical rate. As a result, Government A estimates five defaults in the next 12 months for loans in Group X and three for loans in Group Y. It estimates that the present value of the observed credit loss per client will remain consistent with the historical loss per client.

IE56. On the basis of the expected life of the loans, Government A determines that the expected increase in defaults does not represent a significant increase in credit risk since initial recognition for the portfolios. On the basis of its forecasts, Government A measures the loss allowance at an amount equal to 12-month expected credit losses on the 1,000 loans in each group amounting to CU750 and CU675 respectively. This equates to a loss rate in the first year of 0.375 per cent for Group X and 0.225 per cent for Group Y.

	Number of clients in sample	**Estimated per client gross carrying amount at default**	**Total estimated gross carrying amount at default**	**Expected defaults**	**Estimated total gross carrying amount at default**	**Present value of observed loss**	**Loss rate**
Group	A	B	C = A × B	D	E = B × D	F	G = F ÷ C
X	1,000	CU200	CU200,000	5	CU1,000	CU750	0.375 percent
Y	1,000	CU300	CU300,000	3	CU900	CU675	0.225 percent

IE57. Government A uses the loss rates of 0.375 percent and 0.225 percent respectively to estimate 12-month expected credit losses on new loans in Group X and Group Y originated during the year and for which credit risk has not increased significantly since initial recognition.

Example 10—Revolving Credit Facilities

IE58. The Development Agency of Country A issues revolving loans to small construction companies that deliver public infrastructure. These revolving loans provide small construction companies with liquidity when cash inflows are limited. The revolving loans have a one-day notice period after which the Development Agency has the contractual right to cancel the loan (both the drawn and undrawn components). However, the Development Agency does not enforce its contractual right to cancel the revolving loans in the normal day-to-day management of the instruments and only cancels facilities when it becomes aware of an increase in credit risk and starts to monitor borrowers on an individual basis. The Development Agency therefore does not consider the contractual right to cancel the revolving loans to limit its exposure to credit losses to the contractual notice period.

IE59. For credit risk management purposes the Development Agency considers that there is only one set of contractual cash flows from borrowers to assess and does not distinguish between the drawn and undrawn balances at the reporting date. The portfolio is therefore managed and expected credit losses are measured on a facility level.

IE60. At the reporting date the outstanding balance on the revolving loan portfolio is CU60,000 and the available undrawn facility is CU40,000. The Development Agency determines the expected life of the portfolio by estimating the period over which it expects to be exposed to credit risk on the facilities at the reporting date, taking into account:

(a) The period over which it was exposed to credit risk on a similar portfolio of revolving construction loans;

(b) The length of time for related defaults to occur on similar financial instruments; and

(c) Past events that led to credit risk management actions because of an increase in credit risk on similar financial instruments, such as the reduction or removal of undrawn credit limits.

IE61. On the basis of the information listed in paragraph IE60, Development Agency determines that the expected life of the revolving loan portfolio is 30 months.

IE62. At the reporting date the Development Agency assesses the change in the credit risk on the portfolio since initial recognition and determines in accordance with paragraph 75 of IPSAS 41 that the credit risk on a portion of the loan facilities representing 25 per cent of the portfolio, has increased significantly since initial recognition. The outstanding balance on these credit facilities for which lifetime expected credit losses should be recognized is CU20,000 and the available undrawn facility is CU10,000.

IE63. When measuring the expected credit losses in accordance with paragraph 93 of IPSAS 41, Development Agency considers its expectations about future draw-downs over the expected life of the portfolio (i.e., 30 months) in accordance with paragraph AG195 and estimates what it expects the outstanding balance (i.e., exposure at default) on the portfolio would be if borrowers were to default. By using its credit risk models Development Agency determines that the exposure at default on the revolving loan facilities for which lifetime expected credit losses should be recognized, is CU25,000 (i.e., the drawn balance of CU20,000 plus further draw-downs of CU5,000 from the available undrawn commitment). The exposure at default of the loan facilities for which 12-month expected credit losses are recognized, is CU45,000 (i.e., the outstanding balance of CU40,000 and an additional draw-down of CU5,000 from the undrawn commitment over the next 12 months).

IE64. The exposure at default and expected life determined by the Development Agency are used to measure the lifetime expected credit losses and 12-month expected credit losses on its loan portfolio.

IE65. The Development Agency measures expected credit losses on a facility level and therefore cannot separately identify the expected credit losses on the undrawn commitment component from those on the loan component. It recognizes expected credit losses for the undrawn commitment together with the loss

allowance for the loan component in the statement of financial position. To the extent that the combined expected credit losses exceed the gross carrying amount of the financial asset, the expected credit losses should be presented as a provision (in accordance with IPSAS 30, *Financial Instruments: Disclosures*).

Example 11—Modification of Contractual Cash Flows

IE66. Government A originates a five-year loan that requires the repayment of the outstanding contractual amount in full at maturity. Its contractual par amount is CU1,000 with an interest rate of 5 per cent payable annually. The effective interest rate is 5 per cent. At the end of the first reporting period (Period 1), Government A recognizes a loss allowance at an amount equal to 12-month expected credit losses because there has not been a significant increase in credit risk since initial recognition. A loss allowance balance of CU20 is recognized.

IE67. In the subsequent reporting period (Period 2), Government A determines that the credit risk on the loan has increased significantly since initial recognition. As a result of this increase, Government A recognizes lifetime expected credit losses on the loan. The loss allowance balance is CU30.

IE68. At the end of the third reporting period (Period 3), following significant financial difficulty of the borrower, Government A modifies the contractual cash flows on the loan. It extends the contractual term of the loan by one year so that the remaining term at the date of the modification is three years. The modification does not result in the derecognition of the loan by Government A.

IE69. As a result of that modification, Government A recalculates the gross carrying amount of the financial asset as the present value of the modified contractual cash flows discounted at the loan's original effective interest rate of 5 per cent. In accordance with paragraph 71 of IPSAS 41, the difference between this recalculated gross carrying amount and the gross carrying amount before the modification is recognized as a modification gain or loss. Government A recognizes the modification loss (calculated as CU300) against the gross carrying amount of the loan, reducing it to CU700, and a modification loss of CU300 in surplus or deficit.

IE70. Government A also remeasures the loss allowance, taking into account the modified contractual cash flows and evaluates whether the loss allowance for the loan shall continue to be measured at an amount equal to lifetime expected credit losses. Government A compares the current credit risk (taking into consideration the modified cash flows) to the credit risk (on the original unmodified cash flows) at initial recognition. Government A determines that the loan is not credit-impaired at the reporting date but that credit risk has still significantly increased compared to the credit risk at initial recognition and continues to measure the loss allowance at an amount equal to lifetime expected credit losses. The loss allowance balance for lifetime expected credit losses is CU100 at the reporting date.

Period	**Beginning gross carrying amount**	**Impairment (loss)/gain**	**Modification (loss)/gain**	**Interest revenue**	**Cash flows**	**Ending gross carrying amount**	**Loss allowance**	**Ending amortised cost amount**
	A	B	C	D Gross: A × 5 percent	E	F = A + C + D – E	G	H = F – G
1	CU1,000	(CU20)		CU50	CU50	CU1,000	CU20	CU980
2	CU1,000	(CU10)		CU50	CU50	CU1,000	CU30	CU970
3	CU1,000	(CU70)	(CU300)	CU50	CU50	CU700	CU100	CU600

IE71. At each subsequent reporting date, Government A evaluates whether there is a significant increase in credit risk by comparing the loan's credit risk at initial recognition (based on the original, unmodified cash flows) with the credit risk at the reporting date (based on the modified cash flows), in accordance with paragraph 84 of IPSAS 41.

IE72. Two reporting periods after the loan modification (Period 5), the borrower has outperformed its business plan significantly compared to the expectations at the modification date. In addition, the outlook for the business is more positive than previously envisaged. An assessment of all reasonable and supportable information that is available without undue cost or effort indicates that the overall credit risk on the loan has decreased and that the risk of a default occurring over the expected life of the loan has decreased, so Government A adjusts the borrower's internal credit rating at the end of the reporting period.

IE73. Given the positive overall development, Government A re-assesses the situation and concludes that the credit risk of the loan has decreased and there is no longer a significant increase in credit risk since initial recognition. As a result, Government A once again measures the loss allowance at an amount equal to 12-month expected credit losses.

Example 12—Provision Matrix

IE74. Municipality M provides water delivery services for households within its jurisdiction. Households are invoiced on a monthly basis based on the water consumed during the period. This represents a portfolio of trade receivables of CU30 million in 20X1 for Municipality M. The portfolio consists of a large number of households with small balances outstanding. The trade receivables are categorized by common risk characteristics that are representative of the households' abilities to pay all amounts due in accordance with the contractual terms. The trade receivables do not have a significant financing component. In accordance with paragraph 87 of IPSAS 41 the loss allowance for such trade receivables is always measured at an amount equal to lifetime time expected credit losses.

IE75. To determine the expected credit losses for the portfolio, Municipality M uses a provision matrix. The provision matrix is based on its historical observed default rates over the expected life of the trade receivables and is adjusted for forward-looking estimates. At every reporting date the historical observed default rates are updated and changes in the forward-looking estimates are analyzed. In this case it is forecast that economic conditions will deteriorate over the next year.

IE76. On that basis, Municipality M estimates the following provision matrix:

	Current	**1–30 days past due**	**31–60 days past due**	**61–90 days past due**	**More than 90 days past due**
Default rate	0.3 percent	1.6 percent	3.6 percent	6.6 percent	10.6 percent

IE77. The trade receivables from the large number of households amount to CU30 million and are measured using the provision matrix.

	Gross carrying amount	**Lifetime expected credit loss allowance (Gross carrying amount × lifetime expected credit loss rate)**
Current	CU15,000,000	CU45,000
1–30 days past due	CU7,500,000	CU120,000
31–60 days past due	CU4,000,000	CU144,000
61–90 days past due	CU2,500,000	CU165,000

	Gross carrying amount	Lifetime expected credit loss allowance (Gross carrying amount × lifetime expected credit loss rate)
More than 90 days past due	CU1,000,000	CU106,000
	CU30,000,000	**CU580,000**

Example 13—Debt Instrument Measured at Fair Value through Net Assets/Equity

IE78. Public Investment Fund A purchases a debt instrument with a fair value of CU1,000 on December 15, 20X0 and measures the debt instrument at fair value through net assets/equity. The instrument has an interest rate of 5 per cent over the contractual term of 10 years, and has a 5 per cent effective interest rate. At initial recognition the entity determines that the asset is not purchased or originated credit-impaired.

	Debit	Credit
Financial asset—Fair Value Through Net Assets/Equity	CU1,000	
Cash		CU1,000
(To recognize the debt instrument measured at its fair value)		

IE79. On December 31, 20X0 (the reporting date), the fair value of the debt instrument has decreased to CU950 as a result of changes in market interest rates. The entity determines that there has not been a significant increase in credit risk since initial recognition and that expected credit losses should be measured at an amount equal to 12-month expected credit losses, which amounts to CU30. For simplicity, journal entries for the receipt of interest revenue are not provided.

	Debit	Credit
Impairment loss (surplus or deficit)	CU30	
Net Assets/Equity[(a)]	CU20	
Financial asset—Fair Value Through Net Assets/Equity		CU50
(To recognize 12-month expected credit losses and other fair value changes on the debt instrument)		

(a) The cumulative loss in net assets/equity at the reporting date was CU20. That amount consists of the total fair value change of CU50 (i.e., CU1,000 – CU950) offset by the change in the accumulated impairment amount representing 12-month expected credit losses that was recognized (CU30).

IE80. Disclosure would be provided about the accumulated impairment amount of CU30.

IE81. On January 1, 20X1, the entity decides to sell the debt instrument for CU950, which is its fair value at that date.

	Debit	Credit
Cash	CU950	
Financial asset—Fair Value Through Net Assets/Equity		CU950

	Debit	Credit
Loss (surplus or deficit)	CU20	
Net Assets/Equity		CU20
(To derecognize the fair value through net assets/equity asset and recycle amounts accumulated in net assets/equity to surplus or deficit)		

Example 14—Interaction Between the Fair Value Through Net Assets/Equity Measurement Category and Foreign Currency Denomination, Fair Value Hedge Accounting and Impairment

IE82. This example illustrates the accounting relating to a debt instrument denominated in a foreign currency, measured at fair value through net assets/equity and designated in a fair value hedge accounting relationship. The example illustrates the interaction with accounting for impairment.

IE83. An entity purchases a debt instrument (a bond) denominated in a foreign currency (FC) for its fair value of FC100,000 on January 1, 20X0 and classifies the bond as measured at fair value through net assets/equity. The bond has five years remaining to maturity and a fixed coupon of 5 per cent over its contractual life on the contractual par amount of FC100,000. On initial recognition the bond has a 5 per cent effective interest rate. The entity's functional currency is its local currency (LC). The exchange rate is FC1 to LC1 on January 1, 20X0. At initial recognition the entity determines that the bond is not purchased or originated credit-impaired. In addition, as at January 1, 20X0 the 12-month expected credit losses are determined to be FC1,200. Its amortized cost in FC as at January 1, 20X0 is equal to its gross carrying amount of FC100,000 less the 12-month expected credit losses (FC100,000—FC1,200).

IE84. The entity has the following risk exposures:

(a) Fair value interest rate risk in FC: the exposure that arises as a result of purchasing a fixed interest rate instrument; and

(b) Foreign exchange risk: the exposure to changes in foreign exchange rates measured in LC.

IE85. The entity hedges its risk exposures using the following risk management strategy:

(a) For fixed interest rate risk (in FC) the entity decides to link its interest receipts in FC to current variable interest rates in FC. Consequently, the entity uses interest rate swaps denominated in FC under which it pays fixed interest and receives variable interest in FC; and

(b) For foreign exchange risk the entity decides not to hedge against any variability in LC arising from changes in foreign exchange rates.

IE86. The entity designates the following hedge relationship:[12] a fair value hedge of the bond in FC as the hedged item with changes in benchmark interest rate risk in FC as the hedged risk. The entity enters into an on-market swap that pays fixed and receives variable interest on the same day and designates the swap as the hedging instrument. The tenor of the swap matches that of the hedged item (i.e., five years).

IE87. For simplicity, in this example it is assumed that no hedge ineffectiveness arises in the hedge accounting relationship. This is because of the assumptions made in order to better focus on illustrating the accounting mechanics in a situation that entails measurement at fair value through net assets/equity of a foreign currency

[12] This example assumes that all qualifying criteria for hedge accounting are met (see paragraph 129 of IPSAS 41). The following description of the designation is solely for the purpose of understanding this example (i.e., it is not an example of the complete formal documentation required in accordance with paragraph 129 of IPSAS 41).

financial instrument that is designated in a fair value hedge relationship, and also to focus on the recognition of impairment gains or losses on such an instrument.

IE88. The entity makes the following journal entries to recognize the bond and the swap on January 1, 20X0:

	Debit LC	Credit LC
Financial asset—Fair Value Through Net Assets/Equity	100,000	
Cash		100,000
(To recognize the bond at its fair value)		
Impairment loss (surplus or deficit)	1,200	
Net Assets/Equity		1,200
(To recognize the 12-month expected credit losses)[(a)]		
Swap	–	
Cash		–
(To recognize the swap at its fair value)		

(a) In case of items measured in the functional currency of an entity the journal entry recognizing expected credit losses will usually be made at the reporting date.

IE89. As of December 31, 20X0 (the reporting date), the fair value of the bond decreased from FC100,000 to FC96,370 because of an increase in market interest rates. The fair value of the swap increased to FC1,837. In addition, as at December 31, 20X0 the entity determines that there has been no change to the credit risk on the bond since initial recognition and continues to carry a loss allowance for 12-month expected credit losses at FC1,200.[13] As at December 31, 20X0, the exchange rate is FC1 to LC1.4. This is reflected in the following table:

	January 1, 20X0	December 31, 20X0
Bond		
Fair value (FC)	100,000	96,370
Fair value (LC)	100,000	134,918
Amortised cost (FC)	98,800	98,800
Amortised cost (LC)	98,800	138,320
Interest rate swap		
Interest rate swap (FC)	–	1,837

[13] For the purposes of simplicity the example ignores the impact of discounting when computing expected credit losses.

	January 1, 20X0	December 31, 20X0
Interest rate swap (LC)	–	2,572
Impairment – loss allowance		
Loss allowance (FC)	1,200	1,200
Loss allowance (LC)	1,200	1,680
FX rate (FC:LC)	1:1	1:1.4

IE90. The bond is a monetary asset. Consequently, the entity recognizes the changes arising from movements in foreign exchange rates in surplus or deficit in accordance with paragraphs 27(a) and 32 of IPSAS 4, *The Effects of Changes in Foreign Exchange Rates* and recognizes other changes in accordance with IPSAS 41. For the purposes of applying paragraph 32 of IPSAS 4 the asset is treated as an asset measured at amortized cost in the foreign currency.

IE91. As shown in the table, on December 31, 20X0 the fair value of the bond is LC134,918 (FC96,370 × 1.4) and its amortized cost is LC138,320 (FC(100,000 –1,200) × 1.4).

IE92. The gain recognized in surplus or deficit that is due to the changes in foreign exchange rates is LC39,520 (LC138,320 – LC98,800), i.e., the change in the amortized cost of the bond during 20X0 in LC. The change in the fair value of the bond in LC, which amounts to LC34,918, is recognized as an adjustment to the carrying amount. The difference between the fair value of the bond and its amortized cost in LC is LC3,402 (LC134,918 – LC138,320). However, the change in the cumulative gain or loss recognized in net assets/equity during 20X0 as a reduction is LC 4,602 (LC3,402 + LC1,200).

IE93. A gain of LC2,572 (FC1,837 × 1.4) on the swap is recognized in surplus or deficit and, because it is assumed that there is no hedge ineffectiveness, an equivalent amount is recycled from net assets/equity in the same period. For simplicity, journal entries for the recognition of interest revenue are not provided. It is assumed that interest accrued is received in the period.

IE94. The entity makes the following journal entries on December 31, 20X0:

	Debit LC	Credit LC
Financial asset—Fair Value Through Net Assets/Equity	34,918	
Net Assets/Equity	4,602	
Surplus or deficit		39,520
(To recognize the foreign exchange gain on the bond, the adjustment to its carrying amount measured at fair value in LC and the movement in the accumulated impairment amount due to changes in foreign exchange rates)		
Swap	2,572	
Surplus or deficit		2,572
(To remeasure the swap at fair value)		

	Debit LC	Credit LC
Surplus or deficit	2,572	
Net Assets/Equity		2,572
(To recognize in surplus or deficit the change in fair value of the bond due to a change in the hedged risk)		

IE95. In accordance with paragraph 20A of IPSAS 30, the loss allowance for financial assets measured at fair value through net assets/equity is not presented separately as a reduction of the carrying amount of the financial asset. However, disclosure would be provided about the accumulated impairment amount recognized in net assets/equity.

IE96. As at December 31, 20X1 (the reporting date), the fair value of the bond decreased to FC87,114 because of an increase in market interest rates and an increase in the credit risk of the bond. The fair value of the swap increased by FC255 to FC2,092. In addition, as at December 31, 20X1 the entity determines that there has been a significant increase in credit risk on the bond since initial recognition, so a loss allowance at an amount equal to lifetime expected credit losses is recognized.[14] The estimate of lifetime expected credit losses as at December 31, 20X1 is FC9,700. As at December 31, 20X1, the exchange rate is FC1 to LC1.25. This is reflected in the following table:

	December 31, 20X0	December 31, 20X1
Bond		
Fair value (FC)	96,370	87,114
Fair value (LC)	134,918	108,893
Amortised cost (FC)	98,800	90,300
Amortised cost (LC)	138,320	112,875
Interest rate swap		
Interest rate swap (FC)	1,837	2,092
Interest rate swap (LC)	2,572	2,615
Impairment – loss allowance		
Loss allowance (FC)	1,200	9,700
Loss allowance (LC)	1,680	12,125
FX rate (FC:LC)	1:1.4	1:1.25

[14] For simplicity this example assumes that credit risk does not dominate the fair value hedge relationship.

IE97. As shown in the table, as at December 31, 20X1 the fair value of the bond is LC108,893 (FC87,114 × 1.25) and its amortized cost is LC112,875 (FC(100,000 – 9,700) × 1.25).

IE98. The lifetime expected credit losses on the bond are measured as FC9,700 as of December 31, 20X1. Thus the impairment loss recognized in surplus or deficit in LC is LC10,625 (FC(9,700 – 1,200) × 1.25).

IE99. The loss recognized in surplus or deficit because of the changes in foreign exchange rates is LC14,820 (LC112,875 – LC138,320 + LC10,625), which is the change in the gross carrying amount of the bond on the basis of amortized cost during 20X1 in LC, adjusted for the impairment loss. The difference between the fair value of the bond and its amortized cost in the functional currency of the entity on December 31, 20X1 is LC3,982 (LC108,893 – LC112,875). However, the change in the cumulative gain or loss recognized in net assets/equity during 20X1 as a reduction in net assets/equity is LC11,205 (LC3,982 – LC3,402 + LC10,625).

IE100. A gain of LC43 (LC2,615 – LC2,572) on the swap is recognized in surplus or deficit and, because it is assumed that there is no hedge ineffectiveness, an equivalent amount is recycled from net assets/equity in the same period.

IE101. The entity makes the following journal entries on December 31, 20X1:

	Debit LC	**Credit LC**
Financial asset—Fair Value Through Net Assets/Equity		26,025
Net Assets/Equity	11,205	
Surplus or deficit	14,820	
(To recognize the foreign exchange gain on the bond, the adjustment to its carrying amount measured at fair value in LC and the movement in the accumulated impairment amount due to changes in foreign exchange rates)		
Swap	43	
Surplus or deficit		43
(To remeasure the swap at fair value)		
Surplus or deficit	43	
Net Assets/Equity		43
(To recognize in surplus or deficit the change in fair value of the bond due to a change in the hedged risk)		
Surplus or deficit (impairment loss)	10,625	
Net Assets/Equity (accumulated impairment amount)		10,625
(To recognize lifetime expected credit losses)		

IE102. On January 1, 20X2, the entity decides to sell the bond for FC 87,114, which is its fair value at that date and also closes out the swap at fair value. The foreign exchange rate is the same as at December 31, 20X1. The journal entries to derecognize the bond and reclassify the gains and losses that have accumulated in net assets/equity would be as follows:

	Debit LC	Credit LC
Cash	108,893	
Financial asset—Fair Value Through Net Assets/Equity		108,893
Loss on sale (surplus or deficit)	1,367[(a)]	
Net Assets/Equity		1,367
(To derecognize the bond)		
Swap		2,615
Cash	2,615	
(To close out the swap)		

(a) This amount consists of the changes in fair value of the bond, the accumulated impairment amount and the changes in foreign exchange rates recognized in net assets/equity (LC2,572 + LC1,200 + LC43 + LC10,625 – LC4,602 – LC11,205 = -LC1,367, which is recycled as a loss in surplus or deficit).

Application of the Impairment Requirements on a Reporting Date

Reclassification of Financial Assets (Paragraphs 94–100)

IE103. This example illustrates the accounting requirements for the reclassification of financial assets between measurement categories in accordance with paragraphs 94–100 of IPSAS 41. The example illustrates the interaction with the impairment requirements in paragraphs 73–93 of IPSAS 41.

Example 15—Reclassification of Financial Assets

IE104. An entity purchases a portfolio of bonds for its fair value (gross carrying amount) of CU500,000.

IE105. The entity changes the management model for managing the bonds in accordance with paragraph 54 of IPSAS 41. The fair value of the portfolio of bonds at the reclassification date is CU490,000.

IE106. If the portfolio was measured at amortized cost or at fair value through net assets/equity immediately prior to reclassification, the loss allowance recognized at the date of reclassification would be CU6,000 (reflecting a significant increase in credit risk since initial recognition and thus the measurement of lifetime expected credit losses).

IE107. The 12-month expected credit losses at the reclassification date are CU4,000.

IE108. For simplicity, journal entries for the recognition of interest revenue are not provided.

Scenario 1: Reclassification Out of the Amortized Cost Measurement Category and into the Fair Value through Surplus or Deficit Measurement Category

IE109. Department of Treasury A reclassifies the portfolio of bonds out of the amortized cost measurement category and into the fair value through surplus or deficit measurement category. At the reclassification date, the portfolio of bonds is measured at fair value. Any gain or loss arising from a difference between the previous amortized cost amount of the portfolio of bonds and the fair value of the portfolio of bonds is recognized in surplus or deficit on reclassification.

	Debit	**Credit**
Bonds (Fair Value Through Surplus or Deficit assets)	CU490,000	
Bonds (gross carrying amount of the amortized cost assets)		CU500,000
Loss allowance	CU6,000	
Reclassification loss (surplus or deficit)	CU4,000	
(To recognize the reclassification of bonds from amortized cost to fair value through surplus or deficit and to derecognize the loss allowance.)		

Scenario 2: Reclassification Out of the Fair Value through Surplus or Deficit Measurement Category and into the Amortized Cost Measurement Category

IE110. Department of Treasury A reclassifies the portfolio of bonds out of the fair value through surplus or deficit measurement category and into the amortized cost measurement category. At the reclassification date, the fair value of the portfolio of bonds becomes the new gross carrying amount and the effective interest rate is determined based on that gross carrying amount. The impairment requirements apply to the bond from the reclassification date. For the purposes of recognizing expected credit losses, the credit risk of the portfolio of bonds at the reclassification date becomes the credit risk against which future changes in credit risk shall be compared.

	Debit	Credit
Bonds (gross carrying amount of the amortized cost assets)	CU490,000	
Bonds (Fair Value Through Surplus or Deficit assets)		CU490,000
Impairment loss (surplus or deficit)	CU4,000	
Loss allowance		CU4,000
(To recognize reclassification of bonds from fair value through surplus or deficit to amortized cost including commencing accounting for impairment.)		

Scenario 3: Reclassification Out of the Amortized Cost Measurement Category and into the Fair Value through Net Assets/Equity Measurement Category

IE111. Department of Treasury A reclassifies the portfolio of bonds out of the amortized cost measurement category and into the fair value through net assets/equity measurement category. At the reclassification date, the portfolio of bonds is measured at fair value. Any gain or loss arising from a difference between the previous amortized cost amount of the portfolio of bonds and the fair value of the portfolio of bonds is recognized in net assets/equity. The effective interest rate and the measurement of expected credit losses are not adjusted as a result of the reclassification. The credit risk at initial recognition continues to be used to assess changes in credit risk. From the reclassification date the loss allowance ceases to be recognized as an adjustment to the gross carrying amount of the bond and is recognized as an accumulated impairment amount, which would be disclosed.

	Debit	Credit
Bonds (Fair Value Through Net Assets/Equity assets)	CU490,000	
Bonds (gross carrying amount of amortized cost assets)		CU500,000
Loss allowance	CU6,000	
Net Assets/Equity [(a)]	CU4,000	
(To recognize the reclassification from amortized cost to fair value through net assets/equity. The measurement of expected credit losses is however unchanged.)		

(a) For simplicity, the amount related to impairment is not shown separately. If it had been, this journal entry (i.e., DR CU4,000) would be split into the following two entries: DR Net Assets/Equity CU10,000 (fair value changes) and CR Net Assets/Equity CU6,000 (accumulated impairment amount).

Scenario 4: Reclassification Out of the Fair Value through Net Assets/Equity Measurement Category and into the Amortized Cost Measurement Category

IE112. Department of Treasury A reclassifies the portfolio of bonds out of the fair value through net assets/equity measurement category and into the amortized cost measurement category. The portfolio of bonds is reclassified at fair value. However, at the reclassification date, the cumulative gain or loss previously recognized in net assets/equity is removed from net assets/equity and adjusted against the fair value of the portfolio of bonds. As a result, the portfolio of bonds is measured at the reclassification date as if it had always

been measured at amortized cost. The effective interest rate and the measurement of expected credit losses are not adjusted as a result of the reclassification. The credit risk at initial recognition continues to be used to assess changes in the credit risk on the bonds. The loss allowance is recognized as an adjustment to the gross carrying amount of the bond (to reflect the amortized cost amount) from the reclassification date.

	Debit	**Credit**
Bonds (gross carrying value of the amortized cost assets)	CU490,000	
Bonds (Fair Value Through Net Assets/Equity assets)		CU490,000
Bonds (gross carrying value of the amortized cost assets)	CU10,000	
Loss allowance		CU6,000
Net Assets/Equity [(a)]		CU4,000
(To recognize the reclassification from fair value through net assets/equity to amortized cost including the recognition of the loss allowance deducted to determine the amortized cost amount. The measurement of expected credit losses is however unchanged.)		

(a) The cumulative loss in net assets/equity at the reclassification date was CU4,000. That amount consists of the total fair value change of CU10,000 (i.e., CU500,000 – 490,000) offset by the accumulated impairment amount recognized (CU6,000) while the assets were measured at fair value through net assets/equity.

Scenario 5: Reclassification Out of the Fair Value through Surplus or Deficit Measurement Category and into the Fair Value Through Net Assets/Equity Measurement Category

IE113. Department of Treasury A reclassifies the portfolio of bonds out of the fair value through surplus or deficit measurement category and into the fair value through net assets/equity measurement category. The portfolio of bonds continues to be measured at fair value. However, for the purposes of applying the effective interest method, the fair value of the portfolio of bonds at the reclassification date becomes the new gross carrying amount and the effective interest rate is determined based on that new gross carrying amount. The impairment requirements apply from the reclassification date. For the purposes of recognizing expected credit losses, the credit risk of the portfolio of bonds at the reclassification date becomes the credit risk against which future changes in credit risk shall be compared.

	Debit	**Credit**
Bonds (Fair Value Through Net Assets/Equity assets)	CU490,000	
Bonds (Fair Value Through Surplus or Deficit assets)		CU490,000
Impairment loss (surplus or deficit)	CU4,000	
Net Assets/Equity		CU4,000
(To recognize the reclassification of bonds from fair value through surplus or deficit to fair value through net assets/equity including commencing accounting for impairment. The net assets/equity amount reflects the loss allowance at the date of reclassification (an accumulated impairment amount relevant for disclosure purposes) of CU4,000.)		

Scenario 6: Reclassification Out of the Fair Value through Net Assets/Equity Measurement Category and into the Fair Value Through Surplus or Deficit Measurement Category

IE114. Department of Treasury A reclassifies the portfolio of bonds out of the fair value through net assets/equity measurement category and into the fair value through surplus or deficit measurement category. The portfolio of bonds continues to be measured at fair value. However, the cumulative gain or loss previously recognized in net assets/equity is reclassified from net assets/equity to surplus or deficit as a reclassification adjustment (see IPSAS 1, *Presentation of Financial Statements*).

	Debit	Credit
Bonds (Fair Value Through Surplus or Deficit assets)	CU490,000	
Bonds (Fair Value Through Net Assets/Equity assets)		CU490,000
Reclassification loss (surplus or deficit)	CU4,000	
Net Assets/Equity [(a)]		CU4,000

(To recognize the reclassification of bonds from fair value through net assets/equity to fair value through surplus or deficit.)

(a) The cumulative loss in net assets/equity at the reclassification date was CU4,000. That amount consists of the total fair value change of CU10,000 (i.e., CU500,000 – 490,000) offset by the loss allowance that was recognized (CU6,000) while the assets were measured at fair value through net assets/equity.

Hedge Accounting for Aggregated Exposures

IE115. The following examples illustrate the mechanics of hedge accounting for aggregated exposures.

Example 16—Combined Commodity Price Risk and Foreign Currency Risk Hedge (Cash Flow Hedge/Cash Flow Hedge Combination)

Fact Pattern

IE116. Municipality A wants to hedge a highly probable forecast electricity purchase (which is expected to occur at the end of Period 5). Government A's functional currency is its Local Currency (LC). Electricity is traded in Foreign Currency (FC). Government A has the following risk exposures:

(a) Commodity price risk: the variability in cash flows for the purchase price, which results from fluctuations of the spot price of electricity in FC; and

(b) Foreign currency (FX) risk: the variability in cash flows that result from fluctuations of the spot exchange rate between LC and FC.

IE117. Municipality A hedges its risk exposures using the following risk management strategy:

(a) Municipality A uses benchmark commodity forward contracts, which are denominated in FC, to hedge its electricity purchases four periods before delivery. The electricity price that Municipality A actually pays for its purchase is different from the benchmark price because of differences in the type of electricity, the location and delivery arrangement.[15] This gives rise to the risk of changes in the relationship between the two electricity prices (sometimes referred to as 'basis risk'), which affects the

[15] For the purpose of this example it is assumed that the hedged risk is not designated based on a benchmark electricity price risk component. Consequently, the entire electricity price risk is hedged.

effectiveness of the hedging relationship. Municipality A does not hedge this risk because it is not considered economical under cost/benefit considerations.

(b) Municipality A also hedges its FX risk. However, the FX risk is hedged over a different horizon—only three periods before delivery. Municipality A considers the FX exposure from the variable payments for the electricity purchase in FC and the gain or loss on the commodity forward contract in FC as one aggregated FX exposure. Hence, Municipality A uses one single FX forward contract to hedge the FX cash flows from a forecast electricity purchase and the related commodity forward contract.

IE118. The following table sets out the parameters used for Example 16 (the 'basis spread' is the differential, expressed as a percentage, between the price of the electricity that Municipality A actually buys and the price for the benchmark electricity):

Example 16—Parameters

Period	**1**	**2**	**3**	**4**	**5**
Interest rates for remaining maturity [FC]	0.26%	0.21%	0.16%	0.06%	0.00%
Interest rates for remaining maturity [LC]	1.12%	0.82%	0.46%	0.26%	0.00%
Forward price [FC/MWh]	1.25	1.01	1.43	1.22	2.15
Basis spread	-5.00%	-5.50%	-6.00%	-3.40%	-7.00%
FX rate (spot) [FC/LC]	1.3800	1.3300	1.4100	1.4600	1.4300

Accounting Mechanics

IE119. Municipality A designates as cash flow hedges the following two hedging relationships:[16]

(a) A commodity price risk hedging relationship between the electricity price related variability in cash flows attributable to the forecast electricity purchase in FC as the hedged item and a commodity forward contract denominated in FC as the hedging instrument (the 'first level relationship'). This hedging relationship is designated at the end of Period 1 with a term to the end of Period 5. Because of the basis spread between the price of the electricity that Municipality A actually buys and the price for the benchmark electricity, Municipality A designates a volume of 112,500 MWh of electricity as the hedging instrument and a volume of 118,421 MWh as the hedged item.[17]

(b) An FX risk hedging relationship between the aggregated exposure as the hedged item and an FX forward contract as the hedging instrument (the 'second level relationship'). This hedging relationship is designated at the end of Period 2 with a term to the end of Period 5. The aggregated exposure that is designated as the hedged item represents the FX risk that is the effect of exchange rate changes, compared to the forward FX rate at the end of Period 2 (i.e., the time of designation of the FX risk

[16] This example assumes that all qualifying criteria for hedge accounting are met (see paragraph 129 of IPSAS 41). The following description of the designation is solely for the purpose of understanding this example (i.e., it is not an example of the complete formal documentation required in accordance with paragraph 129(b) of IPSAS 41).

[17] In this example, the current basis spread at the time of designation is coincidentally the same as Municipality A's long-term view of the basis spread (-5 per cent) that determines the volume of electricity purchases that it actually hedges. Also, this example assumes that Municipality A designates the hedging instrument in its entirety and designates as much of its highly probable forecast purchases as it regards as hedged. That results in a hedge ratio of 1/(100 percent -5 percent). Other entities might follow different approaches when determining what volume of their exposure they actually hedge, which can result in a different hedge ratio and also designating less than a hedging instrument in its entirety (see paragraph 129 of IPSAS 41).

hedging relationship), on the combined FX cash flows in FC of the two items designated in the commodity price risk hedging relationship, which are the forecast electricity purchase and the commodity forward contract. Municipality A's long-term view of the basis spread between the price of the electricity that it actually buys and the price for the benchmark electricity has not changed from the end of Period 1. Consequently, the actual volume of hedging instrument that Municipality A enters into (the nominal amount of the FX forward contract of FC140,625) reflects the cash flow exposure associated with a basis spread that had remained at -5 per cent. However, Municipality A's actual aggregated exposure is affected by changes in the basis spread. Because the basis spread has moved from -5 per cent to -5.5 per cent during Period 2, Municipality A's actual aggregated exposure at the end of Period 2 is FC140,027.

IE120. The following table sets out the fair values of the derivatives, the changes in the value of the hedged items and the calculation of the cash flow hedge reserves and hedge ineffectiveness:[18]

[18] In the following table for the calculations all amounts (including the calculations for accounting purposes of amounts for assets, liabilities, net assets/equity and surplus or deficit) are in the format of positive (plus) and negative (minus) numbers (e.g., a surplus or deficit amount that is a negative number is a loss).

Example 16—Calculations

Period			**1**	**2**	**3**	**4**	**5**
Commodity Price Risk Hedging Relationship (First Level Relationship)							
Forward Purchase Contract for Electricity							
Volume (MWh)	112,500						
Forward price [FC/ MWh]	1.25	Price (fwd) [FC/MWh]	1.25	1.01	1.43	1.22	2.15
Fair value [FC]			0	(26,943)	20,219	(3,373)	101,250
Fair value [LC]			0	(20,258)	14,339	(2,310)	70,804
Change in fair value [LC]				(20,258)	34,598	(16,650)	73,114
Hedged Forecast Electricity Purchase							
Hedge ratio	105.26%	Basis spread	-5.00%	-5.50%	-6.00%	-3.40%	-7.00%
Hedged volume	118,421	Price (fwd) [FC/MWh]	1.19	0.95	1.34	1.18	2.00
Implied forward price	1.1875	Present value [FC]	0	27,540	(18,528)	1,063	(96,158)
		Present value [LC]	0	20,707	(13,140)	728	(67,243)
Change in present value [LC]				20,707	(33,847)	13,868	(67,971)
Accounting			LC	LC	LC	LC	LC
Derivative			0	(20,258)	14,339	(2,310)	70,804
Cash flow hedge reserve			0	(20,258)	13,140	(728)	67,243
Change in cash flow hedge reserve				(20,258)	33,399	(13,868)	67,971
Surplus or deficit				0	1,199	(2,781)	5,143
Accumulated surplus or deficit			0	0	1,199	(1,582)	3,561
FX Risk Hedging Relationship (Second Level Relationship)							
FX rate [FC/LC]		Spot	1.3800	1.3300	1.4100	1.4600	1.4300
		Forward	1.3683	1.3220	1.4058	1.4571	1.4300
FX forward contract (Buy FC/Sell LC)							

Example 16—Calculations							
Period			**1**	**2**	**3**	**4**	**5**
Volume [FC]	140,625						
Forward rate (in P2)	1.3220	Fair value [LC]		0	(6,313)	(9,840)	(8,035)
Change in fair value [LC]					(6,313)	(3,528)	1,805
Hedged FX risk							
Aggregated FX exposure	Hedged volume [FC]			140,027	138,932	142,937	135,533
Present value [LC]				0	6,237	10,002	7,744
Change in present value [LC]					6,237	3,765	(2,258)
Accounting				LC	LC	LC	LC
Derivative				0	(6,313)	(9,840)	(8,035)
Cash flow hedge reserve				0	(6,237)	(9,840)	(7,744)
Change in cash flow hedge reserve					(6,237)	(3,604)	2,096
Surplus or deficit					(76)	76	(291)
Accumulated surplus or deficit				0	(76)	0	(291)

IE121. The commodity price risk hedging relationship is a cash flow hedge of a highly probable forecast transaction that starts at the end of Period 1 and remains in place when the FX risk hedging relationship starts at the end of Period 2, i.e., the first level relationship continues as a separate hedging relationship.

IE122. The volume of the aggregated FX exposure (in FC), which is the hedged volume of the FX risk hedging relationship, is the total of:[19]

(a) The hedged electricity purchase volume multiplied by the current forward price (this represents the expected spot price of the actual electricity purchase); and

(b) The volume of the hedging instrument (designated nominal amount) multiplied by the difference between the contractual forward rate and the current forward rate (this represents the expected price differential from benchmark electricity price movements in FC that Municipality A will receive or pay under the commodity forward contract).

IE123. The present value (in LC) of the hedged item of the FX risk hedging relationship (i.e., the aggregated exposure) is calculated as the hedged volume (in FC) multiplied by the difference between the forward FX

[19] For example, at the end of Period 3 the aggregated FX exposure is determined as: 118,421 MWh × 1.34 FC/MWh = FC159,182 for the expected price of the actual electricity purchase and 112,500 MWh × (1.25 [FC/ MWh] – 1.43 [FC/ MWh]) = FC(20,250) for the expected price differential under the commodity forward contract, which gives a total of FC138,932—the volume of the aggregated FX exposure at the end of Period 3.

rate at the measurement date and the forward FX rate at the designation date of the hedging relationship (i.e., the end of Period 2).[20]

IE124. Using the present value of the hedged item and the fair value of the hedging instrument, the cash flow hedge reserve and the hedge ineffectiveness are then determined (see paragraph 140 of IPSAS 41).

IE125. The following table shows the effect on Municipality A's statement of financial performance and its statement of financial position (for the sake of transparency the line items[21] are disaggregated on the face of the statements by the two hedging relationships, i.e., for the commodity price risk hedging relationship and the FX risk hedging relationship):

Example 16—Overview of Effect on Statements of Financial Performance and Financial Position *[All amounts in LC]*

Period	**1**	**2**	**3**	**4**	**5**
Statement of financial performance					
Hedge ineffectiveness					
Commodity hedge		0	(1,199)	2,781	(5,143)
FX hedge		0	76	(76)	291
Surplus or deficit	0	0	(1,123)	2,705	(4,852)
Statement of changes in net assets/equity					
Net assets/equity					
Commodity hedge		20,258	(33,399)	13,868	(67,971)
FX hedge		0	6,237	3,604	(2,096)
Total net assets/equity	0	20,258	(27,162)	17,472	(70,067)
Statement of financial position					
Commodity forward	0	(20,258)	14,339	(2,310)	70,804
FX forward		0	(6,313)	(9,840)	(8,035)
Total net assets	0	(20,258)	8,027	(12,150)	62,769

[20] For example, at the end of Period 3 the present value of the hedged item is determined as the volume of the aggregated exposure at the end of Period 3 (FC138,932) multiplied by the difference between the forward FX rate at the end of Period 3 (1/1.4058) and the forward FX rate and the time of designation (i.e., the end of Period 2: 1/1.3220) and then discounted using the interest rate (in LC) at the end of Period 3 with a term of 2 periods (i.e., until the end of Period 5 – 0.46 percent). The calculation is: FC138,932 × (1/(1.4058[FC/LC]) – 1/(1.3220 [FC/LC]))/(1 + 0.46 percent) = LC6,237.

[21] The line items used in this example are a possible presentation. Different presentation formats using different line items (including line items that include the amounts shown here) are also possible (IPSAS 30 sets out disclosure requirements for hedge accounting that include disclosures about hedge ineffectiveness, the carrying amount of hedging instruments and the cash flow hedge reserve).

Example 16—Overview of Effect on Statements of Financial Performance and Financial Position *[All amounts in LC]*

Period	**1**	**2**	**3**	**4**	**5**
Net assets/equity					
Net assets/equity					
Commodity hedge	0	20,258	(13,140)	728	(67,243)
FX hedge		0	6,237	9,840	7,744
	0	20,258	(6,904)	10,568	(59,499)
Accumulated surplus or deficit					
Commodity hedge	0	0	(1,199)	1,582	(3,561)
FX hedge		0	76	0	291
	0	0	(1,123)	1,582	(3,270)
Total net assets/equity	0	20,258	(8,027)	12,150	(62,769)

IE126. The total cost of inventory after hedging is as follows:[22]

Cost of inventory [all amounts in LC]	
Cash price (at spot for commodity price risk and FX risk)	165,582
Gain/loss from CFHR for commodity price risk	(67,243)
Gain/loss from CFHR for FX risk	7,744
Cost of inventory	106,083

IE127. The total overall cash flow from all transactions (the actual electricity purchase at the spot price and the settlement of the two derivatives) is LC102,813. It differs from the hedge adjusted cost of inventory by LC3,270, which is the net amount of cumulative hedge ineffectiveness from the two hedging relationships. This hedge ineffectiveness has a cash flow effect but is excluded from the measurement of the inventory.

[22] 'CFHR' is the cash flow hedge reserve, i.e., the amount accumulated in net assets/equity for a cash flow hedge.

Example 17—Combined Interest Rate Risk and Foreign Currency Risk Hedge (Fair Value Hedge/Cash Flow Hedge Combination)

Fact Pattern

IE128. State Government B wants to hedge a fixed rate liability that is denominated in Foreign Currency (FC). The liability has a term of four periods from the start of Period 1 to the end of Period 4. State Government B's functional currency is its Local Currency (LC). State Government B has the following risk exposures:

(a) Fair value interest rate risk and FX risk: the changes in fair value of the fixed rate liability attributable to interest rate changes, measured in LC.

(b) Cash flow interest rate risk: the exposure that arises as a result of swapping the combined fair value interest rate risk and FX risk exposure associated with the fixed rate liability (see (a) above) into a variable rate exposure in LC in accordance with State Government B's risk management strategy for FC denominated fixed rate liabilities (see paragraph 129(a) below).

IE129. State Government B hedges its risk exposures using the following risk management strategy:

(a) State Government B uses cross-currency interest rate swaps to swap its FC denominated fixed rate liabilities into a variable rate exposure in LC. State Government B hedges its FC denominated liabilities (including the interest) for their entire life. Consequently, State Government B enters into a cross-currency interest rate swap at the same time as it issues an FC denominated liability. Under the cross-currency interest rate swap State Government B receives fixed interest in FC (used to pay the interest on the liability) and pays variable interest in LC.

(b) State Government B considers the cash flows on a hedged liability and on the related cross-currency interest rate swap as one aggregated variable rate exposure in LC. From time to time, in accordance with its risk management strategy for variable rate interest rate risk (in LC), State Government B decides to lock in its interest payments and hence swaps its aggregated variable rate exposure in LC into a fixed rate exposure in LC. State Government B seeks to obtain as a fixed rate exposure a single blended fixed coupon rate (i.e., the uniform forward coupon rate for the hedged term that exists at the start of the hedging relationship).[23] Consequently, State Government B uses interest rate swaps (denominated entirely in LC) under which it receives variable interest (used to pay the interest on the pay leg of the cross-currency interest rate swap) and pays fixed interest.

IE130. The following table sets out the parameters used for Example 17:

Example 17—Parameters

	t0	Period 1	Period 2	Period 3	Period 4
FX spot rate [LC/FC]	1.2000	1.0500	1.4200	1.5100	1.3700
Interest curves (vertical presentation of rates for each quarter of a period on a p.a. basis)					

[23] An entity may have a different risk management strategy whereby it seeks to obtain a fixed rate exposure that is not a single blended rate but a series of forward rates that are each fixed for the respective individual interest period. For such a strategy the hedge effectiveness is measured based on the difference between the forward rates that existed at the start of the hedging relationship and the forward rates that exist at the effectiveness measurement date for the individual interest periods. For such a strategy a series of forward contracts corresponding with the individual interest periods would be more effective than an interest rate swap (that has a fixed payment leg with a single blended fixed rate).

Example 17—Parameters

	t0	Period 1	Period 2	Period 3	Period 4
LC	2.50%	5.02%	6.18%	0.34%	[N/A]

Accounting Mechanics

IE131. State Government B designates the following hedging relationships:[24]

(a) As a fair value hedge, a hedging relationship for fair value interest rate risk and FX risk between the FC denominated fixed rate liability (fixed rate FX liability) as the hedged item and a cross-currency interest rate swap as the hedging instrument (the 'first level relationship'). This hedging relationship is designated at the beginning of Period 1 (i.e., t0) with a term to the end of Period 4.

(b) As a cash flow hedge, a hedging relationship between the aggregated exposure as the hedged item and an interest rate swap as the hedging instrument (the 'second level relationship'). This hedging relationship is designated at the end of Period 1, when State Government B decides to lock in its interest payments and hence swaps its aggregated variable rate exposure in LC into a fixed rate exposure in LC, with a term to the end of Period 4. The aggregated exposure that is designated as the hedged item represents, in LC, the variability in cash flows that is the effect of changes in the combined cash flows of the two items designated in the fair value hedge of the fair value interest rate risk and FX risk (see (a) above), compared to the interest rates at the end of Period 1 (i.e., the time of designation of the hedging relationship between the aggregated exposure and the interest rate swap).

IE132. The following table[25] sets out the overview of the fair values of the derivatives, the changes in the value of the hedged items and the calculation of the cash flow hedge reserve and hedge ineffectiveness.[26] In this example, hedge ineffectiveness arises on both hedging relationships.[27]

Example 17—Calculations					
	t_0	**Period 1**	**Period 2**	**Period 3**	**Period 4**
Fixed rate FX liability					

[24] This example assumes that all qualifying criteria for hedge accounting are met (see paragraph 129 of IPSAS 41). The following description of the designation is solely for the purpose of understanding this example (i.e., it is not an example of the complete formal documentation required in accordance with paragraph 129(b) of IPSAS 41.

[25] Tables in this example use the following acronyms: 'CCIRS' for cross-currency interest rate swap, 'CF(s)' for cash flow(s), 'CFH' for cash flow hedge, 'CFHR' for cash flow hedge reserve, 'FVH' for fair value hedge, 'IRS' for interest rate swap and 'PV' for present value.

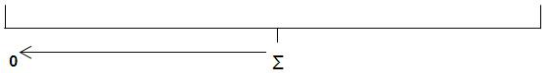
[26] In the following table for the calculations all amounts (including the calculations for accounting purposes of amounts for assets, liabilities and equity) are in the format of positive (plus) and negative (minus) numbers (e.g., an amount in the cash flow hedge reserve that is in brackets is a loss).

[27] For a situation such as in this example, hedge ineffectiveness can result from various factors, for example credit risk, differences in the day count method or, depending on whether it is included in the designation of the hedging instrument, the charge for exchanging different currencies that is included in cross-currency interest rate swaps (commonly referred to as the 'currency basis').

Example 17—Calculations

	t_0	Period 1	Period 2	Period 3	Period 4
Fair value [FC]	(1,000,000)	(995,522)	(1,031,008)	(1,030,193)	(1,000,000)
Fair value [LC]	(1,200,000)	(1,045,298)	(1,464,031)	(1,555,591)	(1,370,000)
Change in fair value [LC]		154,702	(418,733)	(91,560)	185,591
CCIRS (receive fixed FC/pay variable LC)					
Fair value [LC]	0	(154,673)	264,116	355,553	170,000
Change in fair value [LC]		(154,673)	418,788	91,437	(185,553)
IRS (receive variable/pay fixed)					
Fair value [LC]		0	18,896	(58,767)	0
Change in fair value [LC]			18,896	(77,663)	(58,767)
CF variability of the aggregated exposure					
Present value [LC]		0	(18,824)	58,753	0
Change in present value [LC]			(18,824)	77,577	(58,753)
CFHR					
Balance (end of period) [LC]		0	18,824	(58,753)	0
Change [LC]			18,824	(77,577)	58,753

IE133. The hedging relationship between the fixed rate FX liability and the cross-currency interest rate swap starts at the beginning of Period 1 (i.e., t_0) and remains in place when the hedging relationship for the second level relationship starts at the end of Period 1, i.e., the first level relationship continues as a separate hedging relationship.



IE134. The cash flow variability of the aggregated exposure is calculated as follows:

(a) At the point in time from which the cash flow variability of the aggregated exposure is hedged (i.e., the start of the second level relationship at the end of Period 1), all cash flows expected on the fixed rate FX liability and the cross-currency interest rate swap over the hedged term (i.e., until the end of Period 4) are mapped out and equated to a single blended fixed coupon rate so that the total present value (in LC) is nil. This calculation establishes the single blended fixed coupon rate (reference rate) that is used at subsequent dates as the reference point to measure the cash flow variability of the aggregated exposure since the start of the hedging relationship. This calculation is illustrated in the following table:

Example 17—Cash Flow Variability of the Aggregated Exposure (Calibration)

		Variability in Cash Flows of the Aggregated Exposure							
		FX liability		CCIRS FC leg		CCIRS LC leg		Calibration	PV
		CF(s)	PV	CF(s)	PV	CF(s)	PV	1,200,000 5.6963 percent 4 Frequency	Nominal Rate

Totals in LC			(1,045,298)		1,045,327		(1,200,000)		1,199,971

PV of all CF(s) [LC]

The nominal amount that is used for the calibration of the reference rate is the same as the nominal amount of aggregated exposure that creates the variable cash flows in LC (LC1,200,000), which coincides with the nominal amount of the cross-currency interest rate swap for the variable rate leg in LC. This results in a reference rate of 5.6963 per cent (determined by iteration so that the present value of all cash flows in total is nil).

(b) At subsequent dates, the cash flow variability of the aggregated exposure is determined by comparison to the reference point established at the end of Period 1. For that purpose, all remaining cash flows expected on the fixed rate FX liability and the cross-currency interest rate swap over the remainder of the hedged term (i.e., from the effectiveness measurement date until the end of Period 4) are updated (as applicable) and then discounted. Also, the reference rate of 5.6963 per cent is applied to the nominal amount that was used for the calibration of that rate at the end of Period 1 (LC1,200,000) in order to generate a set of cash flows over the remainder of the hedged term that is then also discounted. The total of all those present values represents the cash flow variability of the aggregated exposure. This calculation is illustrated in the following table for the end of Period 2:

Example 17—Cash Flow Variability of the Aggregated Exposure (at the End of Period 2)

		Variability in Cash Flows of the Aggregated Exposure							
		FX liability		CCIRS FC leg		CCIRS LC leg		Calibration	PV
		CF(s)	PV	CF(s)	PV	CF(s)	PV	1,200,000	Nominal 5.6963 percent Rate 4 Frequency

PV of all CF(s) [LC]

The changes in interest rates and the exchange rate result in a change of the cash flow variability of the aggregated exposure between the end of Period 1 and the end of Period 2 that has a present value of LC-18,824.[28]

IE135. Using the present value of the hedged item and the fair value of the hedging instrument, the cash flow hedge reserve and the hedge ineffectiveness are then determined (see paragraph 140 of IPSAS 41).

IE136. The following table shows the effect on State Government B's statement of financial performance and its statement of financial position (for the sake of transparency some line items[29] are disaggregated on the face of the statements by the two hedging relationships, i.e., for the fair value hedge of the fixed rate FX liability and the cash flow hedge of the aggregated exposure):[30]

[28] This is the amount that is included in the table with the overview of the calculations (see paragraph IE132) as the present value of the cash flow variability of the aggregated exposure at the end of Period 2.

[29] The line items used in this example are a possible presentation. Different presentation formats using different line items (including line items that include the amounts shown here) are also possible (IPSAS 30 sets out disclosure requirements for hedge accounting that include disclosures about hedge ineffectiveness, the carrying amount of hedging instruments and the cash flow hedge reserve).

[30] For Period 4 the values in the table with the overview of the calculations (see paragraph IE132) differ from those in the following table. For Periods 1 to 3 the 'dirty' values (i.e., including interest accruals) equal the 'clean' values (i.e., excluding interest accruals) because the period end is a settlement date for all legs of the derivatives and the fixed rate FX liability. At the end of Period 4 the table with the overview of the calculations uses clean values in order to calculate the value changes consistently over time. For the following table the dirty values are presented, i.e., the maturity amounts including accrued interest immediately before the instruments are settled (this is for illustrative purposes as otherwise all carrying amounts other than cash and accumulated surplus or deficit would be nil).

Example 17—Overview of Effect on Statements of Financial Performance and Financial Position *[All amounts in LC]*

	t_0	Period 1	Period 2	Period 3	Period 4
Statement of financial performance					
Interest expense					
FX liability		45,958	50,452	59,848	58,827

IE137. The total interest expense in surplus or deficit reflects State Government B's interest expense that results from its risk management strategy:

(a) In Period 1 the risk management strategy results in interest expense reflecting variable interest rates in LC after taking into account the effect of the cross-currency interest rate swap, including a difference between the cash flows on the fixed rate FX liability and the fixed leg of the cross-currency interest rate swap that were settled during Period 1 (this means the interest expense does not exactly equal the variable interest expense that would arise in LC on a borrowing of LC1,200,000). There is also some hedge ineffectiveness that results from a difference in the changes in value for the fixed rate FX liability (as represented by the fair value hedge adjustment) and the cross-currency interest rate swap.

(b) For Periods 2 to 4 the risk management strategy results in interest expense that reflects, after taking into account the effect of the interest rate swap entered into at the end of Period 1, fixed interest rates in LC (i.e., locking in a single blended fixed coupon rate for a three-period term based on the interest rate environment at the end of Period 1). However, State Government B's interest expense is affected by the hedge ineffectiveness that arises on its hedging relationships. In Period 2 the interest expense is slightly higher than the fixed rate payments locked in with the interest rate swap because the variable payments received under the interest rate swap are less than the total of the cash flows resulting from the aggregated exposure.[31] In Periods 3 and 4 the interest expense is equal to the locked in rate because the variable payments received under the swap are more than the total of the cash flows resulting from the aggregated exposure.[32]

Example 18—Combined Interest Rate Risk and Foreign Currency Risk Hedge (Cash Flow Hedge/Fair Value Hedge Combination)

Fact Pattern

IE138. State Government C wants to hedge a variable rate liability that is denominated in Foreign Currency (FC). The liability has a term of four periods from the start of Period 1 to the end of Period 4. State Government C's functional currency is its Local Currency (LC). State Government C has the following risk exposures:

[31] In other words, the cash flow variability of the interest rate swap was lower than, and therefore did not fully offset, the cash flow variability of the aggregated exposure as a whole (sometimes called an 'underhedge' situation). In those situations the cash flow hedge does not contribute to the hedge ineffectiveness that is recognized in surplus or deficit because the hedge ineffectiveness is not recognized (see paragraph 140 of IPSAS 41). The hedge ineffectiveness arising on the fair value hedge affects surplus or deficit in all periods.

[32] In other words, the cash flow variability of the interest rate swap was higher than, and therefore more than fully offset, the cash flow variability of the aggregated exposure as a whole (sometimes called an 'overhedge' situation). In those situations the cash flow hedge contributes to the hedge ineffectiveness that is recognized in surplus or deficit (see paragraph 140 of IPSAS 41). The hedge ineffectiveness arising on the fair value hedge affects surplus or deficit in all periods.

(a) Cash flow interest rate risk and FX risk: the changes in cash flows of the variable rate liability attributable to interest rate changes, measured in LC.

(b) Fair value interest rate risk: the exposure that arises as a result of swapping the combined cash flow interest rate risk and FX risk exposure associated with the variable rate liability (see (a) above) into a fixed rate exposure in LC in accordance with State Government C's risk management strategy for FC denominated variable rate liabilities (see paragraph 139(a) below).

IE139. State Government C hedges its risk exposures using the following risk management strategy:

(a) State Government C uses cross-currency interest rate swaps to swap its FC denominated variable rate liabilities into a fixed rate exposure in LC. State Government C hedges its FC denominated liabilities (including the interest) for their entire life. Consequently, State Government C enters into a cross-currency interest rate swap at the same time as it issues an FC denominated liability. Under the cross-currency interest rate swap State Government C receives variable interest in FC (used to pay the interest on the liability) and pays fixed interest in LC.

(b) State Government C considers the cash flows on a hedged liability and on the related cross-currency interest rate swap as one aggregated fixed rate exposure in LC. From time to time, in accordance with its risk management strategy for fixed rate interest rate risk (in LC), State Government C decides to link its interest payments to current variable interest rate levels and hence swaps its aggregated fixed rate exposure in LC into a variable rate exposure in LC. Consequently, State Government C uses interest rate swaps (denominated entirely in LC) under which it receives fixed interest (used to pay the interest on the pay leg of the cross-currency interest rate swap) and pays variable interest.

IE140. The following table sets out the parameters used for Example 18:

Example 18—Parameter Overview

	t_0	Period 1	Period 2	Period 3	Period 4
FX spot rate [LC/FC]	1.2	1.05	1.42	1.51	1.37
Interest curves (vertical presentation of rates for each quarter of a period on a p.a. basis)					
LC	2.50%	1.00%	3.88%	0.34%	[N/A]
	2.75%	1.21%	4.12%	0.49%

Accounting Mechanics

IE141. State Government C designates the following hedging relationships:[33]

(a) As a cash flow hedge, a hedging relationship for cash flow interest rate risk and FX risk between the FC denominated variable rate liability (variable rate FX liability) as the hedged item and a cross-currency interest rate swap as the hedging instrument (the 'first level relationship'). This hedging relationship is designated at the beginning of Period 1 (i.e., t_0) with a term to the end of Period 4.

(b) As a fair value hedge, a hedging relationship between the aggregated exposure as the hedged item and an interest rate swap as the hedging instrument (the 'second level relationship'). This hedging relationship is designated at the end of Period 1, when State Government C decides to link its interest payments to current variable interest rate levels and hence swaps its aggregated fixed rate exposure in LC into a variable rate exposure in LC, with a term to the end of Period 4. The aggregated exposure that is designated as the hedged item represents, in LC, the change in value that is the effect of changes in the value of the combined cash flows of the two items designated in the cash flow hedge of the cash flow interest rate risk and FX risk (see (a) above), compared to the interest rates at the end of Period 1 (i.e., the time of designation of the hedging relationship between the aggregated exposure and the interest rate swap).

IE142. The following table[34] sets out the overview of the fair values of the derivatives, the changes in the value of the hedged items and the calculation of the cash flow hedge reserve.[35] In this example no hedge ineffectiveness arises on either hedging relationship because of the assumptions made.[36]

Example 18—Calculations

	t_0	Period 1	Period 2	Period 3	Period 4
Variable rate FX liability					
Fair value [FC]	(1,000,000)	(1,000,000)	(1,000,000)	(1,000,000)	(1,000,000)
Fair value [LC]	(1,200,000)	(1,050,000)	(1,420,000)	(1,510,000)	(1,370,000)
Change in fair value [LC]		150,000	(370,000)	(90,000)	140,000
PV of change in variable CF(s) [LC]	0	192,310	(260,346)	(282,979)	(170,000)
Change in PV [LC]		192,310	(452,656)	(22,633)	112,979

[33] This example assumes that all qualifying criteria for hedge accounting are met (see paragraph 129 of IPSAS 41). The following description of the designation is solely for the purpose of understanding this example (i.e., it is not an example of the complete formal documentation required in accordance with paragraph 129(b) of IPSAS 41).

[34] Tables in this example use the following acronyms: 'CCIRS' for cross-currency interest rate swap, 'CF(s)' for cash flow(s), 'CFH' for cash flow hedge, 'CFHR' for cash flow hedge reserve, 'FVH' for fair value hedge, 'IRS' for interest rate swap and 'PV' for present value.

[35] In the following table for the calculations all amounts (including the calculations for accounting purposes of amounts for assets, liabilities and net assets/equity) are in the format of positive (plus) and negative (minus) numbers (e.g., an amount in the cash flow hedge reserve that is a negative number is a loss).

[36] Those assumptions have been made for didactical reasons, in order to better focus on illustrating the accounting mechanics in a cash flow hedge/fair value hedge combination. The measurement and recognition of hedge ineffectiveness has already been demonstrated in Example 16 and Example 17. However, in reality such hedges are typically not perfectly effective because hedge ineffectiveness can result from various factors, for example credit risk, differences in the day count method or, depending on whether it is included in the designation of the hedging instrument, the charge for exchanging different currencies that is included in cross-currency interest rate swaps (commonly referred to as the 'currency basis').

Example 18—Calculations					
	t_0	**Period 1**	**Period 2**	**Period 3**	**Period 4**
CCIRS (receive variable FC/pay fixed LC)					
Fair value [LC]	0	(192,310)	260,346	282,979	170,000
Change in fair value [LC]		(192,310)	452,656	22,633	(112,979)
CFHR					
Opening balance	0	0	(42,310)	(28,207)	(14,103)
Reclassification FX risk		153,008	(378,220)	(91,030)	140,731
Reclassification (current period CF)		(8,656)	(18,410)	2,939	21,431
Effective CFH gain/loss		(186,662)	(479,286)	20,724	(135,141)
Reclassification for interest rate risk		0	(82,656)	67,367	(27,021)
Amortization of CFHR		0	14,103	14,103	14,103
Ending balance		(42,103)	(28,207)	(14,103)	0
IRS (receive fixed/pay variable)					
Fair value [LC]		0	(82,656)	(15,289)	(42,310)
Change in fair value			(82,656)	67,367	(27,021)
Change in present value of the aggregated exposure					
Present value [LC]		(1,242,310)	(1,159,654)	(1,227,021)	(1,200,000)
Change in present value [LC]			82,656	(67,367)	27,021

IE143. The hedging relationship between the variable rate FX liability and the cross-currency interest rate swap starts at the beginning of Period 1 (i.e., t0) and remains in place when the hedging relationship for the second level relationship starts at the end of Period 1, i.e., the first level relationship continues as a separate hedging relationship. However, the hedge accounting for the first level relationship is affected by the start of hedge accounting for the second level relationship at the end of Period 1. The fair value hedge for the second level relationship affects the timing of the reclassification to surplus or deficit of amounts from the cash flow hedge reserve for the first level relationship:

(a) The fair value interest rate risk that is hedged by the fair value hedge is included in the amount that is recognized in net assets/ equity as a result of the cash flow hedge for the first level hedging relationship (i.e., the gain or loss on the cross-currency interest rate swap that is determined to be an effective hedge).[37] This means that from the end of Period 1 the part of the effective cash flow hedging gain or

[37] As a consequence of hedging its exposure to cash flow interest rate risk by entering into the cross-currency interest rate swap that changed the cash flow interest rate risk of the variable rate FX liability into a fixed rate exposure (in LC), State Government C in effect assumed an exposure

loss that represents the fair value interest rate risk (in LC), and is recognized in net assets/equity in a first step, is in a second step immediately (i.e., in the same period) transferred from the cash flow hedge reserve to surplus or deficit. That reclassification adjustment offsets the gain or loss on the interest rate swap that is recognized in surplus or deficit.[38] In the context of accounting for the aggregated exposure as the hedged item, that reclassification adjustment is the equivalent of a fair value hedge adjustment because in contrast to a hedged item that is a fixed rate debt instrument (in LC) at amortized cost, the aggregated exposure is already remeasured for changes regarding the hedged risk but the resulting gain or loss is recognized in net assets/equity because of applying cash flow hedge accounting for the first level relationship. Consequently, applying fair value hedge accounting with the aggregated exposure as the hedged item does not result in changing the hedged item's measurement but instead affects where the hedging gains and losses are recognized (i.e., reclassification from the cash flow hedge reserve to surplus or deficit).

(b) The amount in the cash flow hedge reserve at the end of Period 1 (LC42,310) is amortized over the remaining life of the cash flow hedge for the first level relationship (i.e., over Periods 2 to 4).[39]

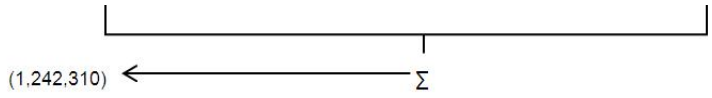
IE144. The change in value of the aggregated exposure is calculated as follows:

(a) At the point in time from which the change in value of the aggregated exposure is hedged (i.e., the start of the second level relationship at the end of Period 1), all cash flows expected on the variable rate FX liability and the cross-currency interest rate swap over the hedged term (i.e., until the end of Period 4) are mapped out and their combined present value, in LC, is calculated. This calculation establishes the present value that is used at subsequent dates as the reference point to measure the change in present value of the aggregated exposure since the start of the hedging relationship. This calculation is illustrated in the following table:

Example 18—Present Value of the Aggregated Exposure (Starting Point)

		Present Value of the Aggregated Exposure					
		FX liability		**CCIRS FC leg**		**CCIRS LC leg**	
		CF(s) [FC]	**PV [FC]**	**CF(s) [FC]**	**PV [FC]**	**CF(s) [LC]**	**PV [LC]**
	Time						
	t_0						
Period 1	t_1						
	t_2						
	t_3						
	t_4						

to fair value interest rate risk (see paragraph IE139).



[38] In the table with the overview of the calculations (see paragraph IE142) this reclassification adjustment is the line item "Reclassification for interest rate risk" in the reconciliation of the cash flow hedge reserve (e.g., at the end of Period 2 a reclassification of a gain of LC82,656 from the cash flow hedge reserve to surplus or deficit—see paragraph IE144 for how that amount is calculated).

[39] In the table with the overview of the calculations (see paragraph IE142) this amortization results in a periodic reclassification adjustment of LC14,103 that is included in the line item "Amortization of CFHR" in the reconciliation of the cash flow hedge reserve.

Example 18—Present Value of the Aggregated Exposure (Starting Point)

		Present Value of the Aggregated Exposure					
		FX liability		CCIRS FC leg		CCIRS LC leg	
		CF(s) [FC]	PV [FC]	CF(s) [FC]	PV [FC]	CF(s) [LC]	PV [LC]

	Totals		(1,000,000)		1,000,000		(1,242,310)
	Totals in LC		(1,050,000)		1,050,000		(1,242,310)

PV of aggregated exposure [LC]

The present value of all cash flows expected on the variable rate FX liability and the cross-currency interest rate swap over the hedged term at the end of Period 1 is LC-1,242,310.[40]

(b) At subsequent dates, the present value of the aggregated exposure is determined in the same way as at the end of Period 1 but for the remainder of the hedged term. For that purpose, all remaining cash flows expected on the variable rate FX liability and the cross-currency interest rate swap over the remainder of the hedged term (i.e., from the effectiveness measurement date until the end of Period 4) are updated (as applicable) and then discounted. The total of those present values represents the

[40] In this example no hedge ineffectiveness arises on either hedging relationship because of the assumptions made (see paragraph IE142). Consequently, the absolute values of the variable rate FX liability and the FC denominated leg of the cross-currency interest rate are equal (but with opposite signs). In situations in which hedge ineffectiveness arises, those absolute values would not be equal so that the remaining net amount would affect the present value of the aggregated exposure.

present value of the aggregated exposure. This calculation is illustrated in the following table for the end of Period 2:

Example 18—Present Value of the Aggregated Exposure (at the End of Period 2)

		Present Value of the Aggregated Exposure					
		FX liability		CCIRS FC leg		CCIRS LC leg	
		CF(s) [FC]	PV [FC]	CF(s) [FC]	PV [FC]	CF(s) [LC]	PV [LC]

	t_{15}	(6,975)	(6,689)	6,975	6,689	(9,117)	(8,397)
	t_{16}	(1,007,725)	(959,056)	1,007,725	956,056	(1,209,117)	(1,098,568)
	Totals		(1,000,000)		1,000,000		(1,159,654)
	Totals in LC		(1,420,000)		1,420,000		(1,159,654)

PV of aggregated exposure [LC]

(1,159,654) $\leftarrow \sum^{I}$

The changes in interest rates and the exchange rate result in a present value of the aggregated exposure at the end of Period 2 of LC-1,159,654. Consequently, the change in the present value of the aggregated exposure between the end of Period 1 and the end of Period 2 is a gain of LC82,656.[41]

IE145. Using the change in present value of the hedged item (i.e., the aggregated exposure) and the fair value of the hedging instrument (i.e., the interest rate swap), the related reclassifications from the cash flow hedge reserve to surplus or deficit (reclassification adjustments) are then determined.

IE146. The following table shows the effect on State Government C's statement of financial performance and its statement of financial position (for the sake of transparency some line items[42] are disaggregated on the face of the statements by the two hedging relationships, i.e., for the cash flow hedge of the variable rate FX liability and the fair value hedge of the aggregated exposure):[43]

Example 18—Overview of Effect on Statements of Financial Performance and Financial Position *[All amounts in LC]*

	t_0	Period 1	Period 2	Period 3	Period 4
Statement of financial performance					
Interest expense					
FX liability		45,122	54,876	33,527	15,035
FVH adjustment		0	(20,478)	16,517	(26,781)
		45,122	34,398	50,045	(11,746)
Reclassifications (CFH)		(8,656)	(18,410)	2,939	21,431
		36,466	15,989	52,983	9,685
Amortization of CFHR		0	14,103	14,103	14,103
Total interest expense		36,466	30,092	67,087	23,788
Other gains/losses					
IRS		0	82,656	(67,367)	27,021
FX gain/loss (liability)		(150,000)	370,000	90,000	(140,000)
FX gain/loss (interest)		(3,008)	8,220	1,030	(731)

41 This is the amount that is included in the table with the overview of the calculations (see paragraph IE142) as the change in present value of the aggregated exposure at the end of Period 2.

42 The line items used in this example are a possible presentation. Different presentation formats using different line items (including line items that include the amounts shown here) are also possible (IPSAS 30 sets out disclosure requirements for hedge accounting that include disclosures about hedge ineffectiveness, the carrying amount of hedging instruments and the cash flow hedge reserve).

43 For Period 4 the values in the table with the overview of the calculations (see paragraph IE142) differ from those in the following table. For Periods 1 to 3 the 'dirty' values (i.e., including interest accruals) equal the 'clean' values (i.e., excluding interest accruals) because the period end is a settlement date for all legs of the derivatives and the fixed rate FX liability. At the end of Period 4 the table with the overview of the calculations uses clean values in order to calculate the value changes consistently over time. For the following table the dirty values are presented, i.e., the maturity amounts including accrued interest immediately before the instruments are settled (this is for illustrative purposes as otherwise all carrying amounts other than cash and accumulated surplus or deficit would be nil).

Example 18—Overview of Effect on Statements of Financial Performance and Financial Position *[All amounts in LC]*

	t_0	Period 1	Period 2	Period 3	Period 4
Reclassification for FX risk		153,008	(378,220)	(91,030)	140,731
Reclassification for interest rate risk		0	(82,656)	67,367	(27,021)
Total other gains/losses		0	0	0	0
Surplus or deficit		36,466	30,092	67,087	23,788
Statement of changes in net assets/equity					
Net assets/equity					
Effective gain/loss		186,662	(479,286)	(20,724)	135,141
Reclassification (current period CF)		8,656	18,410	(2,939)	(21,431)
Reclassification for FX risk		(153,008)	378,220	91,030	(140,731)
Reclassification for interest rate risk		0	82,656	(67,367)	27,021
Amortization of CFHR		0	(14,103)	(14,103)	(14,103)
Total net assets/equity		42,310	(14,103)	(14,103)	(14,103)
Statement of financial position					
FX liability	(1,200,000)	(1,050,000)	(1,420,000)	(1,510,000)	(1,375,306)
CCIRS	0	(192,310)	260,346	282,979	166,190
IRS		0	(82,656)	(15,289)	(37,392)
Cash	1,200,000	1,163,534	1,147,545	1,094,562	1,089,076
Net assets	0	(78,776)	(94,765)	(147,748)	(157,433)
Net assets/equity	0	42,310	28,207	14,103	0
Accumulated surplus or deficit	0	36,466	66,558	133,645	157,433
Total net assets/equity	0	78,776	94,765	147,748	157,433

IE147. The total interest expense in surplus or deficit reflects State Government C's interest expense that results from its risk management strategy:

(a) In Period 1 the risk management strategy results in interest expense reflecting fixed interest rates in LC after taking into account the effect of the cross-currency interest rate swap.

(b) For Periods 2 to 4, after taking into account the effect of the interest rate swap entered into at the end of Period 1, the risk management strategy results in interest expense that changes with variable interest rates in LC (i.e., the variable interest rate prevailing in each period). However, the amount of the total interest expense is not equal to the amount of the variable rate interest because of the amortization of the amount that was in the cash flow hedge reserve for the first level relationship at the end of Period 1.[44]

Foreign Operations (Appendix B)

IE148. This example illustrates the application of paragraphs B12, B13, B14 and B15 of Appendix B in connection with the reclassification adjustment on the disposal of a foreign operation.

Example 19—Disposal of a Foreign Operation

Background

IE149. This example assumes the economic entity structure set out in paragraph B16 and that Controlling Entity D used a USD borrowing in Controlled Entity A to hedge the EUR/USD risk of the net investment in Controlled Entity C in Controlling Entity D's consolidated financial statements. Controlling Entity D uses the step-by-step method of consolidation. Assume the hedge was fully effective and the full USD/EUR accumulated change in the value of the hedging instrument before disposal of Controlled Entity C is €24 million (gain). This is matched exactly by the fall in value of the net investment in Controlled Entity C, when measured against the functional currency of Controlling Entity D (euro).

IE150. If the direct method of consolidation is used, the fall in the value of Controlling Entity D's net investment in Controlled Entity C of €24 million would be reflected totally in the foreign currency translation reserve relating to Controlled Entity C in Controlling Entity D's consolidated financial statements. However, because Controlling Entity D uses the step-by-step method, this fall in the net investment value in Controlled Entity C of €24 million would be reflected both in Controlled Entity B's foreign currency translation reserve relating to Controlled Entity C and in Controlling Entity D's foreign currency translation reserve relating to Controlled Entity B.

IE151. The aggregate amount recognized in the foreign currency translation reserve in respect of Controlled Entities B and C is not affected by the consolidation method. Assume that using the direct method of consolidation, the foreign currency translation reserves for Controlled Entities B and C in Controlling Entity D's consolidated financial statements are €62 million gain and €24 million loss respectively; using the step-by-step method of consolidation those amounts are €49 million gain and €11 million loss respectively.

Reclassification

IE152. When the investment in Controlled Entity C is disposed of, IPSAS 41 requires the full €24 million gain on the hedging instrument to be reclassified in surplus or deficit. Using the step-by-step method, the amount to be reclassified to surplus or deficit in respect of the net investment in Controlled Entity C would be only €11 million loss. Controlling Entity D could adjust the foreign currency translation reserves of both Controlled Entities B and C by €13 million in order to match the amounts reclassified in respect of the hedging instrument and the net investment as would have been the case if the direct method of consolidation had been used, if that was its accounting policy. An entity that had not hedged its net investment could make the same reclassification.

[44] See paragraph IE143(b). That amortization becomes an expense that has an effect like a spread on the variable interest rate.

Concessionary Loans (Paragraphs AG118–AG126)

Example 20—Receipt of a Concessionary Loan (Interest Concession)

IE153. A local authority receives loan funding to the value of CU5 million from an international development agency to build primary healthcare clinics over a period of 5 years. The agreement stipulates that the loan is to be repaid over the 5 year period as follows:

Year 1: no principal repayments

Year 2: 10 percent of the principal

Year 3: 20 percent of the principal

Year 4: 30 percent of the principal

Year 5: 40 percent of the principal

Interest is paid annually in arrears, at a rate of 5 percent per annum on the outstanding balance of the loan. A market-related rate of interest for a similar transaction is 10 percent.

IE154. The local authority has received a concessionary loan of CU5 million, which will be repaid at 5 percent below the current market interest rate. The difference between the proceeds of the loan and the present value of the contractual payments in terms of the loan agreement, discounted using the market-related rate of interest, is recognized in accordance with IPSAS 47, *Revenue*.

IE155. The journal entries to account for the concessionary loan are as follows:

1. On initial recognition, the entity recognizes the following:

Dr		Bank	5,000,000	
	Cr	Loan (refer to Table 2 below)		4,215,450
	Cr	Liability or revenue		784,550

Recognition of the receipt of the loan at fair value

IPSAS 47 is considered in recognizing either a liability or revenue for the off-market portion of the loan. Paragraph IE302 of that Standard provides journal entries for the recognition and measurement of the off-market portion of the loan deemed to be revenue.

2. Year 1: The entity recognizes the following:

Dr		Interest (refer to Table 3 below)	421,545	
	Cr	Loan		421,545

Recognition of interest using the effective interest method (CU4,215,450 × 10 percent)

Dr		Loan (refer to Table 1 below)	250,000	
	Cr	Bank		250,000

Recognition of interest paid on outstanding balance (CU5m × 5 percent)

3. Year 2: The entity recognizes the following:

Dr		Interest	438,700	

	Cr	Loan		438,700

Recognition of interest using the effective interest method (CU4,386,995 × 10 percent)

Dr		Loan	750,000	
	Cr	Bank		750,000

Recognition of interest and principal paid on outstanding balance (CU5m × 5 percent + CU500,000)

4. Year 3: The entity recognizes the following:

Dr		Interest	407,569	
	Cr	Loan		407,569

Recognition of interest using the effective interest method (CU4,075,695 × 10 percent)

Dr		Loan	1,225,000	
	Cr	Bank		1,225,000

Recognition of interest and principal paid on outstanding balance (CU4.5m × 5 percent + CU1m)

5. Year 4: The entity recognizes the following:

Dr		Interest	325,827	
	Cr	Loan		325,827

Recognition of interest using the effective interest method (CU 3,258,264 × 10 percent)

Dr		Loan	1,675,000	
	Cr	Bank		1,675,000

Recognition of interest and principal paid on outstanding balance (CU3.5m × 5 percent + CU1.5m)

6. Year 5: The entity recognizes the following:

Dr		Interest	190,909	
	Cr	Loan		190,909

Recognition of interest using the effective interest method (CU1,909,091 × 10 percent)

Dr		Loan	2,100,000	
	Cr	Bank		2,100,000

Recognition of interest and principal paid on outstanding balance (CU2m × 5 percent + CU2m)

Calculations:

Table 1: Amortization Schedule (Using Contractual Repayments at 5 percent Interest)

	Year 0 CU	Year 1 CU	Year 2 CU	Year 3 CU	Year 4 CU	Year 5 CU
Principal	5,000,000	5,000,000	5,000,000	4,500,000	3,500,000	2,000,000
Interest	–	250,000	250,000	225,000	175,000	100,000
Payments	–	(250,000)	(750,000)	(1,225,000)	(1,675,000)	(2,100,000)
Balance	**5,000,000**	**5,000,000**	**4,500,000**	**3,500,000**	**2,000,000**	–

Table 2: Discounting Contractual Cash Flows (Based on a Market Rate of 10 percent)

	Year 1 CU	Year 2 CU	Year 3 CU	Year 4 CU	Year 5 CU
Principal balance	5,000,000	4,500,000	3,500,000	2,000,000	–
Interest payable	250,000	250,000	225,000	175,000	100,000
Total payments (principal and interest)	250,000	750,000	1,225,000	1,675,000	2,100,000
Present value of payments	227,272	619,835	920,360	1,144,048	1,303,935
Total present value of payments					4,215,450
Proceeds received					5,000,000
Less: Present value of outflows (fair value of loan on initial recognition)					4,215,450
Off-market portion of loan to be recognized as non-exchange revenue					784,550

Table 3: Calculation of Loan Balance and Interest Using the Effective Interest Method

	Year 1 CU	Year 2 CU	Year 3 CU	Year 4 CU	Year 5 CU
Principal	4,215,450	4,386,995	4,075,695	3,258,264	1,909,091
Interest accrual	421,545	438,700	407,569	325,827	190,909
Interest payments	(250,000)	(250,000)	(225,000)	(175,000)	(100,000)
Principal payments	–	(500,000)	(1,000,000)	(1,500,000)	(2,000,000)
Balance	4,386,995	4,075,695	3,258,264	1,909,091	–

Example 21—Payment of a Concessionary Loan (Principal Concession)[45]

IE156. The department of education makes low interest loans available to qualifying students with delayed repayment terms as a means of promoting post-secondary education.

IE157. The department advanced CU250 million to various students at the beginning of the financial year, with the following terms and conditions:

Principal to be repaid as follows:

Year 1 to 3: no principal repayments

Year 2: 30 percent principal to be repaid

Year 3: 30 percent principal to be repaid

Year 4: 30 percent principal to be repaid

The remaining principal balance (10 percent of CU250 million) outstanding at the end of year 6 is to be forgiven.

Interest is calculated at 11.5 percent interest on the outstanding loan balance, and is to be paid annually in arrears. Assume the market rate of interest for a similar loan is 11.5 percent.

Scenario 1: Amortized Cost

IE158. After assessing the substance of the concessionary loan, the department of education classifies the financial asset in accordance with paragraphs 39–44. Based on the facts in the example, the department of education classifies the financial assets as measured at amortized cost.

IE159. The aggregated journal entries to account for the concessionary loans when measured at amortized cost are as follows:

1. On initial recognition, the entity recognizes the following:

Dr	Loan		236,989,595	
Dr	Expense		13,010,405	
Cr	Bank			250,000,000

Recognition of the advance of the loans at fair value

Paragraph AG125(b) is considered in recognizing an expense for the off-market portion of the loan deemed to be a non-exchange expense.

2. Year 1: The entity recognizes the following

Dr	Loan		27,253,803	
Cr	Interest revenue			27,253,803

Interest accrual using the effective interest method (CU236,989,595 × 11.5 percent)

[45] For simplicity, this example excludes any considerations in relation to calculating expected credit losses.

Dr	Bank		28,750,000	
Cr	Loan			28,750,000

Interest payment of CU250m × 11.5 percent

3. Year 2: The entity recognizes the following:

Dr	Loan		27,081,741	
Cr	Interest revenue			27,081,741

Interest accrual using the effective interest method (CU235,493,398 × 11.5 percent)

Dr	Bank		28,750,000	
Cr	Loan			28,750,000

Interest payment of CU250m × 11.5 percent

4. Year 3: The entity recognizes the following:

Dr	Loan		26,889,891	
Cr	Interest revenue			26,889,891

Interest accrual using the effective interest method (CU233,825,139 × 11.5 percent)

Dr	Bank		28,750,000	
Cr	Loan			28,750,000

Interest payment of (CU250m × 11.5 percent)

5. Year 4: The entity recognizes the following:

Dr	Loan		26,675,979	
Cr	Interest revenue			26,675,979

Interest accrual using the effective interest method (CU231,965,030 × 11.5 percent)

Dr	Bank		103,750,000	
Cr	Loan			103,750,000

Recognition of interest and principal received on outstanding balance (CU250m × 11.5 percent + CU75m)

6. Year 5: The entity recognizes the following:

Dr	Loan	17,812,466	
Cr	Interest revenue		17,812,466

Interest accrual using the effective interest method (CU154,891,009 × 11.5 percent)

Dr	Bank	95,125,000	
Cr	Loan		95,125,000

Recognition of interest and principal received on outstanding balance (CU175m × 11.5 percent + CU75m)

7. Year 6: The entity recognizes the following:

Dr	Loan	8,921,525	
Cr	Interest revenue		8,921,525

Interest accrual using the effective interest method (CU77,578,475 × 11.5 percent)

Dr	Bank	86,500,000	
Cr	Loan		86,500,000

Recognition of interest and principal received on outstanding balance (CU100m × 11.5 percent + CU75m)

Scenario 2: Fair Value through Surplus/Deficit

IE160. In addition to the terms outlined in paragraph 157, the loans provide the department of education the ability to call the instrument at any time for an amount that does not substantially reflect payment of outstanding principal and interest. After assessing the substance of the concessionary loans, the department of education determines the classification of the financial asset in accordance with paragraphs 39–44. Because the call feature in this example precludes the cash flows of this instrument from being solely payments of principal and interest, the department of education concludes the financial assets are classified at fair value through surplus/deficit.

IE161. The aggregated journal entries to account for the concessionary loans when classified at fair value through surplus/deficit are as follows:

1. On initial recognition, the entity recognizes the following:

Dr	Loan	236,989,595	
Dr	Expense	13,010,405	

Cr	Bank		250,000,000

Recognition of the advance of the loans at fair value

Paragraph AG125(b) is considered in recognizing an expense for the off-market portion of the loan deemed to be a non-exchange expense.

2. Year 1: The entity recognizes the following

Dr	Loan	27,253,803	
Cr	Interest revenue		27,253,803

Interest accrual of CU236,989,595 × 11.5 percent

Dr	Bank	28,750,000	
Cr	Loan		28,750,000

Interest payment of CU250m × 11.5 percent

3. Year 2: The entity recognizes the following:

Dr	Loan	27,081,741	
Cr	Interest revenue		27,081,741

Interest accrual of CU235,493,398 × 11.5 percent

Dr	Bank	28,750,000	
Cr	Loan		28,750,000

Interest payment of CU250m × 11.5 percent

Dr	Fair value adjustment	2,766,221	
Cr	Loan		2,766,221

Fair value adjustment (CU231,058,918[46] – (CU235,493,398 + CU27,081,741 – CU28,750,000))

4. Year 3: The entity recognizes the following:

Dr	Loan	26,571,776	
Cr	Interest revenue		26,571,776

[46] See table 4 in this example for reference to fair values.

Interest accrual of CU231,058,918 × 11.5 percent

Dr		Bank	28,750,000	
	Cr	Loan		28,750,000

Interest payment of CU250m × 11.5 percent

Dr		Fair value adjustment	2,620,867	
	Cr	Loan		2,620,867

Fair value adjustment (CU226,259,827 – (CU231,058,918 + CU26,571,776 – CU28,750,000))

5. Year 4: The entity recognizes the following:

Dr		Loan	26,019,880	
	Cr	Interest revenue		26,019,880

Interest accrual of CU226,259,827 × 11.5 percent

Dr		Bank	103,750,000	
	Cr	Loan		103,750,000

Interest payment of CU250m × 11.5 percent + CU75m principal repaid

Dr		Loan	1,472,217	
	Cr	Fair value adjustment		1,472,217

Fair value adjustment (CU150,001,924 – (CU226,259,827 + CU26,019,880 – CU103,750,000))

6. Year 5: The entity recognizes the following:

Dr		Loan	17,250,221	
	Cr	Interest revenue		17,250,221

Interest accrual of CU150,001,924 × 11.5 percent

Dr		Bank	95,125,000	
	Cr	Loan		95,125,000

Interest payment of CU175m × 11.5 percent + CU75m principal repaid

Dr		Loan	3,750,048	
	Cr	Fair value adjustment		3,750,048

Fair value adjustment (CU75,877,193 – (CU150,001,924 + CU17,250,221 – CU95,125,000))

7. Year 6: The entity recognizes the following:

Dr		Loan	8,725,877	
	Cr	Interest revenue		8,725,877

Interest accrual of CU75,877,193 × 11.5 percent

Dr		Bank	86,500,000	
	Cr	Loan		86,500,000

Interest payment of CU100m × 11.5 percent + CU75m principal repaid

Dr		Loan	1,896,930	
	Cr	Fair value adjustment		1,896,930

Fair value adjustment (CU0 – (CU75,877,193 + CU8,725,877 – CU86,500,000))

Calculations:

Table 1: Amortization Schedule (Using Contractual Repayments at 11.5 percent Interest)

	Year 0 CU'000	Year 1 CU'000	Year 2 CU'000	Year 3 CU'000	Year 4 CU'000	Year 5 CU'000	Year 6 CU'000

Example 22—Payment of a Concessionary Loan (Loan Commitment)

IE162. Prior to the beginning of every wheat agricultural season, the department of agriculture makes low-interest loans available to qualifying farmers as a means of promoting the cultivation of wheat within the jurisdiction. These loans are available on demand by individual farmers at any time during the planting season and must be repaid prior to the subsequent planting season.

IE163. The department makes available CU100 million to various farmers at the beginning of the harvest season in 20x1. By the end of the harvest season the department has distributed all CU100 million with the following terms and conditions:

- Principal is to be repaid prior to the next harvest season.

- No interest is charged on the outstanding loan balance. Assume the market rate of interest for similar loans is 1.5 percent.

At the origination of the loan commitments, there is no indication that the instruments are credit-impaired.

Scenario 1: No Expected Credit Losses Identified During the Loan Commitment Period

IE164. As the department of agriculture has committed to issue below-market-rate loans, the commitments are accounted for in accordance with paragraphs 45(d) and 57. The aggregated journal entries to initially account for the loan commitments are as follows:

1. On initial recognition, the entity recognizes the following:

Dr	Expense		1,477,833	
Cr	Loan commitment liability			1,477,833

Recognition of commitments to issue loans at below-market rates

The loan commitments are initially measured at fair value in accordance with paragraph 57.

IE165. No further entries are required during the commitment period. This is a result of the department of agriculture electing not to charge a commitment fee, resulting in no revenue to recognize associated with the loan commitments, and the department identifying no credit losses during the commitment period.

IE166. When the concessionary loans are granted, and the loan commitments are satisfied, the substance of the concessionary loans is assessed. The department of agriculture classifies the financial assets in accordance with paragraphs 39–44. Based on the facts in the example, the department of agriculture classifies the financial assets as measured at amortized cost.

IE167. The aggregated journal entries to account for the concessionary loans are as follows:

2. On initial recognition, the entity recognizes the following:

Dr	Loan		98,522,167	
Dr	Loan commitment liability		1,477,833	
Cr	Cash			100,000,000

Recognition of the advance of the loans at fair value

Paragraph AG125(b) is considered in recognizing an expense for the off-market portion of the loan deemed to be a non-exchange expense. However, as an expense was previously recognized as part of the loan commitment, no further expense is required.

3. Interest is recognized as follows:

Dr	Loan		1,477,833	
Cr	Interest revenue			1,477,833

Interest accrual using the effective interest method (CU98,522,167× 1.5 percent)

4. Loan repayments are recognized as follows:

Dr	Cash		100,000,000	
Cr	Loan			100,000,000

Department of agriculture collects principal repayments of CU100 million

Scenario 2: Evidence of Credit Impairment Identified During the Loan Commitment Period

IE168. As the department of agriculture has committed to issue below-market-rate loans, the commitments are accounted for in accordance with paragraphs 45(d) and 57. The aggregated journal entries to initially account for the loan commitments are as follows:

1. On initial recognition, the entity recognizes the following:

Dr	Expense	1,477,833		
Cr	Loan commitment liability			1,477,833

Recognition of commitments to issue loans at below-market rates

The loan commitments are initially measured at fair value in accordance with paragraph 57.

IE169. During the loan commitment period, the department of agriculture noted the yield from the current season's wheat harvest was expected to be lower than initially projected. Using the most recent information available, the department of agriculture makes the following estimates:

- The portfolio of loans has a lifetime probability of default of 5 percent; and
- The loss given default is 35 percent, and would occur when the principal is repaid.

2. The impairment is recognized as follows:

Dr	Impairment expense	1,724,137		
Dr	Loan commitment liability	1,477,833		
Cr	Loss allowance			3,201,970

Recognition of impairment expense of CU 1.724 million

The impairment expense is CU1.724 million, which is calculated by multiplying the amount of cash flows receivable (CU 100 million) by the probability of default (5 percent) and by the loss given default (35 percent), and discounting at the effective interest rate for one year (1.5 percent).

IE170. As the concessionary loans are provided, and the loan commitments are satisfied, the substance of the concessionary loans is assessed. The department of agriculture classifies the financial assets in accordance with paragraphs 39–44. Based on the facts in the example, the department of agriculture classifies the financial assets as measured at amortized cost.

IE171. The aggregated journal entries to account for the concessionary loans are as follows:

3. On initial recognition, the entity recognizes the following:

Dr	Loan	96,798,030		
Dr	Loss allowance	3,201,970		
Cr	Cash			100,000,000

Recognition of the advance of the loans at fair value

Paragraph AG125(b) is considered in recognizing an expense for the off-market portion of the concessionary originated credit-impaired loan. However, as an expense was previously recognized as part of the loan commitment, no further expense is required.

4. Interest is recognized as follows:

Dr	Loan	1,451,970	
Cr	Interest revenue		1,451,970

Interest accrual using the effective interest method (CU96,798,030 ×1.5 percent)

IE172. Prior to the loan maturing, the harvest was stronger than projected during the commitment period. Credit losses on the principal balance are expected to be CU 500,000.

5. The impairment gain is recognized as follows:

Dr	Loan	1,250,000	
Cr	Impairment gain		1,250,000

Recognition of the impairment gain of CU1.25 million

Reduction of CU1.25 million is required in order to recognize total expected credit losses of CU500,000 (CU99,500,000 – CU96,798,030 – CU1,451,970).

6. Loan repayments are recognized as follows:

Dr	Cash	99,500,000	
Cr	Loan		99,500,000

Department of agriculture collects principal repayments of CU99.5 million

Calculations:

Table 1: Amortization Schedule (Using Contractual Repayments at 1.5 Percent Interest)

	Year 0	**Year 1**

Financial Guarantee (Paragraphs AG131–AG136)

Example 23—Financial Guarantee Contract Provided at Nominal Consideration

IE173. Entity C is a major motor vehicle manufacturer in Jurisdiction A. On January 1, 20X1 Government A (the issuer) enters into a financial guarantee contract with Entity B (the holder) to reimburse Entity B against the financial effects of default by Entity C (the debtor) for a 5 year loan of 50 million Currency Units (CUs) repayable in two equal installments of CU25 million in 20X3 and 20X5. Entity C provides nominal consideration of CU5,000 to Government A. At initial recognition, Government A measures the financial guarantee contract at fair value. Applying a valuation technique, Government A determines the fair value of the financial guarantee contract to be CU5,000,000.

IE174. On December 31, 20X1, having reviewed the financial position and performance of Entity C and having evaluated forward looking information including expected automotive industry trends, Government A determines there has been no significant increase in credit risk since initial recognition. In applying the measurement requirements of paragraph 45(c), Government A measures the financial guarantee contract at the higher of:

(i) The amount of the loss allowance calculated in accordance with this standard; and

(ii) The amount initially recognized, less the cumulative amount of revenue recognized.

Government A measures the loss allowance at an amount equal to the 12 month expected credit losses. Government A calculates the amount of loss allowance to be less than the amount initially recognized. Government A therefore does not recognize an additional liability in its statement of financial position. Government A makes the disclosures relating to fair value and credit risk in IPSAS 30, *Financial Instruments*: *Disclosures* in respect of the financial guarantee contract. In its statement of financial performance

Government A recognizes revenue of CU1,000,000 in respect of the initial fair value of the instrument (total consideration of CU5,000,000 / 5 years).

IE175. In 20X2 there has been a downturn in the motor manufacturing sector affecting Entity C. Although it has met its obligations for interest payments, Entity C is seeking bankruptcy protection and is expected to default on its first repayment of principal. Negotiations are advanced with a potential acquirer (Entity D), which will restructure Entity C. Entity D has indicated that it will assume responsibility for the final installment of the loan with Entity B, but not the initial installment. Government A determines there has been a significant increase in credit risk since initial recognition of the financial guarantee contract and measures the loss allowance associated with the financial guarantee contract at an amount equal to the lifetime expected credit losses. Government A calculates the lifetime expected credit losses to be CU25.5 million and recognizes an expense for, and increases its liability by, CU22.5 million (after the sale to Entity D, the Government has an expected loss of 25 million CUs on the first installment and CU500,000 on the final installment, for a total liability of CU25.5 million. The current balance of the financial guarantee of CU3 million is required to be increased by CU22.5 million).

IE176. The journal entries at initial acquisition and at the reporting dates are as follows:

1. On initial recognition, the entity recognizes the following:

Dr		Bank	5,000	
Dr		Expense	4,995,000	
	Cr	Financial guarantee contract		5,000,000

2. Year 1: The entity recognizes the following

Dr		Financial guarantee contract	1,000,000	
	Cr	Revenue		1,000,000

Revenue of CU5,000,000 is recognized over a 5 year period

3. Year 2: The entity recognizes the following:

Dr		Financial guarantee contract	1,000,000	
	Cr	Revenue		1,000,000

Revenue of CU5,000,000 is recognized over a 5 year period

Dr		Expense	22,500,000	
	Cr	Financial guarantee contract		22,500,000

Lifetime expected credit losses of CU25.5 million less CU3,000,000 recognized as a liability

Fair Value Measurement Considerations (Paragraphs 66–68)

IE177. Illustrative examples 23–26 demonstrate different valuation techniques for valuing unquoted equity instruments. When selecting an appropriate valuation technique, professional judgment is exercised in considering the requirements in AG149–AG154.

Example 24—Valuation of Unquoted Equity Instruments (Transaction Price Paid for an Identical or Similar Instrument)

IE178. In 20X0, a Sovereign Wealth Fund bought ten equity shares of Entity D, a private company, representing ten per cent of the outstanding voting shares of Entity D, for CU1,000. The Sovereign Wealth Fund prepares annual financial statements and is required to measure the fair value of its non-controlling equity interest in Entity D as at December 31, 20X2 (i.e., the measurement date).

IE179. During December of 20X2, Entity D raised funds by issuing new equity capital (ten shares for CU1,200) to other investors. The Sovereign Wealth Fund concludes that the transaction price of the new equity capital issue for CU1,200 represents fair value at the date those shares were issued.

IE180. Both the Sovereign Wealth Fund and the other investors in Entity D have shares with the same rights and conditions. Between the new equity capital issue to other investors and the measurement date, there have been no significant external or internal changes in the environment in which Entity D operates. As a result, the Sovereign Wealth Fund concludes that CU1,200 is the amount that is most representative of the fair value of its non-controlling equity interest in Entity D at the measurement date.

Analysis

IE181. When an investor has recently made an investment in an instrument that is identical to the unquoted equity instrument being valued, the transaction price can be a reasonable starting point for measuring the fair value of the unquoted equity instrument at the measurement date, if that transaction price represented the fair value of the instrument at initial recognition. An investor must, however, use all information about the performance and operations of an investee that becomes reasonably available to the investor after the date of initial recognition up to the measurement date, because such information might have an effect on the fair value of the unquoted equity instrument of the investee at the measurement date.

Example 25—Valuation of Unquoted Equity Instruments (Discounted Cash Flow)

IE182. As part of an initiative to encourage the use of renewable energy, Government A has a five per cent non-controlling equity interest in Entity R, a private company developing highly efficient solar panels in Government A's jurisdiction. Government A derives Entity R's indicated fair value of equity by deducting the fair value of debt (in this case assumed to be CU240 million) from the enterprise value of CU1,121.8 million as shown in the table below. Government A has concluded that there are no relevant non-operating items that need to be adjusted from Entity R's expected free cash (FCF).

IE183. Entity R's value was computed by discounting the expected free cash flows (i.e., post-tax cash flows before interest expense and debt movements, using an unlevered tax rate) by an assumed weighted average cost of capital (WACC) of 8.9 per cent. The WACC computation included the following variables: cost of equity capital of 10.9 per cent, cost of debt capital of 5.7 percent, effective income tax rate of 30 per cent, debt to total capital ratio of 28.6 per cent and equity to total capital ratio of 71.4 per cent.

	Year 0 CU'000	Year 1 CU'000	Year 2 CU'000	Year 3 CU'000	Year 4 CU'000	Year 5 CU'000
FCF[47]		-	100	100	100	100
Terminal value[48]						1,121.8
DCF Method using enterprise value less fair value of debt						
Discount factors[49]		0.9182	0.8430	0.7740	0.7107	0.6525
Present value of FCF and terminal value[50]		91.8	84.3	77.4	71.1	797.2
Enterprise value	1,121.8					
Less fair value of debt	(240.0)					
Indicated fair value of equity	**881.8**					

IE184. This example assumes that all unquoted equity instruments of Entity R have the same features and give the holders the same rights. However, Government A considers that the indicated fair value of equity obtained above (CU881.8 million) must be further adjusted to consider:

- A non-controlling interest discount because Government A's interest in Entity R is a non-controlling equity interest and Government A has concluded that there is a benefit associated with control. For the purposes of this example, it has been assumed that the non-controlling interest discount is CU8.00 million;[51] and
- A discount for the lack of liquidity, because Government A's interest in Entity R is unquoted. For the purposes of this example, it has been assumed that the discount for the lack of liquidity amounts to CU4.09 million.

IE185. As a result, Government A concludes that CU32 million is the price that is most representative of the fair value of its five per cent non-controlling equity interest in Entity R at the measurement date, as shown below:

47 FCF represent cash flows before interest expense and debt movements. The tax charge has been computed considering no deduction for interest expense.

48 The terminal value has been computed assuming the yearly cash flows amounting to CU100 million would grow in perpetuity at a rate of zero (i.e., assuming that the impact of inflation on future cash flows is expected to be offset by market shrinkage).

49 The discount factors have been computed using the formula: 1/(1 + WACC) ^ year. This formula, however, implies that the cash flows are expected to be received at the end of each period. Sometimes it might be more appropriate to assume that cash flows are received more or less evenly throughout the year (mid-year discounting convention). Using the mid-year discounting convention, the discount factor for year 'n' would have been computed as follows: 1/(1 + WACC) ^ (n – 0.5).

50 The present value amounts have been computed by multiplying the FCF and terminal value by the corresponding discount factors.

51 The process shown above is not the only possible method that a public sector entity could apply to measure the fair value of its non-controlling equity interest. As a result, the adjustments above should not be considered to be a comprehensive list of all applicable adjustments. The necessary adjustments will depend on the specific facts and circumstances. In addition, the amounts of the adjustments above are not supported by detailed calculations. They have been included for illustrative purposes only.

	CU'000
Indicated fair value of equity × 5 percent	
(i.e., CU881.8 × 5 percent)	44.09
Non-controlling interest discount	(8.00)
Discount for lack of liquidity	(4.09)
Fair value of 5 percent non-controlling equity interest	**32.00**

Example 26—Valuation of Unquoted Equity Instruments (Constant Growth with Limited Information)

IE186. Entity S is a private company. Public Investment Fund T has a ten per cent non-controlling equity interest in Entity S. Entity S's management has prepared a two-year budget. However, Entity S's management shared with the manager of Public Pension Plan T materials from its annual Board meetings, at which management discussed the assumptions to back up the expected growth plan for the next five years.

IE187. On the basis of the information obtained from the Board meeting, Public Investment Fund T has extrapolated the two-year budget by reference to the basic growth assumptions discussed in the Board meeting and has performed a discounted cash flow calculation.

IE188. On the basis of Entity S's management's two-year detailed budget, sales and EBIT would reach CU200 and CU50, respectively, in 20X3. Public Investment Fund T understands that Entity S's management expects sales to achieve further growth of five per cent per annum until 20X8 with the same EBIT margin (as a percentage of sales) as in 20X3. Consequently, Public Investment Fund T projects the EBIT of Entity S as follows:[52]

	Year 1 CU'000	Year 2 CU'000	Year 3 CU'000	Year 4 CU'000	Year 5 CU'000	Year 6 CU'000	Year 7 CU'000
Sales	150	200	210	221	232	243	255
EBIT margin	23%	25%	25%	25%	25%	25%	25%
EBIT	**35**	**50**	**53**	**55**	**58**	**61**	**64**

IE189. Public Investment Fund T is also aware that the management of Entity S expects the entity to reach a stable growth stage by 20X8. To calculate the terminal value, using the constant growth discount model, Public Investment Fund T assumes a long-term terminal growth rate of two per cent on the basis of the long-term outlook of Entity S, its industry and the economy in the country where Entity S operates. If Entity S has not reached the stable growth stage by the end of the projection period, Public Investment Fund T would need to extend the projection period until the stable growth stage is reached and calculate the terminal value at that point.[53]

[52] To derive Entity S's FCF for use in the discounted cash flow method, Public Investment Fund T used Entity S's two-year budget and its understanding of the investee's asset and capital structures, reinvestment requirements and working capital needs.

[53] This example illustrates a two-stage model in which the first stage is delineated by a finite number of periods (20X2–20X8) and after this first stage the example assumes a period of constant growth for which Public Investment Fund T calculates a terminal value for Entity S. In other cases an investor might conclude that a multiple-stage model rather than a two-stage model would be more appropriate. A multiple-stage model would generally have a period after the discrete projection period in which growth might be phased down over a number of years before the constant growth period for which a terminal value can be estimated.

IE190. Finally, Public Investment Fund T cross-checks this valuation by comparing Entity S's implied multiples to those of its comparable company peers.[54]

Example 27—Valuation of Unquoted Equity Instruments (Adjusted Net Assets)

IE191. State Government A has a ten per cent non-controlling equity interest in Entity V, a private company. There is no controlling shareholder for Entity V, which is a payroll services provider for its investors, including State Government A. Entity V's transactions, and therefore service fees, depend on the total number of employees of its investors (which are all the State Governments of Jurisdiction Z) and, as a result, Entity V does not have its own growth strategy. Entity V has a very low profit margin and it does not have comparable public company peers.

IE192. State Government A needs to measure the fair value of its non-controlling equity interest in Entity V as of December 31, 20X1 (i.e., the measurement date). State Government A has Entity V's latest statement of financial position, which is dated September 30, 20X1.

IE193. The following are the adjustments performed by State Government A to the latest statement of financial position of Entity V:

- Entity V's major asset is an office building that was acquired when Entity V was founded 25 years ago. The fair value of the building was measured by a valuation specialist at CU2,500 at the measurement date. This value compares to a book value of CU1,000.
- During the three-month period from September 30, 20X1 to the measurement date, the fair value of Entity V's investments in public companies changed from CU500 to CU600.
- State Government A observes that Entity V measures its current assets and current liabilities at fair value. The volume of operations of Entity V is so flat that the investor estimates that the amounts of the current assets and current liabilities shown in Entity V's statement of financial position as of September 30, 20X1 are most representative of their fair value at the measurement date, with the exception of an amount of CU50 included in Entity V's trade receivables that became unrecoverable after September 30, 20X1.
- On the basis of Entity V's management model and profitability, State Government A estimates that unrecognized intangible assets would not be material.
- State Government A does not expect that Entity V's cash flows for the quarter ended December 31, 20X1 are material.
- State Government A does not expect any major sales of assets from Entity V. As a result, it concludes that there are no material tax adjustments that need to be considered when valuing Entity V.

Entity V – Statement of financial position (CU)

	Sept 30, 20X1	Adjustments	Estimated Dec 31, 20x1
ASSETS			
Non-current assets			
Property, plant and equipment	2,000	1,500	3,500

[54] This example assumes that the fair value conclusion would have included any necessary adjustments (for example, non-controlling interest discount, discount for the lack of liquidity etc.) that market participants would incorporate when pricing the equity instruments at the measurement date.

Entity V – Statement of financial position (CU)

	Sept 30, 20X1	Adjustments	Estimated Dec 31, 20x1
Investments in equity instruments	500	100	600
	2,500	1,600	4,100
Current assets			
Trade receivables	500	(50)	450
Cash and cash equivalents	500	-	500
	1,000	(50)	950
Total Assets	**3,500**	**1,550**	**5,050**
NET ASSETS/EQUITY AND LIABILITIES			
Total net assets/equity	2,500	1,550	4,050
Current liabilities	1,000	0	1,000
Total net assets/equity and liabilities	**3,500**	**1,550**	**5,050**

IE194. Before considering any adjustments (for example, discount for the lack of liquidity, non-controlling interest discount), the indicated fair value of State Government A's ten per cent non-controlling equity interest in Entity V is CU405 (10 percent × CU4,050 = CU405). For the purpose of this example, it has been assumed that the discount for the lack of liquidity amounts to CU40 and that the non-controlling interest discount amounts to CU80.

IE195. On the basis of the facts and circumstances described above, State Government A concludes that the price that is most representative of fair value for its ten per cent non-controlling equity interest in Entity V is CU285 at the measurement date (CU405 – (CU40 – CU85 = CU285).[55]

Example 28—Valuation of Unquoted Equity Instruments with Non-Exchange Component

IE196. National Government A purchased 1,000 shares of International Investment Bank B on 1 July 20X6 for CU5,000, or CU5 per share. Because National Government A is a non-controlling shareholder, it does not receive the Bank's budgets or cash flow forecasts. National Government A prepares annual financial statements and is measuring the fair value of its non-controlling equity interest in the International Investment Bank on December 31, 20X6 (i.e., the measurement date).

IE197. The amount paid for the unquoted equity instruments (CU5,000) in July 20X6 is a reasonable starting point for measuring the fair value of the investor's non-controlling equity interest in International Investment Bank B at the measurement date. However, National Government A is required to assess whether the amount paid needs to be adjusted if there is evidence that other factors exist or if other evidence indicates that the

[55] The process shown above is not the only possible method that a public sector entity could apply to measure the fair value of its non-controlling equity interest. As a result, the adjustments above should not be considered to be a comprehensive list of all applicable adjustments. The necessary adjustments will depend on the specific facts and circumstances. In addition, the amounts of the adjustments above are not supported by detailed calculations. They have been included for illustrative purposes only.

transaction price is not representative of fair value at the measurement date. For example, in some circumstances a public sector entity may transfer consideration in excess of the fair value of the shares acquired, to provide a subsidy to the recipient. In these circumstances, National Government A adjusts the transaction price accordingly and recognizes an expense for the concessionary portion of the consideration because the transaction includes a payment for the equity instrument and subsidy.

Example 29—Valuation of Unquoted Equity Instruments Arising from a Non-Exchange Transaction

IE198. On January 1, 20X1, National Government A transfers CU1000 to International Development Bank B. In exchange, Bank B issues 100 common shares with a par value of CU8. In transferring the CU1000, National Government A granted a concession of CU200, as evidenced in the transaction documentation.

IE199. When accounting for the transaction, National Government A identifies two components embedded in the transfer of CU1000. The first component is a non-exchange expense of CU200. National Government A applies the guidance in paragraphs AG128–AG130 when accounting for this component.

IE200. The second component is the 100 common shares in Bank B. IPSAS 41 requires, at initial recognition, financial instruments be measured at fair value plus or minus, in the case of a financial asset or financial liability not at fair value through surplus or deficit, directly attributable transaction costs.

IE201. As the best evidence of fair value at initial recognition is normally the transaction price, National Government A determines the transaction price of CU800, as evidenced in the transaction document (100 common shares x par value of CU8/share), is the appropriate value at initial recognition.

IE202. In addition to the transaction documentation, National Government concludes CU8 per share is the fair value of each share based on other similar transactions Bank B had with other national governments. In each transaction, Bank B issued common shares for CU8.

Example 30—Valuation of Debt Obligations: Quoted Price

IE203. On January 1, 20X1, State Government B issues at par a CU2 million BBB-rated exchange-traded five-year fixed rate debt instrument with an annual 10 per cent coupon. State Government B designated this financial liability as at fair value through surplus or deficit.

IE204. On December 31, 20X1, the instrument is trading as an asset in an active market at CU929 per CU1,000 of par value after payment of accrued interest. State Government B uses the quoted price of the asset in an active market as its initial input into the fair value measurement of its liability (CU929 × [CU2 million ÷ CU1,000] = CU1,858,000).

IE205. In determining whether the quoted price of the asset in an active market represents the fair value of the liability, State Government B evaluates whether the quoted price of the asset includes the effect of factors not applicable to the fair value measurement of a liability. State Government B determines that no adjustments are required to the quoted price of the asset. Accordingly, State Government B concludes that the fair value of its debt instrument at December 31, 20X1, is CU1,858,000. State Government B categorizes and discloses the fair value measurement of its debt instrument within Level 1 of the fair value hierarchy in accordance with IPSAS 30, *Financial Instruments: Disclosures*.

Example 31—Valuation of Debt Obligations: Present Value Technique

IE206. On January 1, 20X1, National Government C issues at par in a private placement a CU2 million BBB-rated five-year fixed rate debt instrument with an annual 10 per cent coupon. National Government C designated this financial liability as at fair value through surplus or deficit.

IE207. At December 31, 20X1, National Government C still carries a BBB credit rating. Market conditions, including available interest rates, credit spreads for a BBB-quality credit rating and liquidity, remain unchanged from

the date the debt instrument was issued. However, National Government C's credit spread has deteriorated by 50 basis points because of a change in its risk of non-performance. After taking into account all market conditions, National Government C concludes that if it was to issue the instrument at the measurement date, the instrument would bear a rate of interest of 10.5 per cent or National Government C would receive less than par in proceeds from the issue of the instrument.

IE208. For the purpose of this example, the fair value of National Government C's liability is calculated using a present value technique. National Government C concludes that a market participant would use all the following inputs when estimating the price the market participant would expect to receive to assume National Government C's obligation:

(a) the terms of the debt instrument, including all the following:

(i) coupon of 10 percent;

(ii) principal amount of CU2 million; and

(iii) term of four years.

(b) the market rate of interest of 10.5 per cent (which includes a change of 50 basis points in the risk of non-performance from the date of issue).

IE209. On the basis of its present value technique, National Government C concludes that the fair value of its liability at December 31, 20X1 is CU1,968,641.

IE210. Entity C does not include any additional input into its present value technique for risk or profit that a market participant might require for compensation for assuming the liability. Because National Government C's obligation is a financial liability, National Government C concludes that the interest rate already captures the risk or profit that a market participant would require as compensation for assuming the liability. Furthermore, National Government C does not adjust its present value technique for the existence of a restriction preventing it from transferring the liability.

Classification of Financial Assets (Paragraphs 39–44)

Example 32—Capital Subscriptions Held with Redemption Features

IE211. In order to participate in and support the activities of International Development Bank A, or similar international organization, Federal Government B invested and acquired a fixed number of subscription rights in International Development Bank A, based on Federal Government B's proportional share of global Gross Domestic Product. Each subscription right costs CU1,000, which provides Federal Government B with the right to put the subscription rights back to International Development Bank A in exchange for the initial amount invested (i.e., CU1,000 per subscription right). International Development Bank A has no obligation to deliver dividends on the subscription rights.

IE212. Government B is evaluating the appropriate classification of the financial asset based on the terms of the subscription rights.

IE213. In determining the classification of the financial asset, Government B concludes the subscription rights do not meet the definition of an equity instrument as defined in IPSAS 28, *Financial Instruments: Presentation*.[56] As a result, Government B concludes the election available in paragraph 43 to measure an equity instrument at fair value through net assets/equity is not available.

[56] Based on guidance in paragraphs 15, 16, 17 and 18 of IPSAS 28 it is possible the puttable subscription rights meet the requirements to be classified as an equity instrument from the Bank's perspective. However, instruments meeting the provisions of paragraphs 15, 16, 17 and 18 of IPSAS 28 do not meet the definition of an equity instrument in IPSAS 28.

IE214. Furthermore, as the contractual terms of the subscription rights fail to give rise on specified dates to cash flows solely for payments of principal and interest, the subscription rights cannot be classified as a debt instrument measured at amortized cost or fair value through net assets/equity. Government B concludes puttable subscription rights are required to be classified at fair value through surplus or deficit.

Effective Interest Method (Paragraphs 69–70)

Example 33—Measuring the Effective Interest Rate of a Bond Issued at a Discount with Transaction Costs

IE215. State Government A issues a 5-year bond with a face value of CU500,000. The instrument carries a fixed yield of 4 percent, with interest payments paid annually. The bond was issued at a discount of 2 percent and State Government A was required to pay the bond underwriters a fee equal to CU12,000 on the transaction date.

IE216. In determining the amortized cost of the instrument, State Government A must calculate the effective interest rate. The effective interest rate is the rate that exactly discounts estimated future cash payments through the expected life of the instrument to the gross carrying amount of the instrument.

IE217. Assuming there are no expectations of prepayment, extension or other call options, the estimated future cash flows are CU20,000 per annum in interest payments (CU20,000 = CU500,000 × 4 percent), with an additional CU500,000 principal payment made at maturity.

IE218. The gross carrying amount of the bond on the transaction date is calculated based on the net proceeds received by State Government A. Since the bond was issued at a discount, before transaction costs, State Government A received CU490,000 (CU500,000 × (100 percent – 2 percent)). Taking transaction costs into account, the next proceeds on issue were CU478,000 (CU490,000 – CU12,000).

Year	**(a)**	**(b)**	**(c)**	**(d = a – b – c)**
	Cash inflows	**Cash outflows (transaction costs and interest)**	**Cash outflows (principal)**	**Net cash flows**
Year 1 (beginning)	500,000	12,000	10,000	478,000
Year 1 (end)	-	20,000	-	(20,000)
Year 2	-	20,000	-	(20,000)
Year 3	-	20,000	-	(20,000)
Year 4	-	20,000	-	(20,000)
Year 5	-	20,000	500,000	(520,000)

IE219. The effective interest rate of the bond is calculated by determining the rate that exactly discounts the estimated cash flows of CU20,000 per annum, plus the principal repayment at maturity, to the gross amount of CU478,000. Essentially, the effective interest rate determines the rate of interest incurred based on the net proceeds received by State Government A.

IE220. In this example, the effective interest rate is 5.02 percent. This is appropriate as the bond yield was stated to be 4 percent on a principal amount of CU500,000. However, in substance, State Government A only receives CU478,000 and continues to make annual interest payments of CU20,000. As such, as the transaction costs and discount increase, the more the effective interest rate will diverge from the contractual rate.

Effective interest rate = 5.02				
Year	**(a)**	**(b)**	**(c)**	**(d = a + b – c)**
	Opening balance	**Interest expense**	**Interest/principal payment**	**Ending balance**
Year 1	478,000	23,980	20,000	481,980
Year 2	481,980	24,180	20,000	486,160
Year 3	486,160	24,389	20,000	490,549
Year 4	490,549	24,610	20,000	495,159
Year 5	495,159	24,841	520,000	-

Implementation Guidance

This guidance accompanies, but is not part of, IPSAS 41.

Section A Scope

A.1 Practice of Settling Net: Forward Contract to Purchase a Commodity

Entity XYZ enters into a fixed price forward contract to purchase one million barrels of oil in accordance with its expected usage requirements. The contract permits XYZ to take physical delivery of the oil at the end of twelve months or to pay or receive a net settlement in cash, based on the change in fair value of oil. Is the contract accounted for as a derivative?

While such a contract meets the definition of a derivative, it is not necessarily accounted for as a derivative. The contract is a derivative instrument because there is no initial net investment, the contract is based on the price of oil and it is to be settled at a future date. However, if XYZ intends to settle the contract by taking delivery and has no history for similar contracts of settling net in cash or of taking delivery of the oil and selling it within a short period after delivery for the purpose of generating a profit from short-term fluctuations in price or dealer's margin, the contract is not accounted for as a derivative under IPSAS 41. Instead, it is accounted for as an executory contract (unless the entity irrevocably designates it as measured at fair value through surplus or deficit in accordance with paragraph 6 of IPSAS 41).

A.2 Option to Put a Non-Financial Asset

Entity XYZ owns an office building. XYZ enters into a put option with an investor that permits XYZ to put the building to the investor for CU150 million. The current value of the building is CU175 million.[57] The option expires in five years. The option, if exercised, may be settled through physical delivery or net cash, at XYZ's option. How do both XYZ and the investor account for the option?

XYZ's accounting depends on XYZ's intention and past practice for settlement. Although the contract meets the definition of a derivative, XYZ does not account for it as a derivative if XYZ intends to settle the contract by delivering the building if XYZ exercises its option and there is no past practice of settling net (paragraph 5 of IPSAS 41; but see also paragraph 6 of IPSAS 41).

The investor, however, cannot conclude that the option was entered into to meet the investor's expected purchase, sale or usage requirements because the investor does not have the ability to require delivery (IPSAS 41, paragraph 8). In addition, the option may be settled net in cash. Therefore, the investor has to account for the contract as a derivative. Regardless of past practices, the investor's intention does not affect whether settlement is by delivery or in cash. The investor has written an option, and a written option in which the holder has a choice of physical settlement or net cash settlement can never satisfy the normal delivery requirement for the exemption from IPSAS 41 because the option writer does not have the ability to require delivery.

However, if the contract were a forward contract instead of an option, and if the contract required physical delivery and the reporting entity had no past practice of settling net in cash or of taking delivery of the building and selling it within a short period after delivery for the purpose of generating a profit from short-term fluctuations in price or dealer's margin, the contract would not be accounted for as a derivative. (But see also paragraph 6 of IPSAS 41).

[57] In this guidance, monetary amounts are denominated in 'currency units' (CU).

Section B Definitions

Section B provides non-authoritative guidance on whether certain items meet the definitions in IPSAS 41.

B.1 Definition of a Financial Instrument: Gold Bullion

Is gold bullion a financial instrument (like cash) or is it a commodity?

It is a commodity. Although bullion is highly liquid, there is no contractual right to receive cash or another financial asset inherent in bullion.

B.1.1 Definition of a Financial Instrument: Monetary Gold

Is monetary gold a financial instrument (like cash)?

No. Similar to gold bullion, monetary gold is not a financial instrument as there is no contractual right to receive cash or another financial asset inherent in the item. However, given that monetary gold shares several characteristics with a financial asset, applying the principles set out in IPSAS 41 is generally appropriate under the hierarchy set out in paragraphs 9–15 of IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*. It may however be appropriate for an entity to consider other IPSAS depending on the facts and circumstances related to its holding of monetary gold.

B.1.2 Public Sector Specific Financial Instruments

B.1.2.1 Definition of a Financial Instrument: Currency Issued as Legal Tender

Does issuing currency as legal tender create a financial liability for the issuer?

It depends. Currency derives its value, in part, through the statutory arrangement established between the issuer and the holder of the currency whereby currency is accepted as a medium of exchange and is recognized legally as a valid form of payment. In some jurisdictions, this statutory arrangement further obligates the issuer to exchange currency when it is presented by holders and may explicitly indicate that currency is a charge on government assets.

For the purposes of this Standard, an entity considers the substance rather than the legal form of an arrangement in determining whether there is a contractual obligation to deliver cash. Contracts are evidenced by the following:

- Willing parties entering into an arrangement;
- The terms of the contract create rights and obligations for the parties to the contract; and
- The remedy for non-performance is enforceable by law.

When laws and regulations or similar requirements enforceable by law, such as a Banking Act, set out the requirements and responsibilities of an entity to exchange outstanding currency, a “contract” exists for the purposes of this Standard. A financial liability is created when an entity issues currency to the counterparty as, at this point, two willing parties have agreed to the terms of the arrangement. Where no financial liability exists, an entity should consider whether an obligation is created in accordance with paragraphs 22–43 of IPSAS 19, *Provisions, Contingent Liabilities and Contingent Assets*. Prior to currency being issued, there is no transaction between willing parties. Unissued currency does not meet the definition of a financial instrument. An entity applies paragraph 13 of IPSAS 12, Inventories, in accounting for any unissued currency.

B.1.2.2 Definition of a Financial Instrument: Special Drawing Rights (SDR) Holdings

Do Special Drawing Rights (SDR) Holdings meet the definition of a financial asset?

Yes. SDR holdings represent a claim on the currencies of members of the International Monetary Fund (IMF). SDR’s can be used in transactions with the IMF or can be exchanged between participants of the IMF’s SDR Department.

Liquidity is guaranteed by a mechanism requiring participants to deliver cash in exchange for SDRs. Accordingly, SDR holdings are regarded as a financial asset.

B.1.2.3 Definition of a Financial Instrument: Special Drawing Rights (SDR) Allocations

Do Special Drawing Rights (SDR) Allocations meet the definition of a financial liability?

Yes. SDR allocations represent the obligation assumed when SDR holdings are distributed to members. IMF members must stand ready to provide currency holdings up to the amount of their SDR allocation. This represents a contractual obligation to deliver cash. Accordingly, SDR allocations are regarded as a financial liability.

B.2 Definition of a Derivative: Examples of Derivatives and Underlyings

What are examples of common derivative contracts and the identified underlying?

IPSAS 41 defines a derivative as follows:

A derivative is a financial instrument or other contract within the scope of this Standard with all three of the following characteristics.

(a) **Its value changes in response to the change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract (sometimes called the "underlying").**

(b) **It requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors.**

(c) **It is settled at a future date.**

Type of contract	**Main pricing-settlement variable (underlying variable)**
Interest rate swap	Interest rates
Currency swap (foreign exchange swap)	Currency rates
Commodity swap	Commodity prices
Equity swap	Equity prices (equity instrument of another entity)
Credit swap	Credit rating, credit index or credit price
Total return swap	Total fair value of the reference asset and interest rates
Purchased or written treasury bond option (call or put)	Interest rates
Purchased or written currency option (call or put)	Currency rates
Purchased or written commodity option (call or put)	Commodity prices
Purchased or written stock option (call or put)	Equity prices (equity instrument of another entity)
Interest rate futures linked to government debt (treasury futures)	Interest rates
Currency futures	Currency rates
Commodity futures	Commodity prices

Type of contract	Main pricing-settlement variable (underlying variable)
Interest rate forward linked to government debt (treasury forward)	Interest rates
Currency forward	Currency rates
Commodity forward	Commodity prices
Equity forward	Equity prices (equity instrument of another entity)

The above list provides examples of contracts that normally qualify as derivatives under IPSAS 41. The list is not exhaustive. Any contract that has an underlying may be a derivative. Moreover, even if an instrument meets the definition of a derivative contract, special provisions may apply, for example, if it is a weather derivative (see paragraph AG1 of IPSAS 41), a contract to buy or sell a non-financial item such as commodity (see paragraphs 6–8 and AG8 of IPSAS 41) or a contract settled in an entity's own shares (see paragraphs 25–29 of IPSAS 28). Therefore, an entity must evaluate the contract to determine whether the other characteristics of a derivative are present and whether special provisions apply.

B.3 Definition of a Derivative: Settlement at a Future Date, Interest Rate Swap with Net or Gross Settlement

For the purpose of determining whether an interest rate swap is a derivative financial instrument under IPSAS 41, does it make a difference whether the parties pay the interest payments to each other (gross settlement) or settle on a net basis?

No. The definition of a derivative does not depend on gross or net settlement.

To illustrate: Entity ABC enters into an interest rate swap with a counterparty (XYZ) that requires ABC to pay a fixed rate of 8 percent and receive a variable amount based on three-month LIBOR, reset on a quarterly basis. The fixed and variable amounts are determined based on a CU100 million notional amount. ABC and XYZ do not exchange the notional amount. ABC pays or receives a net cash amount each quarter based on the difference between 8 percent and three-month LIBOR. Alternatively, settlement may be on a gross basis.

The contract meets the definition of a derivative regardless of whether there is net or gross settlement because its value changes in response to changes in an underlying variable (LIBOR), there is no initial net investment, and settlements occur at future dates.

B.4 Definition of a Derivative: Prepaid Interest Rate Swap (Fixed Rate Payment Obligation Prepaid at Inception or Subsequently)

If a party prepays its obligation under a pay-fixed, receive-variable interest rate swap at inception, is the swap a derivative financial instrument?

Yes. To illustrate: Entity S enters into a CU100 million notional amount five-year pay-fixed, receive-variable interest rate swap with Counterparty C. The interest rate of the variable part of the swap is reset on a quarterly basis to three-month LIBOR. The interest rate of the fixed part of the swap is 10 percent per year. Entity S prepays its fixed obligation under the swap of CU50 million (CU100 million × 10 percent × 5 years) at inception, discounted using market interest rates, while retaining the right to receive interest payments on the CU100 million reset quarterly based on three-month LIBOR over the life of the swap.

The initial net investment in the interest rate swap is significantly less than the notional amount on which the variable payments under the variable leg will be calculated. The contract requires an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors, such as a variable rate bond. Therefore, the contract fulfills the "no initial net investment or an initial net

investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors" provision of IPSAS 41. Even though Entity S has no future performance obligation, the ultimate settlement of the contract is at a future date and the value of the contract changes in response to changes in the LIBOR index. Accordingly, the contract is regarded as a derivative contract.

Would the answer change if the fixed rate payment obligation is prepaid subsequent to initial recognition?

If the fixed leg is prepaid during the term, that would be regarded as a termination of the old swap and an origination of a new instrument that is evaluated under IPSAS 41.

B.5 Definition of a Derivative: Prepaid Pay-Variable, Receive-Fixed Interest Rate Swap

If a party prepays its obligation under a pay-variable, receive-fixed interest rate swap at inception of the contract or subsequently, is the swap a derivative financial instrument?

No. A prepaid pay-variable, receive-fixed interest rate swap is not a derivative if it is prepaid at inception and it is no longer a derivative if it is prepaid after inception because it provides a return on the prepaid (invested) amount comparable to the return on a debt instrument with fixed cash flows. The prepaid amount fails the "no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors" criterion of a derivative.

To illustrate: Entity S enters into a CU100 million notional amount five-year pay-variable, receive-fixed interest rate swap with Counterparty C. The variable leg of the swap is reset on a quarterly basis to three-month LIBOR. The fixed interest payments under the swap are calculated as 10 percent times the swap's notional amount, i.e., CU10 million per year. Entity S prepays its obligation under the variable leg of the swap at inception at current market rates, while retaining the right to receive fixed interest payments of 10 percent on CU100 million per year.

The cash inflows under the contract are equivalent to those of a financial instrument with a fixed annuity stream since Entity S knows it will receive CU10 million per year over the life of the swap. Therefore, all else being equal, the initial investment in the contract should equal that of other financial instruments that consist of fixed annuities. Thus, the initial net investment in the pay-variable, receive-fixed interest rate swap is equal to the investment required in a non-derivative contract that has a similar response to changes in market conditions. For this reason, the instrument fails the "no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors" criterion of IPSAS 41. Therefore, the contract is not accounted for as a derivative under IPSAS 41. By discharging the obligation to pay variable interest rate payments, Entity S in effect provides a loan to Counterparty C.

B.6 Definition of a Derivative: Offsetting Loans

Entity A makes a five-year fixed rate loan to Entity B, while B at the same time makes a five-year variable rate loan for the same amount to A. There are no transfers of contractual par amount at inception of the two loans, since A and B have a netting agreement. Is this a derivative under IPSAS 41?

Yes. This meets the definition of a derivative (that is to say, there is an underlying variable, no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors, and future settlement). The contractual effect of the loans is the equivalent of an interest rate swap arrangement with no initial net investment. Non-derivative transactions are aggregated and treated as a derivative when the transactions result, in substance, in a derivative. Indicators of this would include:

- They are entered into at the same time and in contemplation of one another;
- They have the same counterparty;
- They relate to the same risk; and

- There is no apparent economic need or substantive business purpose for structuring the transactions separately that could not also have been accomplished in a single transaction.

The same answer would apply if Entity A and Entity B did not have a netting agreement, because the definition of a derivative instrument in IPSAS 41 does not require net settlement.

B.7 Definition of a Derivative: Option Not Expected to be Exercised

The definition of a derivative in IPSAS 41 requires that the instrument "is settled at a future date". Is this criterion met even if an option is expected not to be exercised, for example, because it is out of the money?

Yes. An option is settled upon exercise or at its maturity. Expiry at maturity is a form of settlement even though there is no additional exchange of consideration.

B.8 Definition of a Derivative: Foreign Currency Contract Based on Sales Volume

A South African entity, Entity XYZ, whose functional currency is the South African rand, sells electricity to Mozambique denominated in US dollars. XYZ enters into a contract with an investment bank to convert US dollars to rand at a fixed exchange rate. The contract requires XYZ to remit US dollars based on its sales volume in Mozambique in exchange for rand at a fixed exchange rate of 6.00. Is that contract a derivative?

Yes. The contract has two underlying variables (the foreign exchange rate and the volume of sales), no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors, and a payment provision. IPSAS 41 does not exclude from its scope derivatives that are based on sales volume.

B.9 Definition of a Derivative: Prepaid Forward

An entity enters into a forward contract to purchase shares of stock in one year at the forward price. It prepays at inception based on the current price of the shares. Is the forward contract a derivative?

No. The forward contract fails the "no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors" test for a derivative.

To illustrate: Entity XYZ enters into a forward contract to purchase one million T ordinary shares in one year. The current market price of T is CU50 per share; the one-year forward price of T is CU55 per share. XYZ is required to prepay the forward contract at inception with a CU50 million payment. The initial investment in the forward contract of CU50 million is less than the notional amount applied to the underlying, one million shares at the forward price of CU55 per share, i.e., CU55 million. However, the initial net investment approximates the investment that would be required for other types of contracts that would be expected to have a similar response to changes in market factors because T's shares could be purchased at inception for the same price of CU50. Accordingly, the prepaid forward contract does not meet the initial net investment criterion of a derivative instrument.

While this instrument does not meet the definition of a derivative in its entirety, it meets the classification criteria of a financial asset to be measured at fair value through surplus or deficit. As the contractual terms of the forward contract do not include a requirement for Entity XYZ to receive cash flows that are solely payments of principal and interest, the instrument fails the conditions to be measured at amortized cost.

B.10 Definition of a Derivative: Initial Net Investment

Many derivative instruments, such as futures contracts and exchange traded written options, require margin accounts. Is the margin account part of the initial net investment?

No. The margin account is not part of the initial net investment in a derivative instrument. Margin accounts are a form of collateral for the counterparty or clearing house and may take the form of cash, securities or other specified assets, typically liquid assets. Margin accounts are separate assets that are accounted for separately.

B.11 Definition of Held for Trading: Portfolio with a Recent Actual Pattern of Short-Term Profit-Taking

The definition of a financial asset or financial liability held for trading states that "a financial asset or financial liability is classified as held for trading if it is … part of a portfolio of identified financial instruments that are managed together and for which there is evidence of a recent actual pattern of short-term profit-taking". What is a "portfolio" for the purposes of applying this definition?

Although the term "portfolio" is not explicitly defined in IPSAS 41, the context in which it is used suggests that a portfolio is a group of financial assets or financial liabilities that are managed as part of that group (paragraph 9 of IPSAS 41). If there is evidence of a recent actual pattern of short-term profit-taking on financial instruments included in such a portfolio, those financial instruments qualify as held for trading even though an individual financial instrument may in fact be held for a longer period of time.

B.12 Definition of Gross Carrying Amount: Perpetual Debt Instruments with Fixed or Market-Based Variable Rate

Sometimes entities purchase or issue debt instruments that are required to be measured at amortized cost and in respect of which the issuer has no obligation to repay the gross carrying amount. The interest rate may be fixed or variable. Would the difference between the initial amount paid or received and zero ("the maturity amount") be amortized immediately on initial recognition for the purpose of determining amortized cost if the rate of interest is fixed or specified as a market-based variable rate?

No. Since there are no repayment of the gross carrying amount, there is no amortization of the difference between the initial amount and the maturity amount if the rate of interest is fixed or specified as a market-based variable rate. Because interest payments are fixed or market-based and will be paid in perpetuity, the amortized cost (the present value of the stream of future cash payments discounted at the effective interest rate) equals the gross carrying amount in each period.

B.13 Definition of Gross Carrying Amount: Perpetual Debt Instruments with Decreasing Interest Rate

If the stated rate of interest on a perpetual debt instrument decreases over time, would the gross carrying amount equal the contractual par amount in each period?

No. From an economic perspective, some or all of the contractual interest payments are repayments of the gross carrying amount. For example, the interest rate may be stated as 16 percent for the first ten years and as zero percent in subsequent periods. In that case, the initial amount is amortized to zero over the first ten years using the effective interest method, since a portion of the contractual interest payments represents repayments of the gross carrying amount. The gross carrying amount is zero after year ten because the present value of the stream of future cash payments in subsequent periods is zero (there are no further contractual cash payments in subsequent periods).

B.14 Example of Calculating the Gross Carrying Amount: Financial Asset

How is the gross carrying amount calculated for financial assets measured at amortized cost in accordance with IPSAS 41?

The gross carrying amount is calculated using the effective interest method. The effective interest rate inherent in a financial instrument is the rate that exactly discounts the estimated cash flows associated with the financial instrument through the expected life of the instrument or, where appropriate, a shorter period to the gross carrying amount at initial recognition. The computation includes all fees and points paid or received that are an integral part of the effective interest rate, directly attributable transaction costs and all other premiums or discounts.

The following example illustrates how the gross carrying amount is calculated using the effective interest method. Entity A purchases a debt instrument with five years remaining to maturity for its fair value of CU1,000 (including transaction costs). The instrument has a contractual par amount of CU1,250 and carries fixed interest of 4.7 percent that is paid annually (CU1,250 × 4.7 percent = CU59 per year). The contract also specifies that the borrower has an option to prepay the instrument at par and that no penalty will be charged for prepayment. At inception, the entity expects the borrower not to prepay (and, therefore, the entity determines that the fair value of the prepayment feature is insignificant when the financial asset is initially recognized).

It can be shown that in order to allocate interest receipts and the initial discount over the term of the debt instrument at a constant rate on the carrying amount, they must be accrued at the rate of ten percent annually. The table below provides information about the gross carrying amount, interest revenue and cash flows of the debt instrument in each reporting period.

Year	**(a)**	**(b = a × 10 percent)**	**(c)**	**(d = a + b – c)**
	Gross carrying amount at the beginning of the year	**Interest revenue**	**Cash flows**	**Gross carrying amount at the end of the year**
20X0	1,000	100	59	1,041
20X1	1,041	104	59	1,086
20X2	1,086	109	59	1,136
20X3	1,136	113	59	1,190
20X4	1,190	119	1,250 + 59	–

On the first day of 20X2 the entity revises its estimate of cash flows. It now expects that 50 percent of the contractual par amount will be prepaid at the end of 20X2 and the remaining 50 percent at the end of 20X4. In accordance with paragraph AG161 of IPSAS 41, the gross carrying amount of the debt instrument in 20X2 is adjusted. The gross carrying amount is recalculated by discounting the amount the entity expects to receive in 20X2 and subsequent years using the original effective interest rate (10 percent). This results in the new gross carrying amount in 20X2 of CU1,138. The adjustment of CU52 (CU1,138 – CU1,086) is recorded in surplus or deficit in 20X2. The table below provides information about the gross carrying amount, interest revenue and cash flows as they would be adjusted taking into account the change in estimate.

Year	**(a)**	**(b = a × 10 percent)**	**(c)**	**(d = a + b – c)**
	Gross carrying amount at the beginning of the year	**Interest revenue**	**Cash flows**	**Gross carrying amount at the end of the year**
20X0	1,000	100	59	1,041
20X1	1,041	104	59	1,086
20X2	1,086 + 52	114	625 + 59	568
20X3	568	57	30	595
20X4	595	60	625 + 30	–

B.15 Example of Calculating the Gross Carrying Amount: Debt Instruments with Stepped Interest Payments

Sometimes entities purchase or issue debt instruments with a predetermined rate of interest that increases or decreases progressively ("stepped interest") over the term of the debt instrument. If a debt instrument with

stepped interest is issued at CU1,250 and has a maturity amount of CU1,250, would the gross carrying amount equal CU1,250 in each reporting period over the term of the debt instrument?

No. Although there is no difference between the initial amount and maturity amount, an entity uses the effective interest method to allocate interest payments over the term of the debt instrument to achieve a constant rate on the carrying amount.

The following example illustrates how the gross carrying amount is calculated using the effective interest method for an instrument with a predetermined rate of interest that increases or decreases over the term of the debt instrument ("stepped interest").

On January 1, 20X0, Entity A issues a debt instrument for a price of CU1,250. The contractual par amount is CU1,250 and the debt instrument is repayable on December 31, 20X4. The rate of interest is specified in the debt agreement as a percentage of the contractual par amount as follows: 6.0 percent in 20X0 (CU75), 8.0 percent in 20X1 (CU100), 10.0 percent in 20X2 (CU125), 12.0 percent in 20X3 (CU150), and 16.4 percent in 20X4 (CU205). In this case, the interest rate that exactly discounts the stream of future cash payments through maturity is ten percent. Therefore, cash interest payments are reallocated over the term of the debt instrument for the purposes of determining the gross carrying amount in each period. In each period, the gross carrying amount at the beginning of the period is multiplied by the effective interest rate of ten percent and added to the gross carrying amount. Any cash payments in the period are deducted from the resulting number. Accordingly, the gross carrying amount in each period is as follows:

Year	**(a)**	**(b = a × 10 percent)**	**(c)**	**(d = a + b – c)**
	Gross carrying amount at the beginning of the year	**Interest revenue**	**Cash flows**	**Gross carrying amount at the end of the year**
20X0	1,250	125	75	1,300
20X1	1,300	130	100	1,330
20X2	1,330	133	125	1,338
20X3	1,338	134	150	1,322
20X4	1,322	133	1,250 + 205	–

B.16 Regular Way Contracts: No Established Market

Can a contract to purchase a financial asset be a regular way contract if there is no established market for trading such a contract?

Yes. IPSAS 41 refers to terms that require delivery of the asset within the time frame established generally by regulation or convention in the marketplace concerned. Marketplace is not limited to a formal stock exchange or organized over-the-counter market. Instead, it means the environment in which the financial asset is customarily exchanged. An acceptable time frame would be the period reasonably and customarily required for the parties to complete the transaction and prepare and execute closing documents.

For example, a market for private issue financial instruments can be a marketplace.

B.17 Regular Way Contracts: Forward Contract

Entity ABC enters into a forward contract to purchase one million of M's ordinary shares in two months for CU10 per share. The contract is not an exchange-traded contract. The contract requires ABC to take physical delivery of the shares and pay the counterparty CU10 million in cash. M's shares trade in an active public

market at an average of 100,000 shares a day. Regular way delivery is three days. Is the forward contract regarded as a regular way contract?

No. The contract must be accounted for as a derivative because it is not settled in the way established by regulation or convention in the marketplace concerned.

B.18 Regular Way Contracts: Which Customary Settlement Provisions Apply?

If an entity's financial instruments trade in more than one active market, and the settlement provisions differ in the various active markets, which provisions apply in assessing whether a contract to purchase those financial instruments is a regular way contract?

The provisions that apply are those in the market in which the purchase actually takes place.

To illustrate: Entity XYZ purchases one million shares of Entity ABC on a US stock exchange, for example, through a broker. The settlement date of the contract is six business days later. Trades for equity shares on US exchanges customarily settle in three business days. Because the trade settles in six business days, it does not meet the exemption as a regular way trade.

However, if XYZ did the same transaction on a foreign exchange that has a customary settlement period of six business days, the contract would meet the exemption for a regular way trade.

B.19 Regular Way Contracts: Share Purchase by Call Option

Entity A purchases a call option in a public market permitting it to purchase 100 shares of Entity XYZ at any time over the next three months at a price of CU100 per share. If Entity A exercises its option, it has 14 days to settle the transaction according to regulation or convention in the options market. XYZ shares are traded in an active public market that requires three-day settlement. Is the purchase of shares by exercising the option a regular way purchase of shares?

Yes. The settlement of an option is governed by regulation or convention in the marketplace for options and, therefore, upon exercise of the option it is no longer accounted for as a derivative because settlement by delivery of the shares within 14 days is a regular way transaction.

B.20 Recognition and Derecognition of Financial Liabilities Using Trade Date or Settlement Date Accounting

IPSAS 41 has special rules about recognition and derecognition of financial assets using trade date or settlement date accounting. Do these rules apply to transactions in financial instruments that are classified as financial liabilities, such as transactions in deposit liabilities and trading liabilities?

No. IPSAS 41 does not contain any specific requirements about trade date accounting and settlement date accounting in the case of transactions in financial instruments that are classified as financial liabilities. Therefore, the general recognition and derecognition requirements in paragraphs 10 and 35 of IPSAS 41 apply. Paragraph 10 of IPSAS 41 states that financial liabilities are recognized on the date the entity 'becomes a party to the contractual provisions of the instrument'. Such contracts generally are not recognized unless one of the parties has performed or the contract is a derivative contract not exempted from the scope of IPSAS 41. Paragraph 35 of IPSAS 41 specifies that financial liabilities are derecognized only when they are extinguished, i.e., when the obligation specified in the contract is discharged or canceled or expires.

Section C Embedded derivatives

C.1 Embedded Derivatives: Separation of Host Debt Instrument

If an embedded non-option derivative is required to be separated from a host debt instrument, how are the terms of the host debt instrument and the embedded derivative identified? For example, would the host debt instrument be a fixed rate instrument, a variable rate instrument or a zero coupon instrument?

The terms of the host debt instrument reflect the stated or implied substantive terms of the hybrid contract. In the absence of implied or stated terms, the entity makes its own judgment of the terms. However, an entity may not identify a component that is not specified or may not establish terms of the host debt instrument in a manner that would result in the separation of an embedded derivative that is not already clearly present in the hybrid contract, that is to say, it cannot create a cash flow that does not exist. For example, if a five-year debt instrument has fixed interest payments of CU40,000 annually and a contractual payment at maturity of CU1,000,000 multiplied by the change in an equity price index, it would be inappropriate to identify a floating rate host contract and an embedded equity swap that has an offsetting floating rate leg in lieu of identifying a fixed rate host. In that example, the host contract is a fixed rate debt instrument that pays CU40,000 annually because there are no floating interest rate cash flows in the hybrid contract.

In addition, the terms of an embedded non-option derivative, such as a forward or swap, must be determined so as to result in the embedded derivative having a fair value of zero at the inception of the hybrid contract. If it were permitted to separate embedded non-option derivatives on other terms, a single hybrid contract could be decomposed into an infinite variety of combinations of host debt instruments and embedded derivatives, for example, by separating embedded derivatives with terms that create leverage, asymmetry or some other risk exposure not already present in the hybrid contract. Therefore, it is inappropriate to separate an embedded non-option derivative on terms that result in a fair value other than zero at the inception of the hybrid contract. The determination of the terms of the embedded derivative is based on the conditions existing when the financial instrument was issued.

C.2 Embedded Derivatives: Separation of Embedded Option

The response to Question C.1 states that the terms of an embedded non-option derivative should be determined so as to result in the embedded derivative having a fair value of zero at the initial recognition of the hybrid contract. When an embedded option-based derivative is separated, must the terms of the embedded option be determined so as to result in the embedded derivative having either a fair value of zero or an intrinsic value of zero (that is to say, be at the money) at the inception of the hybrid contract?

No. The economic behavior of a hybrid contract with an option-based embedded derivative depends critically on the strike price (or strike rate) specified for the option feature in the hybrid contract, as discussed below. Therefore, the separation of an option-based embedded derivative (including any embedded put, call, cap, floor, caption, floortion or swaption feature in a hybrid contract) should be based on the stated terms of the option feature documented in the hybrid contract. As a result, the embedded derivative would not necessarily have a fair value or intrinsic value equal to zero at the initial recognition of the hybrid contract.

If an entity were required to identify the terms of an embedded option-based derivative so as to achieve a fair value of the embedded derivative of zero, the strike price (or strike rate) generally would have to be determined so as to result in the option being infinitely out of the money. This would imply a zero probability of the option feature being exercised. However, since the probability of the option feature in a hybrid contract being exercised generally is not zero, it would be inconsistent with the likely economic behavior of the hybrid contract to assume an initial fair value of zero. Similarly, if an entity were required to identify the terms of an embedded option-based derivative so as to achieve an intrinsic value of zero for the embedded derivative, the strike price (or strike rate) would have to be assumed to equal the price (or rate) of the underlying variable at the initial recognition of the hybrid contract. In this case, the fair value of the option would consist only of time value. However, such an assumption would not be consistent with the likely economic behavior of the hybrid contract, including the probability of the option feature being exercised, unless the agreed strike price was indeed equal to the price (or rate) of the underlying variable at the initial recognition of the hybrid contract.

The economic nature of an option-based embedded derivative is fundamentally different from a forward-based embedded derivative (including forwards and swaps), because the terms of a forward are such that a payment based on the difference between the price of the underlying and the forward price will occur at a specified date, while the terms of an option are such that a payment based on the difference between the price of the underlying and the strike price of the option may or may not occur depending on the relationship between the agreed strike price and the price of the underlying at a specified date or dates in the future. Adjusting the strike price of an option-based embedded derivative,

therefore, alters the nature of the hybrid contract. On the other hand, if the terms of a non-option embedded derivative in a host debt instrument were determined so as to result in a fair value of any amount other than zero at the inception of the hybrid contract, that amount would essentially represent a borrowing or lending. Accordingly, as discussed in the answer to Question C.1, it is not appropriate to separate a non-option embedded derivative in a host debt instrument on terms that result in a fair value other than zero at the initial recognition of the hybrid contract.

C.3 Embedded Derivatives: Equity Kicker

In some instances, investment entities providing subordinated loans agree that if and when the borrower lists its shares on a stock exchange, the venture capital entity is entitled to receive shares of the borrowing entity free of charge or at a very low price (an "equity kicker") in addition to the contractual payments. As a result of the equity kicker feature, the interest on the subordinated loan is lower than it would otherwise be. Assuming that the subordinated loan is not measured at fair value with changes in fair value recognized in surplus or deficit (paragraph 49(c) of IPSAS 41), does the equity kicker feature meet the definition of an embedded derivative even though it is contingent upon the future listing of the borrower?

Yes. The economic characteristics and risks of an equity return are not closely related to the economic characteristics and risks of a host debt instrument (paragraph 49(a) of IPSAS 41). The equity kicker meets the definition of a derivative because it has a value that changes in response to the change in the price of the shares of the borrower, it requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors, and it is settled at a future date (paragraph 49(b) and paragraph 9 of IPSAS 41). The equity kicker feature meets the definition of a derivative even though the right to receive shares is contingent upon the future listing of the borrower. Paragraph AG7 of IPSAS 41 states that a derivative could require a payment as a result of some future event that is unrelated to a notional amount. An equity kicker feature is similar to such a derivative except that it does not give a right to a fixed payment, but an option right, if the future event occurs.

C.4 Embedded Derivatives: Synthetic Instruments

Entity A issues a five-year floating rate debt instrument. At the same time, it enters into a five-year pay-fixed, receive-variable interest rate swap with Entity B. Entity A regards the combination of the debt instrument and swap as a synthetic fixed rate instrument. Entity A contends that separate accounting for the swap is inappropriate since paragraph AG106(a) of IPSAS 41 requires an embedded derivative to be classified together with its host instrument if the derivative is linked to an interest rate that can change the amount of contractual interest that would otherwise be paid or received on the host debt contract. Is the entity's analysis correct?

No. Embedded derivative instruments are terms and conditions that are included in non-derivative host contracts. It is generally inappropriate to treat two or more separate financial instruments as a single combined instrument ("synthetic instrument" accounting) for the purpose of applying IPSAS 41. Each of the financial instruments has its own terms and conditions and each may be transferred or settled separately. Therefore, the debt instrument and the swap are classified separately. The transactions described here differ from the transactions discussed in Question B.6, which had no substance apart from the resulting interest rate swap.

C.5 Embedded Derivatives: Purchases and Sales Contracts in Foreign Currency Instruments

A supply contract provides for payment in a currency other than (a) the functional currency of either party to the contract, (b) the currency in which the product is routinely denominated in commercial transactions around the world and (c) the currency that is commonly used in contracts to purchase or sell non-financial items in the economic environment in which the transaction takes place. Is there an embedded derivative that should be separated under IPSAS 41?

Yes. To illustrate: a Norwegian entity agrees to sell oil to an entity in France. The oil contract is denominated in Swiss francs, although oil contracts are routinely denominated in US dollars in commercial transactions around the world, and

Norwegian krone are commonly used in contracts to purchase or sell non-financial items in Norway. Neither entity carries out any significant activities in Swiss francs. In this case, the Norwegian entity regards the supply contract as a host contract with an embedded foreign currency forward to purchase Swiss francs. The French entity regards the supply contact as a host contract with an embedded foreign currency forward to sell Swiss francs. Each entity includes fair value changes on the currency forward in surplus or deficit unless the reporting entity designates it as a cash flow hedging instrument, if appropriate.

C.6 Embedded Foreign Currency Derivatives: Unrelated Foreign Currency Provision

Entity A, which measures items in its financial statements on the basis of the euro (its functional currency), enters into a contract with Entity B, which has the Norwegian krone as its functional currency, to purchase oil in six months for 1,000 US dollars. The host oil contract is not within the scope of IPSAS 41 because it was entered into and continues to be for the purpose of delivery of a non-financial item in accordance with the entity's expected purchase, sale or usage requirements (paragraphs 5 and AG8 of IPSAS 41) and the entity has not irrevocably designated it as measured at fair value through surplus or deficit in accordance with paragraph 6 of IPSAS 41. The oil contract includes a leveraged foreign exchange provision that states that the parties, in addition to the provision of, and payment for, oil will exchange an amount equal to the fluctuation in the exchange rate of the US dollar and Norwegian krone applied to a notional amount of 100,000 US dollars. Under paragraph 49 of IPSAS 41, is that embedded derivative (the leveraged foreign exchange provision) regarded as closely related to the host oil contract?

No, that leveraged foreign exchange provision is separated from the host oil contract because it is not closely related to the host oil contract (paragraph AG106(d) of IPSAS 41).

The payment provision under the host oil contract of 1,000 US dollars can be viewed as a foreign currency derivative because the US dollar is neither Entity A's nor Entity B's functional currency. This foreign currency derivative would not be separated because it follows from paragraph AG106(d) of IPSAS 41 that a crude oil contract that requires payment in US dollars is not regarded as a host contract with a foreign currency derivative.

The leveraged foreign exchange provision that states that the parties will exchange an amount equal to the fluctuation in the exchange rate of the US dollar and Norwegian krone applied to a notional amount of 100,000 US dollars is in addition to the required payment for the oil transaction. It is unrelated to the host oil contract and therefore separated from the host oil contract and accounted for as an embedded derivative under paragraph 49 of IPSAS 41.

C.7 Embedded Foreign Currency Derivatives: Currency of International Commerce

Paragraph AG106(d) of IPSAS 41 refers to the currency in which the price of the related goods or services is routinely denominated in commercial transactions around the world. Could it be a currency that is used for a certain product or service in commercial transactions within the local area of one of the substantial parties to the contract?

No. The currency in which the price of the related goods or services is routinely denominated in commercial transactions around the world is only a currency that is used for similar transactions all around the world, not just in one local area. For example, if cross-border transactions in natural gas in North America are routinely denominated in US dollars and such transactions are routinely denominated in euro in Europe, neither the US dollar nor the euro is a currency in which the goods or services are routinely denominated in commercial transactions around the world.

C.8 Embedded Derivatives: Holder Permitted, but not Required, to Settle Without Recovering Substantially All of its Recognized Investment

If the terms of a combined contract permit, but do not require, the holder to settle the combined contract in a manner that causes it not to recover substantially all of its recognized investment and the issuer does not have such a right (for example, a puttable debt instrument), does the contract satisfy the condition in

paragraph AG106(a) of IPSAS 41 that the holder would not recover substantially all of its recognized investment?

No. The condition that "the holder would not recover substantially all of its recognized investment" is not satisfied if the terms of the combined contract permit, but do not require, the investor to settle the combined contract in a manner that causes it not to recover substantially all of its recognized investment and the issuer has no such right. Accordingly, an interest-bearing host contract with an embedded interest rate derivative with such terms is regarded as closely related to the host contract. The condition that "the holder would not recover substantially all of its recognized investment" applies to situations in which the holder can be forced to accept settlement at an amount that causes the holder not to recover substantially all of its recognized investment.

Section D Recognition and Derecognition

D.1 Initial Recognition

D.1.1 Recognition: Cash Collateral

Entity B transfers cash to Entity A as collateral for another transaction with Entity A (for example, a securities borrowing transaction). The cash is not legally segregated from Entity A's assets. Should Entity A recognize the cash collateral it has received as an asset?

Yes. The ultimate realization of a financial asset is its conversion into cash and, therefore, no further transformation is required before the economic benefits of the cash transferred by Entity B can be realized by Entity A. Therefore, Entity A recognizes the cash as an asset and a payable to Entity B while Entity B derecognizes the cash and recognizes a receivable from Entity A.

D.2 Regular Way Purchase or Sale of a Financial Asset

D.2.1 Trade Date vs Settlement Date: Amounts to be Recorded for a Purchase

How are the trade date and settlement date accounting principles in IPSAS 41 applied to a purchase of a financial asset?

The following example illustrates the application of the trade date and settlement date accounting principles in IPSAS 41 for a purchase of a financial asset. On December 29, 20X1, an entity commits itself to purchase a financial asset for CU1,000, which is its fair value on commitment (trade) date. Transaction costs are immaterial. On December 31, 20X1 (financial year-end) and on January 4, 20X2 (settlement date) the fair value of the asset is CU1,002 and CU1,003, respectively. The amounts to be recorded for the asset will depend on how it is classified and whether trade date or settlement date accounting is used, as shown in the two tables below.

Settlement date accounting			
Balances	**Financial assets measured at amortized cost**	**Financial assets measured at fair value through net assets/equity**	**Financial assets measured at fair value through surplus/deficit**
December 29, 20X1			
Financial asset	–	–	–
Financial liability	–	–	–
December 31, 20X1			
Receivable	–	2	2

Settlement date accounting			
Financial asset	–	–	–
Financial liability	–	–	–
Net assets/equity (fair value adjustment)	–	(2)	–
Accumulated surplus or deficit (through surplus or deficit)	–	–	(2)
January 4, 20X2			
Receivable	–	–	–
Financial asset	1,000	1,003	1,003
Financial liability	–	–	–
Net assets/equity (fair value adjustment)	–	(3)	–
Accumulated surplus or deficit (through surplus or deficit)	–	–	(3)

Trade date accounting			
Balances	**Financial assets measured at amortized cost**	**Financial assets measured at fair value through net assets/equity**	**Financial assets measured at fair value through surplus or deficit**
December 29, 20X1			
Financial asset	1,000	1,000	1,000
Financial liability	(1,000)	(1,000)	(1,000)
December 31, 20X1			
Receivable	–	–	–
Financial asset	1,000	1,002	1,002
Financial liability	(1,000)	(1,000)	(1,000)
Net assets/equity (fair value adjustment)	–	(2)	–
Accumulated surplus or deficit (through surplus or deficit)	–	–	(2)
January 4, 20X2			
Receivable	–	–	–
Financial asset	1,000	1,003	1,003

Settlement date accounting			
Financial liability	–	–	–
Net assets/equity (fair value adjustment)	–	(3)	–
Accumulated surplus or deficit (through surplus or deficit)	–	–	(3)

D.2.2 Trade Date vs Settlement Date: Amounts to be Recorded for a Sale

How are the trade date and settlement date accounting principles in IPSAS 41 applied to a sale of a financial asset?

The following example illustrates the application of the trade date and settlement date accounting principles in IPSAS 41 for a sale of a financial asset. On December 29, 20X2 (trade date) an entity enters into a contract to sell a financial asset for its current fair value of CU1,010. The asset was acquired one year earlier for CU1,000 and its gross carrying amount is CU1,000. On December 31, 20X2 (financial year-end), the fair value of the asset is CU1,012. On January 4, 20X3 (settlement date), the fair value is CU1,013. The amounts to be recorded will depend on how the asset is classified and whether trade date or settlement date accounting is used as shown in the two tables below (any loss allowance or interest revenue on the financial asset is disregarded for the purpose of this example).

A change in the fair value of a financial asset that is sold on a regular way basis is not recorded in the financial statements between trade date and settlement date even if the entity applies settlement date accounting because the seller's right to changes in the fair value ceases on the trade date.

Settlement date accounting			
Balances	**Financial assets measured at amortized cost**	**Financial assets measured at fair value through net assets/equity**	**Financial assets measured at fair value through surplus or deficit**
December 29, 20X2			
Receivable	–	–	–
Financial asset	1,000	1,010	1,010
Net assets/equity (fair value adjustment)	–	10	–
Accumulated surplus or deficit (through surplus or deficit)	–	–	10
December 31, 20X2			
Receivable	–	–	–
Financial asset	1,000	1,010	1,010
Net assets/equity (fair value adjustment)	–	10	–
Accumulated surplus or deficit (through surplus or deficit)	–	–	10

Settlement date accounting			
January 4, 20X3			
Net assets/equity (fair value adjustment)	–	–	–
Accumulated surplus or deficit (through surplus or deficit)	10	10	10

Trade date accounting			
Balances	**Financial assets measured at amortized cost**	**Financial assets measured at fair value through net assets/equity**	**Financial assets measured at fair value through surplus or deficit**
December 29, 20X2			
Receivable	1,010	1,010	1,010
Financial asset	–	–	–
Net assets/equity (fair value adjustment)	–	–	–
Accumulated surplus or deficit (through surplus or deficit)	10	10	10
December 31, 20X2			
Receivable	1,010	1,010	1,010
Financial asset	–	–	–
Net assets/equity (fair value adjustment)	–	–	–
Accumulated surplus or deficit (through surplus or deficit)	10	10	10
January 4, 20X3			
Net assets/equity (fair value adjustment)	–	–	–
Accumulated surplus or deficit (through surplus or deficit)	10	10	10

D.2.3 Settlement Date Accounting: Exchange of Non-Cash Financial Assets

If an entity recognizes sales of financial assets using settlement date accounting, would a change in the fair value of a financial asset to be received in exchange for the non-cash financial asset that is sold be recognized in accordance with paragraph 105 of IPSAS 41?

It depends. Any change in the fair value of the financial asset to be received would be accounted for under paragraph 105 of IPSAS 41 if the entity applies settlement date accounting for that category of financial assets. However, if the entity classifies the financial asset to be received in a category for which it applies trade date accounting,

the asset to be received is recognized on the trade date as described in paragraph AG19 of IPSAS 41. In that case, the entity recognizes a liability of an amount equal to the carrying amount of the financial asset to be delivered on settlement date.

To illustrate: on December 29, 20X2 (trade date) Entity A enters into a contract to sell Note Receivable A, which is measured at amortized cost, in exchange for Bond B, which meets the definition of held for trading and is measured at fair value. Both assets have a fair value of CU1,010 on December 29, while the amortized cost of Note Receivable A is CU1,000. Entity A uses settlement date accounting for financial assets measured at amortized cost and trade date accounting for assets that meet the definition of held for trading. On December 31, 20X2 (financial year-end), the fair value of Note Receivable A is CU1,012 and the fair value of Bond B is CU1,009. On January 4, 20X3, the fair value of Note Receivable A is CU1,013 and the fair value of Bond B is CU1,007. The following entries are made:

Section E Measurement

E.1 Initial Measurement of Financial Assets and Financial Liabilities

E.1.1 Initial Measurement: Transaction Costs

Transaction costs should be included in the initial measurement of financial assets and financial liabilities other than those at fair value through surplus or deficit. How should this requirement be applied in practice?

For financial assets not measured at fair value through surplus or deficit, transaction costs are added to the fair value at initial recognition. For financial liabilities, transaction costs are deducted from the fair value at initial recognition.

For financial instruments that are measured at amortized cost, transaction costs are subsequently included in the calculation of amortized cost using the effective interest method and, in effect, amortized through surplus or deficit over the life of the instrument.

For financial instruments that are measured at fair value through net assets/equity in accordance with either paragraphs 41 and 111 or paragraphs 43 and 106 of IPSAS 41, transaction costs are recognized in net assets/equity as part of a change in fair value at the next remeasurement. If the financial asset is measured in accordance with paragraphs 41 and 111 of IPSAS 41, those transaction costs are amortized to surplus or deficit using the effective interest method and, in effect, amortized through surplus or deficit over the life of the instrument.

Transaction costs expected to be incurred on transfer or disposal of a financial instrument are not included in the measurement of the financial instrument.

E.2 Gains and Losses

E.2.1 IPSAS 41 and IPSAS 4—Financial Assets Measured at Fair Value through Net Assets/Equity: Separation of Currency Component

A financial asset measured at fair value through net assets/equity in accordance with paragraph 41 of IPSAS 41 is treated as a monetary item. Therefore, the entity recognizes changes in the carrying amount relating to changes in foreign exchange rates in surplus or deficit in accordance with paragraphs 27(a) and 32 of IPSAS 4 and other changes in the carrying amount in net assets/equity in accordance with IPSAS 41. How is the cumulative gain or loss that is recognized in net assets/equity determined?

It is the difference between the amortized cost of the financial asset[58] and the fair value of the financial asset in the functional currency of the reporting entity. For the purpose of applying paragraph 32 of IPSAS 4 the asset is treated as an asset measured at amortized cost in the foreign currency.

To illustrate: on December 31, 20X1 Entity A acquires a bond denominated in a foreign currency (FC) for its fair value of FC1,000. The bond has five years remaining to maturity and a contractual par amount of FC1,250, carries fixed interest of 4.7 percent that is paid annually (FC1,250 × 4.7 percent = FC59 per year), and has an effective interest rate of 10 percent. Entity A classifies the bond as subsequently measured at fair value through net assets/equity in accordance with paragraph 41 of IPSAS 41, and thus recognizes gains and losses in net assets/equity. The entity's functional currency is its local currency (LC). The exchange rate is FC1 to LC1.5 and the carrying amount of the bond is LC1,500 (= FC1,000 × 1.5).

Dr	Bond		LC1,500	
	Cr	Cash		LC1,500

On December 31, 20X2, the foreign currency has appreciated and the exchange rate is FC1 to LC2. The fair value of the bond is FC1,060 and thus the carrying amount is LC2,120 (= FC1,060 × 2). The amortized cost is FC1,041 (= LC2,082). In this case, the cumulative gain or loss to be recognized in net assets/equity and accumulated in net assets/equity is the difference between the fair value and the amortized cost on December 31, 20X2, i.e., LC38 (= LC2,120 – LC2,082).

Interest received on the bond on December 31, 20X2 is FC59 (= LC118). Interest revenue determined in accordance with the effective interest method is FC100 (= FC1,000 × 10 percent). The average exchange rate during the year is FC1 to LC1.75. For the purpose of this question, it is assumed that the use of the average exchange rate provides a reliable approximation of the spot rates applicable to the accrual of interest revenue during the year (see paragraph 25 of IPSAS 41). Thus, reported interest revenue is LC175 (= FC100 × 1.75) including accretion of the initial discount of LC72 (= [FC100 – FC59] × 1.75). Accordingly, the exchange difference on the bond that is recognized in surplus or deficit is LC510 (= LC2,082 – LC1,500 – LC72). Also, there is an exchange gain on the interest receivable for the year of LC15 (= FC59 × [2.00 – 1.75]).

[58] The objective of this example is to illustrate the separation of the currency component for a financial asset that is measured at fair value through net assets/equity in accordance with paragraph 41 of IPSAS 41. Consequently, for simplicity, this example does not reflect the effect of the impairment requirements in paragraphs 73-93 of IPSAS 41.

Dr	Bond		LC620	
Dr	Cash		LC118	
	Cr	Interest revenue		LC175
	Cr	Exchange gain		LC525
	Cr	Fair value change in net assets/equity		LC38

On December 31, 20X3, the foreign currency has appreciated further and the exchange rate is FC1 to LC2.50. The fair value of the bond is FC1,070 and thus the carrying amount is LC2,675 (= FC1,070 × 2.50). The amortized cost is FC1,086 (= LC2,715). The cumulative gain or loss to be accumulated in net assets/equity is the difference between the fair value and the amortized cost on December 31, 20X3, i.e., negative LC40 (= LC2,675 – LC2,715). Thus, the amount recognized in net assets/equity equals the change in the difference during 20X3 of LC78 (= LC40 + LC38).

Interest received on the bond on December 31, 20X3 is FC59 (= LC148). Interest revenue determined in accordance with the effective interest method is FC104 (= FC1,041 × 10 percent). The average exchange rate during the year is FC1 to LC2.25. For the purpose of this question, it is assumed that the use of the average exchange rate provides a reliable approximation of the spot rates applicable to the accrual of interest revenue during the year (see paragraph 25 of IPSAS 4). Thus, recognized interest revenue is LC234 (= FC104 × 2.25) including accretion of the initial discount of LC101 (= [FC104 – FC59] × 2.25). Accordingly, the exchange difference on the bond that is recognized in surplus or deficit is LC532 (= LC2,715 – LC2,082 – LC101). Also, there is an exchange gain on the interest receivable for the year of LC15 (= FC59 × [2.50 – 2.25]).

E.2.2 IPSAS 41 and IPSAS 4—Exchange Differences Arising on Translation of Foreign Entities: Net Assets/Equity or Surplus or Deficit?

Paragraphs 37 and 57 of IPSAS 4 state that all exchange differences resulting from translating the financial statements of a foreign operation should be recognized in net assets/equity until disposal of the net investment. This would include exchange differences arising from financial instruments carried at fair value, which would include both financial assets measured at fair value through surplus or deficit and financial assets that are measured at fair value through net assets/equity in accordance with IPSAS 41.

IPSAS 41 requires that changes in fair value of financial assets measured at fair value through surplus or deficit should be recognized in surplus or deficit and changes in fair value of financial assets measured at fair value through net assets/equity should be recognized in net assets/equity.

If the foreign operation is a controlled entity whose financial statements are consolidated with those of its controlling entity, in the consolidated financial statements how are IPSAS 41 and paragraph 44 of IPSAS 4 applied?

IPSAS 41 applies in the accounting for financial instruments in the financial statements of a foreign operation and IPSAS 4 applies in translating the financial statements of a foreign operation for incorporation in the financial statements of the reporting entity.

To illustrate: Entity A is domiciled in Country X and its functional currency and presentation currency are the local currency of Country X (LCX). A has a foreign controlled entity (Entity B) in Country Y whose functional currency is the local currency of Country Y (LCY). B is the owner of a debt instrument, which meets the definition of held for trading and is therefore measured at fair value through surplus or deficit in accordance with IPSAS 41.

In B's financial statements for year 20X0, the fair value and carrying amount of the debt instrument is LCY100 in the local currency of Country Y. In A's consolidated financial statements, the asset is translated into the local currency of Country X at the spot exchange rate applicable at the end of the reporting period (2.00). Thus, the carrying amount is LCX200 (= LCY100 × 2.00) in the consolidated financial statements.

At the end of year 20X1, the fair value of the debt instrument has increased to LCY110 in the local currency of Country Y. B recognizes the trading asset at LCY110 in its statement of financial position and recognizes a fair value gain of LCY10 in its surplus or deficit. During the year, the spot exchange rate has increased from 2.00 to 3.00 resulting in an increase in the fair value of the instrument from LCX200 to LCX330 (= LCY110 × 3.00) in the currency of Country X. Therefore, Entity A recognizes the trading asset at LCX330 in its consolidated financial statements.

Entity A translates the statement of changes in net assets/equity of B "at the exchange rates at the dates of the transactions" (paragraph 44(b) of IPSAS 4). Since the fair value gain has accrued through the year, A uses the average rate as a practical approximation ([3.00 + 2.00] / 2 = 2.50, in accordance with paragraph 25 of IPSAS 4). Therefore, while the fair value of the trading asset has increased by LCX130 (= LCX330 – LCX200), Entity A recognizes only LCX25 (= LCY10 × 2.5) of this increase in consolidated surplus or deficit to comply with paragraph 44(b) of IPSAS 4. The resulting exchange difference, i.e., the remaining increase in the fair value of the debt instrument (LCX130 – LCX25 = LCX105), is accumulated in net assets/equity until the disposal of the net investment in the foreign operation in accordance with paragraph 57 of IPSAS 4.

E.2.3 IPSAS 41 and IPSAS 4—Interaction Between IPSAS 41 and IPSAS 4

IPSAS 41 includes requirements about the measurement of financial assets and financial liabilities and the recognition of gains and losses on remeasurement in surplus or deficit. IPSAS 4 includes rules about the reporting of foreign currency items and the recognition of exchange differences in surplus or deficit. In what order are IPSAS 4 and IPSAS 41 applied?

Statement of Financial Position

Generally, the measurement of a financial asset or financial liability at fair value or amortized cost is first determined in the foreign currency in which the item is denominated in accordance with IPSAS 41. Then, the foreign currency amount is translated into the functional currency using the closing rate or a historical rate in accordance with IAS 21 (paragraph AG224 of IPSAS 41). For example, if a monetary financial asset (such as a debt instrument) is measured at amortized cost in accordance with IPSAS 41, amortized cost is calculated in the currency of denomination of that financial asset. Then, the foreign currency amount is recognized using the closing rate in the entity's financial statements (paragraph 27 of IPSAS 4). That applies regardless of whether a monetary item is measured at amortized cost or fair value in the foreign currency (paragraph 28 of IPSAS 4). A non-monetary financial asset (such as an investment in an equity instrument) that is measured at fair value in the foreign currency is translated using the closing rate (paragraph 27 (c) of IPSAS 4).

As an exception, if the financial asset or financial liability is designated as a hedged item in a fair value hedge of the exposure to changes in foreign currency rates under IPSAS 41 (or IPSAS 29 if an entity chooses as its accounting policy to continue to apply the hedge accounting requirements in IPSAS 29), the hedged item is remeasured for changes in foreign currency rates even if it would otherwise have been recognized using a historical rate under IPSAS 4

(paragraph 137 of IPSAS 41 or paragraph 99 of IPSAS 29), i.e., the foreign currency amount is recognized using the closing rate. This exception applies to non-monetary items that are carried in terms of historical cost in the foreign currency and are hedged against exposure to foreign currency rates (paragraph 27(b) of IPSAS 4).

Surplus or Deficit

The recognition of a change in the carrying amount of a financial asset or financial liability in surplus or deficit depends on a number of factors, including whether it is an exchange difference or other change in carrying amount, whether it arises on a monetary item (for example, most debt instruments) or non-monetary item (such as most equity investments), whether the associated asset or liability is designated as a cash flow hedge of an exposure to changes in foreign currency rates, and whether it results from translating the financial statements of a foreign operation. The issue of recognizing changes in the carrying amount of a financial asset or financial liability held by a foreign operation is addressed in a separate question (see Question E.2.2).

Any exchange difference arising on recognizing a monetary item at a rate different from that at which it was initially recognized during the period, or recognized in previous financial statements, is recognized in surplus or deficit in accordance with IPSAS 4 (paragraph AG224 of IPSAS 41, paragraphs 32 and 37 of IPSAS 4), unless the monetary item is designated as a cash flow hedge of a highly probable forecast transaction in foreign currency, in which case the requirements for recognition of gains and losses on cash flow hedges (paragraph 140 of IPSAS 41 or paragraph 106 of IPSAS 29). Differences arising from recognizing a monetary item at a foreign currency amount different from that at which it was previously recognized are accounted for in a similar manner, since all changes in the carrying amount relating to foreign currency movements should be treated consistently. All other changes in the statement of financial position measurement of a monetary item are recognized in surplus or deficit in accordance with IPSAS 41. For example, although an entity recognizes gains and losses on financial assets measured at fair value through net assets/equity in net assets/equity (paragraphs 111 and AG225 of IPSAS 41), the entity nevertheless recognizes the changes in the carrying amount relating to changes in foreign exchange rates in surplus or deficit (paragraph 27(a) of IPSAS 4).

Any changes in the carrying amount of a non-monetary item are recognized in surplus or deficit or in net assets/equity in accordance with IPSAS 41. For example, for an investment in an equity instrument that is presented in accordance with paragraph 106 of IPSAS 41, the entire change in the carrying amount, including the effect of changes in foreign currency rates, is presented in net assets/equity (paragraph AG226 of IPSAS 41). If the non-monetary item is designated as a cash flow hedge of an unrecognized firm commitment or a highly probable forecast transaction in foreign currency, the requirements for recognition of gains and losses on cash flow hedges (paragraph 140 of IPSAS 41 or paragraph 106 of IPSAS 29).

When some portion of the change in carrying amount is recognized in net assets/equity and some portion is recognized in surplus or deficit, for example, if the amortized cost of a foreign currency bond measured at fair value through net assets/equity has increased in foreign currency (resulting in a gain in surplus or deficit) but its fair value has decreased in foreign currency (resulting in a loss recognized in net assets/equity), an entity cannot offset those two components for the purposes of determining gains or losses that should be recognized in surplus or deficit or in net assets/equity.

E.2.4—Valuation of Unquoted Equity Instruments

What valuation technique is most appropriate to apply when determining the fair value of these unquoted equity instruments?

Public sector entities have a wide range of valuation techniques available when determining the fair value of an unquoted equity instrument. IPSAS 41 does not prescribe the use of a specific valuation technique, but instead encourages the use of professional judgment and the consideration of all the facts and circumstances surrounding the section of an appropriate measurement technique. Figure 1 illustrates various valuations techniques that may be applicable based on the transactions facts and circumstances. This is not an exhaustive list.

Figure 1 – Valuation approaches and valuation techniques	
Valuation approach	Valuation techniques
Market approach	• Transaction price paid for an identical or similar instrument of an investee (see illustrative example 23) • Comparable company valuation multiples
Other approaches	• Discounted cash flow method (see illustrative example 24) • Dividend discount model • Constant growth model (see illustrative example 25) • Capitalization model • Adjusted net asset method (see illustrative example 26)

The economic characteristics of unquoted equity instruments and the information that is reasonably available to a public sector entity are two of the factors that should be considered when selecting the most appropriate valuation technique. For example, an entity is likely to place more emphasis on the comparable company valuation multiples technique when there are sufficiently comparable company peers or when the background or details of the observed transactions are known. Similarly, a public sector entity is likely to place more emphasis on the discounted cash flow method when, for example:

(a) The cash flows of a public sector entity present unique characteristics such as periods of unequal rates of growth (for example, a period of high growth that stabilizes later to more steady levels of growth).

(b) Alternatively, when measuring the fair value of unquoted equity instruments, a public sector entity might conclude that, on the basis of the specific facts and circumstances (for example, the nature of the investment, the history and stage of the development of the investment, the nature of the investment's assets and liabilities, its capital structure etc.).

(c) It is appropriate to apply the adjusted net asset method. Consequently, given specific facts and circumstances, one valuation technique might be more appropriate than another.

Some of the factors that a public sector entity will need to consider when selecting the most appropriate valuation technique(s) include (this list is not exhaustive):

1. The information that is reasonably available to a public sector entity;
2. The market conditions;
3. The investment horizon and investment type (for example, the market sentiment when measuring the fair value of a short-term financial investment might be better captured by some valuation techniques than by others);
4. some valuation techniques than by others);
5. The nature of an investment's business (for example, the volatile or cyclical nature of an investee's business might be better captured by some valuation techniques than others); and
6. The industry in which an entity operates.

The fair value measurement technique must reflect current market conditions. An entity might ensure that the valuation techniques reflect current market conditions by calibrating them at the measurement date. At initial recognition, if the transaction price represented fair value and an investor will use a valuation technique to measure fair value in

subsequent periods that uses unobservable inputs, the entity must calibrate the valuation technique so that it equals the transaction price (if the transaction contains a non-exchange component, recalibrate to the fair value of the equity instrument). The use of calibration when measuring the fair value of the unquoted equity instruments at the measurement date is a good exercise for an entity to ensure that the valuation technique reflects current market conditions and to determine whether an adjustment to the valuation technique is necessary (for example, there might be a characteristic of the instrument that is not captured by the valuation technique or a new fact that has arisen at the measurement date that was not present at initial recognition).

In some circumstances, an entity may have to apply more than one valuation technique when determining fair value.

Examples of various types of techniques for measurement of the fair value of unquoted equity instruments, are provided in Illustrative Examples 23–26.

E.2.5—Cost as a Proxy for Fair Value of Equity Instruments

Can the cost of the equity instrument be used by default for subsequent measurement?

No. Investments in equity instruments must be measured at fair value. However, as noted in paragraph AG140 cost may be an appropriate estimate of fair value because there is insufficient recent information available to measure fair value or because there is a wide range of possible fair value measurements and cost represents the best estimate of fair value within that range.

Section F Other

F.1 IPSAS 41 and IPSAS 2—Hedge Accounting: Cash Flow Statement

How should cash flows arising from hedging instruments be classified in the cash flow statement?

Cash flows arising from hedging instruments are classified as operating, investing or financing activities, on the basis of the classification of the cash flows arising from the hedged item. While the terminology in IPSAS 2 has not been updated to reflect IPSAS 41, the classification of cash flows arising from hedging instruments in the cash flow statement should be consistent with the classification of these instruments as hedging instruments under IPSAS 41.

Section G Concessionary Loans and Non-Exchange Equity Transactions

G.1 Sequencing of "Solely Payments of Principal and Interest" Evaluation for a Concessionary Loan

If an entity issues a concessionary loan (financial asset), when does it assess classification for subsequent measurement purposes?

An entity firstly assesses whether the substance of the concessionary loan is in fact a loan, a transfer, a contribution from owners or a combination thereof, by applying the principles in IPSAS 28 and paragraphs AG152–AG153 of IPSAS 47, *Revenue*. If an entity has determined that the transaction, or part of the transaction, is a loan, it assesses whether the transaction consideration represents the fair value of the loan on initial recognition. An entity determines the fair value of the loan by using the principles in paragraphs AG144–AG155.

After initial recognition at fair value, an entity subsequently assesses the classification of concessionary loans in accordance with paragraphs 39–44 and measures concessionary loans in accordance with paragraphs 61–65.

G.2 Concessionary Loans and "Solely Payments of Principal and Interest" Evaluation

Can a concessionary loan satisfy the SPPI condition?

Yes. When the payments of the loan, based on its fair value determined at initial recognition, reflect solely payments of principal and interest.

However, if a financial asset contains a contractual term that could change the timing or amount of contractual cash flows (for example, a contingent repayment feature specific to the borrower), the entity must determine whether the

contractual cash flows that could arise over the life of the instrument due to that contractual term are solely payments of principal and interest on the principal amount outstanding. If the terms of the financial asset give rise to any other cash flows or limit the cash flows in a manner inconsistent with payments representing principal and interest, the financial asset does not meet the condition in paragraphs 40(b) and 41(b). To make this determination, the entity must assess the contractual cash flows that could arise both before, and after, the change in contractual cash flows. The entity may also need to assess the nature of any contingent event (i.e., the trigger) that would change the timing or amount of the contractual cash flows (see paragraphs AG72–AG75).

A common feature of a concessionary loan is an interest concession. A concessionary loan with a contractual interest rate of nil does not preclude the instrument from satisfying the SPPI condition.

G.3 Valuation of Non-Exchange Component

Can the non-exchange component of an equity transaction equal the transaction cost?

No. To the extent an entity receives an equity instrument, such as common shares, in exchange for consideration, the equity instrument will have some value on initial recognition and must be measured at fair value.

At initial recognition, the entity must evaluate the substance of the arrangement and assess whether a portion of the consideration provided is a non-exchange component such as a grant or subsidy.

G.4 Equity Instruments Arising from Non-Exchange Transactions

How might an equity instrument included in a non-exchange transaction be evidenced?

In assessing whether an equity instrument is included as part of a transaction that also includes a non-exchange component, an entity applies the definition of an equity instrument and the requirements in IPSAS 28.

Indicators that may evidence the existence of an equity instrument may include:

(a) A formal designation of the transfer (or a class of such transfers) of equity instruments forming part of the investment's contributed net assets/equity, either before the investment occurs or at the time of the investment;

(b) A formal agreement, in relation to the equity instrument, establishing or increasing an existing financial interest in the net assets/equity of the investment that can be sold, transferred, or redeemed; or

(c) The receipt of equity instruments that can be sold, transferred, or redeemed.

G.5 Factors to Consider in Evaluating Concessionary and Originated Credit-Impaired Loans

What factors should be considered when evaluating whether a loan is a concessionary loan or an originated credit-impaired loan?

Both concessionary loans and originated credit-impaired loans have lower estimated future cash flows than similar loans that do not have a concessionary or credit-impaired component.

The issuer of a debt instrument evaluates the substance of the financial instrument to determine whether the instrument is classified as a concessionary loan or an originated credit-impaired loan.

Features that indicate that the financial instrument is a concessionary loan include:

- The lender has an objective to incorporate a non-exchange component in the loan transaction. As such, the lender intends to give up a portion of the cash flows that would otherwise be available had the transaction been negotiated at market terms;
- The financial instrument is extended below-market terms, by way of an interest and/or a principal concession; and

- The characteristics of the loan agreement, i.e., the contractual terms that are negotiated off market, result in a decrease in the estimated future cash flows of the instrument when compared to a similar loan that does not have a concessionary or credit-impaired component.

Originated credit-impaired financial assets (see paragraphs 85–86) are generally extended at market terms at origination but have lower estimated cash flows in comparison to similar instruments, because the borrowing entity is not expected to be able to satisfy the contractual terms of the arrangement. The lender expects a portion of the contractual cash flows to be uncollectible, as opposed to intending to give up a portion of the cash flows which would otherwise be available at market terms. As such, originated credit-impaired loans present an opportunity for the lender to collect cash flows in excess of the estimated future cash flows, while with concessionary loans, the estimated future cash flows approximate the contractual cash flows, meaning no additional cash flows are available.

G.6 Concessionary Loans that are Originated Credit-Impaired

Can a concessionary loan be originated credit-impaired?

Yes. In some circumstances a concessionary loan may be granted that is also originated credit-impaired. A concessionary loan may be credit-impaired at origination because one or more events have had a detrimental impact on the estimated future cash flows of the financial asset.

For example, in order to support the operation of the national airline's domestic routes, the department of finance advances loans to the airline on an annual basis. The annual interest payments are based on a contract rate of 6 percent. Assuming the market rate at the time the loan is advanced is 10 percent, this represents a concession.

Historically, even with the concessionary terms, the department of finance has collected only 85 percent of the loan's contractual cash flows. The department of finance expects this trend to continue with the current loan issue.

This example represents a concessionary originated credit-impaired loan as the loan has concessionary terms, but even with those terms, significant credit losses are expected to occur.

In evaluating whether the expected credit losses on the concessionary loan support the loan being originated credit-impaired or just represent normal credit losses, the entity considers whether one or more events has occurred that have had a detrimental impact on the estimated future cash flows of the loan.

Section H Effective Interest Method

H.1 Requirement to Use the Effective Interest Method

When transaction costs and any premium or discount on issuance are insignificant, measuring the amortized cost of an instrument using the effective interest rate produces similar results as using the straight-line method.

In circumstances where measuring the gross amount of an instrument using the effective interest method yields immaterial differences as compared to applying the straight-line method, is the effective interest method required to be used?

Measuring the amortized cost of an instrument requires the use of the effective interest method. However, in practice there may be scenarios where applying the straight-line method yields materially the same result.

Paragraph 10 of IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*, indicates "IPSAS set out accounting policies that the IPSASB has concluded result in financial statements containing relevant and faithfully representative information about the transactions, other events, and conditions to which they apply. Those policies need not be applied when the effect of applying them is immaterial…"

When an alternative technique – in this case the straight-line method – yields materially the same result as measuring amortized cost using the effective interest method, management need not apply the effective interest method as required by IPSAS 41, *Financial Instruments*.

The following example illustrates why differences arise when measuring the gross amount of a debt instrument using the effective interest method compared to the straight-line method. National Government A issues a bond with a face value of CU100,000. The bond yield of 10 percent is paid annually until maturity in 5 years. The bond was issued at a discount of 3 percent and National Government A had to pay CU2,000 in transaction costs.

Under both measurement methodologies, National Government A received CU95,000 on issuance of the instrument (CU95,000 = CU100,000 – CU2,000 – CU100,000 x 3 percent).

Straight Line Method

Measuring the gross amount of the instrument using the straight line method requires amortizing the discount and transaction costs evenly until maturity.

Year	**(a)**	**(b = 100,000 × 10 percent)**	**(c)**	**(d)**	**(e = a + b + c – d)**
	Gross carrying amount at the beginning of the year	**Interest expense**	**Amortization of transaction costs and discount**	**Cash flows**	**Gross carrying amount at the end of the year**
1	95,000	10,000	1,000	10,000	96,000
2	96,000	10,000	1,000	10,000	97,000
3	97,000	10,000	1,000	10,000	98,000
4	98,000	10,000	1,000	10,000	99,000
5	99,000	10,000	1,000	110,000	–

Effective Interest Method

Measuring the gross amount of the instrument using the effective interest method requires calculating the rate that exactly discounts the estimate future cash payments through the expected life of the instrument to the gross carrying amount of the instrument. Discounting the estimated cash flows of the bond yields an effective interest rate of 11.37 percent.

Year	**(a)**	**(b = a × 11.37 percent)**	**(c)**	**(d = a + b – c)**
	Gross carrying amount at the beginning of the year	**Interest expense**	**Cash flows**	**Gross carrying amount at the end of the year**
1	95,000	10,797	10,000	95,797
2	95,797	10,888	10,000	96,685
3	96,685	10,989	10,000	97,673
4	97,673	11,101	10,000	98,774

Year	(a)	(b = a × 11.37 percent)	(c)	(d = a + b – c)
	Gross carrying amount at the beginning of the year	Interest expense	Cash flows	Gross carrying amount at the end of the year
5	98,774	11,226	110,000	–

When evaluating whether measuring the gross amount of the bond using the straight line method yields an immaterial difference compared to applying the effective interest method, the gross amount is compared at each measurement date as detailed in the table below.

Year	Straight Line Method	Effective Interest Method	
	Gross carrying amount at the beginning of the year	Gross carrying amount at the beginning of the year	Difference
1	95,000	95,000	-
2	96,000	95,797	203
3	97,000	96,685	315
4	98,000	97,673	327
5	99,000	98,774	226

The measurement difference between the two methods is a result of the transaction costs and the discount on issuance of the bond. As the costs approach zero, the difference between measuring the bond using the straight line method or the effective interest method will become smaller. As the costs increase, the difference will grow in size.

Furthermore, contemplating the effect on annual interest expense may yield further considerations when assessing whether applying the straight line method or effective interest method is material.

Section I Sovereign Debt Restructurings

I.1 Sovereign Debt Restructurings

Are sovereign debt restructurings covered by IPSAS 41?

Yes. Sovereign debt restructurings involve the modification, and/or derecognition, of financial liabilities, which are addressed in IPSAS 41. The requirements and guidance relevant to sovereign debt restructurings include:

(a) Paragraphs 57 and 64 establish the requirements for the initial, and subsequent, measurement of financial liabilities;

(b) Paragraphs 35–38 establish the derecognition requirements for financial liabilities;

(c) Paragraph AG46 provides application guidance for assessing the extent of modifications to financial liabilities; and

(d) Paragraphs AG118–AG127 provide application guidance for loans granted at concessionary terms.

COMPARISON WITH IFRS 9

IPSAS 41, *Financial Instruments* is drawn primarily from IFRS 9, *Financial Instruments* (including amendments up to December 31, 2015). The main differences between IPSAS 41 and IFRS 9 are as follows:

- IPSAS 41 contains additional application guidance to deal with concessionary loans, financial guarantee contracts entered into at nil or nominal consideration, equity instruments arising from non-exchange transactions and fair value measurement.
- In certain instances, IPSAS 41 uses different terminology from IFRS 9. The most significant examples are the use of the terms “statement of financial performance” and “net assets/equity.” The equivalent terms in IFRS 9 are “statement of comprehensive income or separate income statement (if presented)” and “equity.”
- IPSAS 41 does not distinguish between “revenue” and “income.” IFRS 9 distinguishes between “revenue” and “income,” with “income” having a broader meaning than the term “revenue.”
- Principles from IFRIC 16, *Hedges of a Net Investment in a Foreign Operation* and IFRIC 19, *Extinguishing Financial Liabilities with Equity Instruments* have been included as authoritative appendices to IPSAS 41. The IASB issues IFRICs as separate documents.
- IPSAS 41 includes additional fair value measurement guidance retained from IPSAS 29, *Financial Instruments: Recognition and Measurement*.

IPSAS 42, *SOCIAL BENEFITS*

History of IPSAS Accounting Standard

This version includes amendments resulting from IPSAS Accounting Standards issued up to January 31, 2026.

IPSAS 42, *Social Benefits* was issued in January 2019.

Since then, IPSAS 42 has been amended by the following IPSAS Accounting Standards:

- IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards* (issued November 2025)
- *Definition of Material* (Amendments to IPSAS 1, IPSAS 3, and the Conceptual Framework) (issued October 2025)
- IPSAS 48, *Transfer Expenses* (issued May 2023)
- IPSAS 46, *Measurement* (issued May 2023)
- *COVID-19: Deferral of Effective Dates* (*i*ssued November 2020)
- *Collective and Individual Services* (Amendments to IPSAS 19) (issued January 2020)

Table of Amended Paragraphs in IPSAS 42

Paragraph Affected	How Affected	Affected By
12	Amended	IPSAS 46 May 2023
4A	New	*Collective and Individual Services* January 2020
35	Amended	*COVID-19: Deferral of Effective Dates* November 2020
35A	Amended	*COVID-19: Deferral of Effective Dates* November 2020

Comparison with GFS	

International Public Sector Accounting Standard 42, *Social Benefits*, is set out in paragraphs 1–36. All the paragraphs have equal authority. IPSAS 42 should be read in the context of its objective, the Basis for Conclusions, the *Preface to IPSAS Accounting Standards and IPSASB SRS Standards*, and *The Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities*. IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*, provides a basis for selecting and applying accounting policies in the absence of explicit guidance.

Objective

1. The objective of this Standard is to improve the relevance, faithful representativeness and comparability of the information that a reporting entity provides in its financial statements about social benefits as defined in this Standard. The information provided should help users of the financial statements and general purpose financial reports assess:

   (a) The nature of such social benefits provided by the entity;

   (b) The key features of the operation of those social benefit schemes; and

   (c) The impact of such social benefits provided on the entity's financial performance, financial position and cash flows.

2. To accomplish that, this IPSAS establishes principles and requirements for:

   (a) Recognizing expenses and liabilities for social benefits;

   (b) Measuring expenses and liabilities for social benefits;

   (c) Presenting information about social benefits in the financial statements; and

   (d) Determining what information to disclose to enable users of the financial statements to evaluate the nature and financial effects of the social benefits provided by the reporting entity.

Scope

3. **An entity that prepares and presents financial statements under the accrual basis of accounting shall apply this Standard in accounting for social benefits.**

4. **This Standard applies to a transaction that meets the definition of a social benefit. This Standard does not apply to cash transfers that are accounted for in accordance with other Standards:**

   (a) **Financial instruments that are within the scope of IPSAS 41, *Financial Instruments* (or IPSAS 29, *Financial Instruments: Recognition and Measurement* prior to an entity adopting IPSAS 41);**

   (b) **Employee benefits that are within the scope of IPSAS 39, *Employee Benefits;* and**

   (c) **Insurance contracts that are within the scope of the relevant international or national accounting standard dealing with insurance contracts.**

   Paragraphs AG1–AG3 provide additional guidance on the scope of this Standard.

4A. Collective services and individual services (as defined in IPSAS 19, *Provisions, Contingent Liabilities and Contingent Assets*) are not social benefits. Guidance on determining whether a provision arises for these transactions is provided in IPSAS 19.

Definitions

5. **The following terms are used in this Standard with the meanings specified:**

   Social benefits are cash transfers provided to:

   (a) **Specific individuals and/or households who meet eligibility criteria;**

   (b) **Mitigate the effect of social risks; and**

   (c) **Address the needs of society as a whole.**

   Paragraphs AG4–AG8 provide additional guidance on this definition.

   Social risks are events or circumstances that:

(a) **Relate to the characteristics of individuals and/or households – for example, age, health, poverty and employment status; and**

(b) **May adversely affect the welfare of individuals and/or households, either by imposing additional demands on their resources or by reducing their income.**

Paragraphs AG9–AG10 provide additional guidance on what is encompassed by social risks.

General Approach

Recognition of a Liability for a Social Benefit Scheme

6. **An entity shall recognize a liability for a social benefit scheme when:**

(a) **The entity has a present obligation for an outflow of resources that results from a past event; and**

(b) **The present obligation can be measured in a way that achieves the qualitative characteristics and takes account of constraints on information in general purpose financial reports as set out in *the Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities*.**

Outflow of Resources

7. A liability must involve an outflow of resources from the entity for it to be settled. An obligation that can be settled without an outflow of resources from the entity is not a liability.

8. There may be uncertainty associated with the measurement of the liability. The use of estimates is an essential part of the accrual basis of accounting. Uncertainty regarding the outflow of resources does not prevent the recognition of a liability unless the level of uncertainty is so large that the qualitative characteristics of relevance and faithful representativeness cannot be met. Where the level of uncertainty does not prevent the recognition of a liability, it is taken into account when measuring the liability.

Past Event

9. The past event that gives rise to a liability for a social benefit scheme is the satisfaction by each beneficiary of all eligibility criteria to receive a social benefit payment. The satisfaction of eligibility criteria for each social benefit payment is a separate past event.

Paragraphs AG11–AG14 provide additional guidance on the recognition of a liability.

Recognition of an Expense for a Social Benefit Scheme

10. **An entity shall recognize an expense for a social benefit scheme at the same point that it recognizes a liability.**

11. An entity shall not recognize an expense for a social benefit scheme where a social benefit payment is made prior to all eligibility criteria for the next payment being satisfied. Rather, an entity shall recognize a payment in advance as an asset in the statement of financial position, unless the amount becomes irrecoverable, in which case it shall recognize an expense.

Measurement of a Liability for a Social Benefit Scheme

Initial Measurement of the Liability

12. **An entity shall measure the liability for a social benefit scheme at the best estimate of the costs (i.e., the social benefit payments) that the entity will incur in fulfilling the present obligations represented by the liability. IPSAS 46, *Measurement*, provides guidance on measuring liabilities at cost of fulfillment.**

13. An entity's best estimate of the costs (i.e., the social benefit payments) that the entity will make takes into account the possible effect of subsequent events on those social benefit payments.

14. When the liability in respect of a social benefit scheme is not expected to be settled before twelve months after the end of the reporting period in which the liability is recognized (i.e., the next social benefit payment will not be made for more than twelve months), the liability shall be discounted using the discount rate specified in paragraph 19.

15. Paragraphs AG15–AG18 provide additional guidance on measuring the liability.

Subsequent Measurement

16. **The liability for a social benefit scheme shall be reduced as social benefit payments are made. Any difference between the cost of making the social benefit payments and the carrying amount of the liability in respect of the social benefit scheme is recognized in surplus or deficit in the period in which the liability is settled.**

17. **Where a liability is discounted in accordance with paragraph 14, the liability is increased and interest expense recognized in each reporting period until the liability is settled, to reflect the unwinding of the discount.**

18. **Where a liability has yet to be settled, the liability shall be reviewed at each reporting date, and adjusted to reflect the current best estimate of the costs (i.e., the social benefit payments) that the entity will incur in fulfilling the present obligations represented by the liability.**

Discount Rate

19. **The rate used to discount a liability in respect of a social benefit scheme shall reflect the time value of money. The currency and term of the financial instrument selected to reflect the time value of money shall be consistent with the currency and estimated term of the social benefit liability.**

20. Paragraph AG18 provides additional guidance on the discount rate to be used.

Measurement of an Expense for a Social Benefit Scheme

21. **An entity shall initially measure the expense for a social benefit scheme at an amount equivalent to the amount of the liability measured in accordance with paragraph 12. Where the entity makes a social benefit payment prior to all eligibility criteria for the next payment being satisfied, it shall measure the payment in advance or expense recognized in accordance with paragraph 11 at the amount of the cash transferred.**

Disclosure

22. **The objective of the disclosures under the general approach, together with the information provided in the statement of financial position, statement of financial performance, statement of changes in net assets/equity and statement of cash flows, is for entities to give users of the financial statements a basis to assess the effect that social benefits may have on the financial position, financial performance and cash flows of the entity. Paragraphs 23–25 specify requirements on how to meet this objective.**

23. **An entity shall disclose information that:**

    (a) **Explains the characteristics of its social benefit schemes; and**

    (b) **Explains the demographic, economic and other external factors that may affect its social benefit schemes.**

24. To meet the requirements of paragraph 23, an entity shall disclose:

(a) Information about the characteristics of its social benefit schemes, including:

(i) The nature of the social benefits provided by the schemes (for example, retirement benefits, unemployment benefits, child benefits).

(ii) Key features of the social benefit schemes, such as a description of the legislative framework governing the schemes, a summary of the main eligibility criteria that must be satisfied to receive the social benefits, and a statement about how additional information about the scheme can be obtained.

(iii) A description of how the schemes are funded, including whether the funding for the schemes is provided by means of a budget appropriation, a transfer from another public sector entity, or by other means. If a scheme is funded (whether in full or in part) by social contributions, the entity shall provide:

a. A cross reference to the location of information about those social contributions and any dedicated assets (where this information is included in the entity's financial statements); or

b. A statement regarding the availability of information on those social contributions and any dedicated assets in another entity's financial statements and how that information can be obtained.

(iv) A description of the key demographic, economic and other external factors that influence the level of expenditure under the social benefit schemes. This description may be presented in aggregate where the same demographic, economic and other external factors impact a number of social benefit schemes in a similar manner.

(b) The total expenditure on social benefits recognized in the statement of financial performance, analyzed by social benefit scheme.

(c) A description of any significant amendments to the social benefit schemes made during the reporting period, along with a description of the expected effect of the amendments. Amendments to a social benefit scheme include, but are not limited to:

(i) Changes to the level of social benefits provided; and

(ii) Changes to the eligibility criteria, including the individuals and/or households covered by the social benefit scheme.

In making the disclosures required by this paragraph, an entity shall have regard to the requirements of paragraphs 45–47 of IPSAS 1, *Presentation of Financial Statements*, which provide guidance on materiality and aggregation.

25. If a social benefit scheme satisfies the criteria in paragraph 28 to permit the use of the insurance approach, a statement to that effect.

Insurance Approach

Recognition and Measurement

26. **Where a social benefit scheme satisfies the criteria in paragraph 28, an entity is permitted, but not required, to recognize and measure the assets, liabilities, revenue and expenses associated with that social benefit scheme by applying, by analogy, the requirements of the relevant international or national accounting standard dealing with insurance contracts[1].**

[1] In the insurance approach section of this Standard, the term "the relevant international or national accounting standard dealing with insurance contracts" refers to IFRS 17, *Insurance Contracts* and national standards that have adopted substantially the same principles as IFRS 17.

Paragraph AG19 provides additional guidance on the accounting standards dealing with insurance contracts that may be applied, by analogy, in accounting for social benefits.

27. Where an entity elects not to apply by analogy the requirements of the relevant international or national accounting standard dealing with insurance contracts, the entity shall recognize and measure the liabilities and expenses associated with that social benefit scheme, and include disclosures in the financial statements, in accordance with paragraphs 6–25 of this Standard.

28. An entity may recognize and measure the assets, liabilities, revenue and expenses associated with a social benefit scheme by applying, by analogy, the requirements of the relevant international or national accounting standard dealing with insurance contracts where:

    (a) The social benefit scheme is intended to be fully funded from contributions; and

    (b) There is evidence that the entity manages the scheme in the same way as an issuer of insurance contracts, including assessing the financial performance and financial position of the scheme on a regular basis.

    Paragraphs AG20–AG25 provide additional guidance on determining whether these criteria have been satisfied.

Disclosure

29. **The objective of the disclosures under the insurance approach, together with the information provided in the statement of financial position, statement of financial performance, statement of changes in net assets/equity and statement of cash flows, is for entities to give users of the financial statements a basis to assess the effect that social benefits may have on the financial position, financial performance and cash flows of the entity. Paragraphs 30 and 31 specify requirements on how to meet this objective.**

30. **Where an entity recognizes and measures the assets, liabilities, revenue and expenses associated with a social benefit scheme by applying, by analogy, the requirements of the relevant international or national accounting standard dealing with insurance contracts, the entity shall disclose:**

    (a) **The basis for determining that the insurance approach is appropriate;**

    (b) **The information required by the relevant international or national accounting standard dealing with insurance contracts; and**

    (c) **Any additional information required by paragraph 31 of this Standard.**

31. To meet the requirements of paragraph 30(c) of this Standard, an entity shall disclose:

    (a) Information about the characteristics of its social benefit schemes, including:

        (i) The nature of the social benefits provided by the schemes (for example, retirement benefits, unemployment benefits, child benefits); and

        (ii) Key features of the social benefit schemes, such as a description of the legislative framework governing the scheme, a summary of the main eligibility criteria that must be satisfied to receive the social benefit, and a statement about how additional information about the scheme can be obtained; and

    (b) A description of any significant amendments to the social benefit schemes made during the reporting period, along with a description of the expected effect of the amendments. Amendments to a social benefit scheme include, but are not limited to:

        (i) Changes to the level of social benefits provided; and

        (ii) Changes to the eligibility criteria, including the individuals and/or households covered by the social benefit scheme.

In making the disclosures required by this paragraph, an entity shall have regard to the requirements of paragraphs 45–47 of IPSAS 1, which provide guidance on materiality and aggregation.

Reporting on the Long-Term Sustainability of an Entity's Finances

32. Entities with social benefits are encouraged, but not required, to prepare general purpose financial reports that provide information on the long-term sustainability of the entity's finances. Recommended Practice Guideline (RPG) 1, *Reporting on the Long-Term Sustainability of an Entity's Finances*, provides guidance on the preparation of such reports.

Transitional Provisions

General Approach

33. **In accounting for a social benefit scheme that is recognized and measured, and about which disclosures are made, in accordance with the general approach (see paragraphs 6–25), an entity shall apply this Standard retrospectively, in accordance with IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors.***

Insurance Approach

34. **An entity shall apply the transitional provisions in the relevant international or national accounting standard dealing with insurance contracts in accounting for a social benefit scheme that is recognized and measured, and about which disclosures are made, in accordance with the insurance approach (see paragraphs 26–31).**

Effective Date

35. **An entity shall apply this Standard for annual financial statements covering periods beginning on or after January 1, 2023. Earlier application is encouraged. If an entity applies this Standard for a period beginning before January 1, 2023, it shall disclose that fact.**

35A. **Paragraph 4A was added by *Collective and Individual Services* (Amendments to IPSAS 19). An entity shall apply this amendment for annual financial statements covering periods beginning on or after January 1, 2023. Earlier application is encouraged.**

35B. **Paragraphs 12 and AG17 were amended by IPSAS 46, *Measurement*, issued in May 2023. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2025. Earlier application is encouraged. If an entity applies the amendment for a period beginning before January 1, 2025, it shall disclose that fact and apply IPSAS 46 at the same time.**

36. When an entity adopts accrual basis IPSAS Standards as defined in IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards* for financial reporting purposes subsequent to this effective date, this Standard applies to the entity's annual financial statements covering periods beginning on or after the date of adoption of IPSAS Standards.

Appendix A

Application Guidance

This Appendix is an integral part of IPSAS 42.

Scope (see paragraphs 3–4)

AG1. This Standard is applied in accounting for transactions and obligations that meet the definition of a social benefit in paragraph 5 of this Standard. This Standard does not address transactions that are addressed in other IPSAS, such as employee pensions (which are accounted for in accordance with IPSAS 39, *Employee Benefits)* and concessionary loans such as student loans (which are accounted for in accordance with IPSAS 41, *Financial Instruments* (or IPSAS 29, *Financial Instruments: Recognition and Measurement* prior to an entity adopting IPSAS 41)).

AG2. Similarly, this Standard does not apply to insurance contracts, even if the risk covered by the insurance contract is a social risk as defined in paragraph 5 of this Standard. Insurance contracts are accounted for in accordance with the relevant international or national accounting standard dealing with insurance contracts.

AG3. This Standard does not apply to collective and individual services. The definition of social benefits only includes cash transfers, not the provision of services. This Standard does not apply to cash transfers to individuals and households that do not address social risks, for example emergency relief.

Definitions (see paragraph 5)

Guidance on the Definition of Social Benefits

AG4. Social benefits are cash transfers (including transfers in the form of cash equivalents, for example pre-paid debit cards) provided to individuals and/or households. Services provided by a public sector entity are not social benefits. In some jurisdictions, a public sector entity may provide vouchers that allow individuals and/or households to access services, or may reimburse individuals and/or households for costs incurred in accessing services. The economic substance of these transactions is that the public sector entity is paying for the provision of the services; such transactions do not, therefore, meet the definition of a social benefit. Where a public sector entity provides vouchers or reimbursements, the individual and/or household has no discretion over the use of the benefit. By contrast, social benefits provide cash transfers that may be used indistinguishably from income coming from other sources.

AG5. Some jurisdictions may provide cash transfers in the form of cash equivalents that have limited restrictions on the use of the cash transfer. For example, a government may provide a pre-paid debit card that can be used to purchase any item except alcohol and tobacco products. Such limited restrictions do not contravene the principle that social benefits provide cash transfers that may be used indistinguishably from income coming from other sources. Pre-paid debit cards with limited restrictions are cash transfers, not the provision of services by a government.

AG6. Social benefits are only provided when eligibility criteria to receive a social benefit payment when it is next paid are met. For example, a government may provide unemployment benefits to ensure that the needs of those whose income during periods of unemployment would otherwise be insufficient are met. Although the unemployment benefit scheme potentially covers the population as a whole, unemployment benefits are only paid to those who are unemployed, i.e. those who meet the eligibility criteria. In some cases, eligibility criteria may relate to citizenship or residence, for example where a public sector entity pays a universal basic income to all adult residents.

AG7. The assessment of whether a benefit is provided to mitigate the effect of social risks is made by reference to society as a whole; the benefit does not need to mitigate the effect of social risks for each recipient. An example

is where a government pays a retirement pension to all those over a certain age, regardless of income or wealth, to ensure that the needs of those whose income after retirement would otherwise be insufficient are met. Such benefits satisfy the definition criteria that they are provided to mitigate the effect of social risks.

AG8. Social benefits are organized to ensure that the needs of society as a whole are addressed. This distinguishes them from benefits provided through insurance contracts, which are organized for the benefit of individuals, or groups of individuals. Addressing the needs of society as a whole does not require that each social benefit covers all members of society; in some jurisdictions, social benefits are provided through a range of similar benefits that cover different segments of society. A social benefit that covers a segment of society as part of a wider system of social benefits meets the requirement that it addresses the needs of society as a whole.

Guidance on the Definition of Social Risks

AG9. Social risks relate to the characteristics of individuals and/or households–for example, age, health, poverty and employment status. The nature of a social risk is that it relates directly to the characteristics of an individual and/or household. The condition, event, or circumstance that leads to or contributes to an unplanned or undesired event arises from the characteristics of the individuals and/or households. This distinguishes social risks from other risks, where the condition, event, or circumstance that leads to or contributes to an unplanned or undesired event arises from something other than the characteristics of an individual or household.

AG10. For example, unemployment benefits are social benefits because the condition, event, or circumstance covered by the unemployment benefit arises from characteristics of the individuals and/or households – in this case a change in an individual's employment status. By contrast, aid provided immediately following an earthquake is not a social benefit. The condition, event, or circumstance that leads to or contributes to an unplanned or undesired event is an active fault line, and the risk is that a possible earthquake causes damage. Because the risk relates to geography rather than individuals and/or households, this risk is not a social risk.

General Approach (see paragraphs 6–21)

Recognition of a Liability for a Social Benefit Scheme

AG11. In accordance with paragraph 9 of this Standard, the past event that gives rise to a liability for a social benefit scheme is the satisfaction by each beneficiary of all eligibility criteria to receive a social benefit payment. Being alive at the point at which the eligibility criteria are required to be satisfied may be an eligibility criterion, whether explicitly stated or implicit. Other ongoing eligibility criteria may be relevant for some social benefit schemes. For example, many unemployment benefits are only payable while the individual remains resident in the jurisdiction; residence is an ongoing eligibility criterion. For a liability to be recognized, a beneficiary must satisfy the eligibility criteria (to receive a social benefit payment) at, or prior to, the reporting date, even if formal validation of the eligibility criteria occurs less frequently.

AG12. Where a beneficiary has not previously satisfied the eligibility criteria for the next payment, or there has been a break in satisfying the eligibility criteria, a liability is recognized at the point that the eligibility criteria for the next payment are first satisfied or when all the eligibility criteria are satisfied again. Examples may include:

(a) Reaching retirement age (in the case of a retirement pension);

(b) The death of a partner (in the case of a survivor benefit);

(c) Becoming unemployed (in the case of an unemployment benefit without a waiting period); and

(d) Being unemployed for a specified period (in the case of an unemployment benefit with a waiting period).

An entity will recognize a liability where beneficiaries satisfy the eligibility criteria (to receive a social benefit payment) at, or prior to, the reporting date. Where a beneficiary satisfies the eligibility criteria for a social benefit

payment prior to the point at which the next social benefit payment will be made, but after the reporting date, no liability is recognized, as there is no present obligation as at the reporting date.

AG13. Where a beneficiary has previously satisfied the eligibility criteria, and there has been no break in satisfying those criteria, a liability for social benefits is recognized each time the criteria are satisfied.

AG14. Whether being alive is a separate eligibility criterion will depend on the characteristics of each individual social benefit scheme. For some schemes, separate consideration of being alive is not required as it is indirectly addressed by another eligibility criterion. For example:

(a) An unemployment benefit may only be payable to those who have become unemployed and are available for work (which implicitly includes being alive).

(b) Being alive may not be an eligibility criterion for the recipient of the social benefit. A child benefit may be paid to the parents or guardian of the child; the payment of the benefit may be dependent on the child being alive, and not on the status of the parent or guardian.

(c) Benefits may be transferred to a survivor following the death of the beneficiary.

An entity needs to consider how being alive affects the recognition of each particular social benefit scheme, taking all relevant factors into consideration.

Measurement of a Liability for a Social Benefit Scheme

AG15. In accordance with paragraph 12 of this Standard, an entity shall measure the liability for a social benefit scheme at the best estimate of the costs (i.e., the social benefit payments) that the entity expects to make in fulfilling the present obligation represented by the liability. Satisfaction of the eligibility criteria for each social benefit payment is a separate past event, and the liability for each payment is measured separately. The maximum amount to be recognized as a liability is the costs the entity expects to incur in making the next social benefit payment. This is because social benefit payments beyond this point are future events for which there is no present obligation.

AG16. In measuring the liability, an entity takes into account the possibility that beneficiaries may cease to be eligible for the social benefit prior to the next point at which eligibility criteria for the next payment are required (implicitly or explicitly) to be satisfied. Examples include:

(a) The death of the beneficiary (where no survivor benefits are payable);

(b) Commencing employment (in the case of an unemployment benefit); and

(c) Exceeding the maximum period for which a social benefit is provided (where an unemployment benefit is provided for a limited period).

The extent to which such events affect the measurement of the liability will depend on the terms of the scheme. For example, an unemployment benefit is payable on the 15th of each month, and the reporting date is December 31. If the payment to be made on January 15 relates to unemployment up to December 15, then at the time the eligibility criteria for the next social benefit payment are met, the amount due will be known and is recognized at the reporting date. No adjustment for beneficiaries subsequently ceasing to be eligible is required.

However, if the payment on January 15 relates to unemployment between December 16 and January 15, measurement of the liability to be recognized at the reporting date is based on an estimate of the extent to which eligibility criteria for a payment have been satisfied.

AG17. Because a liability cannot extend beyond the point at which eligibility criteria for the next payment will be next satisfied, liabilities in respect of social benefits will usually be short-term liabilities. Consequently, prior to the financial statements being authorized for issue, an entity may receive information regarding the eligibility of beneficiaries to receive the social benefit. IPSAS 14, *Events After the Reporting Date*, and Appendix C of IPSAS 46, *Measurement*, provides guidance on using this information.

AG18. Because a liability for a social benefit scheme will usually be a short-term liability, the time value of money may not be material. Nevertheless, this Standard requires an entity to discount the liability in those cases where the liability is not expected to be settled within twelve months of the reporting date and the impact of discounting is material. IPSAS 39 provides additional guidance on the discount rate to be used.

Insurance Approach (see paragraphs 26–28)

AG19. In the insurance approach section of this Standard, the term "the relevant international or national accounting standard dealing with insurance contracts" refers to IFRS 17, *Insurance Contracts*, and national standards that have adopted substantially the same principles as IFRS 17. IFRS 17 has adopted principles for accounting for insurance contracts that, when applied by analogy to social benefit schemes that satisfy the criteria to use the insurance approach, will provide information that meets users' needs and satisfies the qualitative characteristics. This may not be the case for other accounting standards dealing with insurance contracts. For example, the IASB has described IFRS 4, *Insurance Contracts,* as an "interim Standard that permits a wide range of practices and includes a "temporary exemption", which explicitly states that an entity does not need to ensure that its accounting policies are relevant to the economic decision-making needs of users of financial statements, or that those accounting policies are reliable."[2] IFRS 4, and national standards that are consistent with the principles of IFRS 4, may not provide information that meets users' needs and satisfies the qualitative characteristics. Consequently, an entity may not recognize and measure the assets, liabilities, revenue and expenses associated with a social benefit scheme by applying, by analogy, the requirements of standards that have not adopted substantially the same principles as IFRS 17.

Guidance on Determining Whether a Social Benefit Scheme is Intended to be Fully Funded from Contributions

AG20. A social benefit scheme is intended to be fully funded from contributions when:

(a) The legislation or other arrangement governing the social benefit scheme provides for the scheme to be funded by contributions or levies paid by or on behalf of either the potential beneficiaries or those whose activities create or exacerbate the social risks which are mitigated by the social benefit scheme, together with investment returns arising from the contributions or levies; and

(b) One or both of the following indicators (individually or in combination) is satisfied:

(i) Contribution rates or levy rates are reviewed (and, where appropriate, adjusted in line with the scheme's funding policy), either on a regular basis or when specified criteria are met, with the aim of ensuring that the revenue from contributions or levies will be sufficient to fully fund the social benefit scheme; and/or

(ii) Social benefit levels are reviewed (and, where appropriate, adjusted in line with the scheme's funding policy), either on a regular basis or when specified criteria are met, with the aim of ensuring that the levels of social benefits provided will not exceed the level of funding available from contributions or levies.

In subparagraphs (i) and (ii) above, reviews are undertaken on a regular basis when they are performed at a frequency appropriate for the specific scheme. While annual reviews are common, less frequent—or more frequent—reviews will be appropriate for some schemes.

AG21. In some circumstances, a public sector entity may be required to make contributions to a social benefit scheme on behalf of those individuals and/or households who could not afford to do so. Such contributions may be made by the entity administering the scheme or some other entity. For example, a public sector entity may be required to make contributions to a retirement pension scheme for those individuals who are unemployed. Where the

[2] Exposure Draft ED/2013/7 *Insurance Contracts*

contributions relate to specified individuals and/or households (which in some cases will require the contributions to be credited against the individuals' contribution accounts), the contributions made by the public sector entity are to be considered as contributions for the purposes of determining whether a social benefit scheme is intended to be fully funded from contributions in accordance with paragraph 28(a). Where a public sector entity makes contributions to fund the deficit on a social benefit scheme, the contributions are not related to specified individuals and/or households, and are not considered as contributions for the purposes of determining whether a social benefit scheme is intended to be fully funded from contributions in accordance with paragraph 28(a).

AG22. In assessing whether a social benefit scheme is intended to be fully funded from contributions, an entity considers substance over form. For example, where a social benefit scheme is in deficit for a period but the scheme has an ability to adjust the future contribution rates and/or benefits payable such that the deficit is addressed, the scheme may still satisfy the criteria to be accounted for under the insurance approach.

AG23. The reference in paragraph AG20(a) to "those whose activities create or exacerbate the social risks which are mitigated by the social benefit scheme" is intended to cover those social benefit schemes such as an accident insurance scheme that:

(a) Are funded by levies on, for example, motorists or employers in particular industries; and

(b) Provide coverage against social risks to the wider population.

Guidance on Determining Whether an Entity is Managing a Scheme in the Same Way as an Insurer

AG24. An entity is managing a social benefit scheme in the same way as an insurer would manage an insurance portfolio when the social benefit scheme has, with the exception of its legislative rather than contractual origins, the characteristics of an insurance contract. The social benefit scheme should confer the rights and obligations on parties similar to that of an insurance contract.

AG25. In determining whether it is managing a social benefit scheme in the same way as an insurer would manage an insurance portfolio, an entity considers the following indicators:

(a) Does the entity consider itself bound by the scheme in a similar manner to an insurer being bound by an insurance contract? For example, there may be evidence that the entity considers that it can amend the terms of the scheme for existing participants in a manner that an insurer could not (such as where the entity can make retrospective changes to the scheme). In such cases, the entity will not be bound in a similar manner to an insurer, and the social benefit scheme will not have the characteristics of an insurance contract. An entity will be bound by the scheme in a similar manner to an insurer where its ability to amend the scheme for existing participants is limited to:

(i) Circumstances prescribed by the legislation that establishes the scheme (equivalent to a contractual term permitting changes in specific circumstances); or

(ii) When a government is setting new contribution or levy rates (where a trade-off between the contributions and prospective benefits is part of the process of determining an appropriate rate).

(b) Are assets relating to the social benefit scheme held in a separate fund, or otherwise earmarked, and restricted to being used to provide social benefits to participants? If an entity does not separately identify amounts relating to social benefits, this will provide evidence that the entity considers the contributions as a form of taxation. The social benefit scheme will not have the characteristics of an insurance contract. There will also be practical difficulties with applying the measurement requirements of the relevant international or national accounting standard dealing with insurance contracts if the assets associated with a social benefit scheme are not separately identified.

(c) Does the legislation that establishes the social benefit give enforceable rights to participants in the event that the social risk occurs? Insurance contracts give such rights to policyholders. If the social benefit

scheme does not also include such rights, then any social benefits provided by the entity will have a discretionary nature, meaning that the social benefit scheme will not have the characteristics of an insurance contract. For rights to be enforceable, a participant would need to have the right to challenge–in a court of law, via an arbitration or dispute resolution process or similar mechanism–decisions by the entity. The decisions that may be challenged include, but are not limited to, those regarding whether an event is covered by a scheme, the level of social benefits payable by a scheme, and the duration of any social benefits payable by a scheme.

(d) An entity assesses the financial performance and financial position of a social benefit scheme on a regular basis where it is required to report internally on the financial performance of the scheme, and, where necessary, to take action to address any under-performance by the scheme. The assessment is expected to involve the use of actuarial reviews, mathematical modelling, or similar techniques to provide information for internal decision-making on the different possible outcomes that might occur.

(e) Is there a separate entity established by the government, which is expected to act like an insurer in relation to a social benefit scheme? The existence of such an entity provides evidence that the entity is managing a scheme in the same way as an insurer would manage an insurance portfolio. However, it is not a requirement for applying the insurance approach that a separate entity has been established. Relevant international and national accounting standards dealing with insurance contracts apply to insurance contracts, not just to insurance companies.

Appendix B

Amendments to Other IPSAS

[Deleted]

Basis for Conclusions

This Basis for Conclusions accompanies, but is not part of, IPSAS 42.

Objective (paragraphs 1–2)

BC1. In the absence of an International Public Sector Accounting Standard (IPSAS) dealing with social benefits, public sector entities were required to develop their own accounting policies for recognizing, measuring and presenting social benefits. As a result, there may not have been consistent or appropriate reporting of transactions and obligations related to social benefits in general purpose financial statements (financial statements). Consequently, users may not have been able to obtain the information needed to identify the social benefits provided by an entity and evaluate their financial effect. The IPSASB believes that IPSAS 42 will promote consistency and comparability in how social benefits are reported by public sector entities.

Scope and Definitions (paragraphs 3–5)

History

BC2. In developing IPSAS 42, the IPSASB noted that existing IPSAS did not define social benefits. Instead, a broad description was given in IPSAS 19, *Provisions, Contingent Liabilities and Contingent Assets.*

BC3. IPSAS 19 described social benefits as "goods, services, and other benefits provided in the pursuit of the social policy objectives of a government. These benefits may include:

(a) The delivery of health, education, housing, transport, and other social services to the community. In many cases, there is no requirement for the beneficiaries of these services to pay an amount equivalent to the value of these services; and

(b) Payment of benefits to families, the aged, the disabled, the unemployed, veterans, and others. That is, governments at all levels may provide financial assistance to individuals and groups in the community to access services to meet their particular needs, or to supplement their income."

BC4. The IPSASB also had regard to its previous work in this area. The 2004 Invitation to Comment (ITC), *Accounting for Social Policies of Government*, sought views on how to account for a wide range of social benefits. The ITC noted that "Social benefits could also be provided under other categories of government activity (for example, Defense, Public Order and Safety and Community Amenities)." These are often referred to as "collective services" or "collective goods and services."

BC5. Responses to the ITC supported the development of an IPSAS on social benefits. However, the IPSASB failed to reach a consensus on when a present obligation arises especially for contributory cash transfer schemes. Consequently, in 2008 the IPSASB issued Exposure Draft (ED) 34, *Social Benefits: Disclosure of Cash Transfers to Individuals or Households*, and a Consultation Paper (CP), *Social Benefits: Issues in Recognition and Measurement*. At this time the IPSASB also issued a Project Brief, Long-Term Fiscal Sustainability.

BC6. Respondents did not consider that the proposed disclosures in the financial statements could convey sufficient information about social benefits. Consequently, the IPSASB agreed not to proceed with ED 34.

BC7. The CP, *Social Benefits: Issues in Recognition and Measurement*, proposed a narrower definition of social benefits than had been included in the 2004 ITC. The CP included the following definition of social benefits:

"The IPSASB defines social benefits as;

(a) Cash transfers; and

(b) Collective and individual goods and services

that are provided by an entity to individuals or households in non-exchange transactions to protect the entire population, or a particular segment of the population, against certain social risks."

BC8. This definition introduced the idea of social benefits being related to social risks for the first time in the IPSASB's literature. According to this definition, not all cash transfers or collective and individual goods and services are social benefits. Only those cash transfers or collective and individual goods and services that are provided to protect the entire population, or a particular segment of the population, against certain social risks meet the definition of social benefits. The CP did not, however, define social risks.

BC9. Despite the narrower scope and the link with social risks, the IPSASB did not reach a consensus on when a present obligation arises for social benefits within the scope of the CP. The IPSASB recognized the linkages between its work in developing *The Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities (the Conceptual Framework*) and accounting for social benefits. The elements and recognition phase of the *Conceptual Framework* would define a liability. This definition and supporting analysis would influence the accounting for social benefits. The IPSASB therefore decided to defer further work on this topic until after the completion of the *Conceptual Framework.*

BC10. In the interim, the IPSASB initiated a project on the long-term sustainability of public finances in 2008, based on the project brief. Recommended Practice Guideline (RPG) 1, *Reporting on the Long-Term Sustainability of an Entity's Finances* was published in 2013.

BC11. RPG 1 provides guidance on preparing general purpose financial reports that can meet users' needs for information about the long-term fiscal sustainability of an entity, including the social benefit schemes the entity provides.

BC12. In the context of social benefits, general purpose financial reports prepared in accordance with RPG 1 will provide information about expected obligations to be settled in the future, including obligations to individuals who have not met the eligibility criteria for a scheme, or who are not currently contributing to a scheme that would entitle them to future social benefits. RPG 1 does not address the question of whether such obligations meet the definition of a present obligation, and so should be recognized in the financial statements.

BC13. General purpose financial reports prepared in accordance with RPG 1 will also include information about the expected resources to be realized in the future that will be used to finance social benefits. In many jurisdictions this will include future taxation income. Because an entity does not currently control these resources, they are not recognized in the financial statements.

BC14. The IPSASB restarted its work on social benefits in 2014. The IPSASB noted that the broad scope of social benefits included in previous projects had been a factor in the IPSASB failing to reach consensus. Consequently, the IPSASB decided to adopt a narrower definition of social benefits. At this time, the IPSASB had agreed to commence work on a non-exchange expenses project; the IPSASB considered that adopting a narrower definition of social benefits would best meet the project management needs of both projects.

Role of Government Finance Statistics (GFS)

BC15. The IPSASB considers it important to reduce differences with the statistical basis of reporting where appropriate. The IPSASB therefore considered the approach to social benefits taken in GFS.

BC16. In developing the CP, *Recognition and Measurement of Social Benefits (*issued in 2015) the IPSASB considered that social benefits, other transfers in kind and collective services would be expected to raise similar issues regarding the recognition and measurement of liabilities and expenses. However, the IPSASB considered that different factors would arise in the recognition and measurement of transactions that address specific social risks (i.e., social benefits) and those transactions that do not. For example, the recognition and measurement of an obligation in respect of social benefits may be related to individuals satisfying eligibility criteria.

BC17. Having reviewed the approach to social benefits taken in GFS, the IPSASB noted that the economic consequences described in GFS were likely to be similar to those in a future IPSAS. The IPSASB decided to align, as far as possible, its definition of social benefit with those in GFS. This was the approach taken in the CP, *Recognition and Measurement of Social Benefits.*

BC18. The alignment with GFS was intended to provide clearer definitions that demarcate transactions and events which are, in substance dissimilar. It also maximized consistency between the two frameworks, in line with the IPSASB policy paper, *Process for Considering GFS Reporting Guidelines during Development of IPSAS.*

Responses to Consultation Paper, Recognition and Measurement of Social Benefits

BC19. A majority of respondents supported the scope of the project as set out in the 2015 CP, and the IPSASB's intention to align the scope of the project, and the definitions of social benefits and social risks, with GFS. These respondents considered that alignment with GFS would assist with interpreting an IPSAS and help ensure consistency in its application.

BC20. However, a significant minority raised concerns. The main concerns were:

(a) Definition of social risk. A number of respondents considered that the definition of social risk was difficult to apply in practice, and that it was therefore difficult to differentiate between social benefits and certain other non-exchange expenses of government.

(b) The boundary between social benefits and non-exchange expenses. Some respondents considered that social benefits in kind and other transfers in kind give rise to the same issues. These respondents considered that the scope of the 2015 CP creates an artificial boundary between social benefits and other non-exchange expenses.

BC21. The IPSASB considered these concerns in developing ED 63, *Social Benefits,* as follows:

(a) The definition of social risks was reframed to fit an accounting framework as opposed to an economic/statistical framework. Although the wording of the definition was amended in ED 63, the IPSASB's intention in so doing was to clarify the meaning of the definitions for preparers, rather than to modify the risks that are considered to be social risks. The definition of social benefits was also amended to improve the clarity of the definition.

(b) ED 63 distinguished between social risks and other risks, for example, risks related to the characteristics of geography or climate, such as the risk of an earthquake or flooding occurring. The hazards or events that give rise to these risks are not related to the characteristics of individuals and/or households, which is a distinguishing feature of social risks. The IPSASB also noted that governments' responses to social risks are often different to their response to other risks. Governments usually plan for the occurrence of social risks, with schemes, backed by legislation, in place to address these risks. By contrast, governments' responses to other risks such as geographical risks are often reactive, and may be put in place following the occurrence of an event such as flooding or an earthquake. The IPSASB considered that the reactive nature of responses to other risks was more suited to its non-exchange expenses project than this Standard. The IPSASB also noted that this approach would be consistent with the approach taken in GFS.

(c) ED 63 distinguished between those benefits that are provided to specific individuals and/or households and those that are universally accessible. This distinction was intended to provide a more principles based, less artificial boundary between social benefits and other non-exchange expenses. Liabilities and expenses associated with social risks can be measured by reference to an individual's eligibility to receive the social benefit, which does not apply to other non-exchange expenses. In developing this boundary, the IPSASB acknowledged that social benefits and other non-exchange expenses form a continuum, and that any boundary will, to some extent, be artificial. However, the IPSASB's earlier experiences convinced the Board that a boundary would be required for a social benefits project to be manageable.

BC22. The effect of these decisions was to align the scope of ED 63, and its definitions of social benefits and social risks, with those in GFS, with the exception of universally accessible services. Universally accessible services such as a universal healthcare service are considered to be social benefits under GFS, but were outside the scope of ED 63. The IPSASB considered that outcome would satisfy the majority of respondents who supported alignment with GFS, whilst addressing the concerns of the significant minority of respondents who had concerns with the boundary between social benefits and other non-exchange expenses.

Responses to ED 63, Social Benefits

BC23. ED 63 specifically excluded collective services and universally accessible services from the scope of social benefits, as proposed in the 2015 CP. Most respondents to ED 63 supported the proposed scope. In doing so, respondents who supported the proposed scope commented that it was important that the boundary between social benefits and universally accessible services was clearly defined. They also commented that accounting treatments for social benefits and universally accessible services should have the same conceptual basis, with any differences in treatment being related to the different nature of the transactions.

BC24. The minority of respondents who did not support the proposed scope and definitions in ED 63 had similar concerns. These respondents considered that the scope and definitions needed to be further refined to avoid confusion and possible boundary issues or divergent accounting treatments. In particular, they considered that excluding universally accessible services from the scope of the proposed Standard could be difficult to apply, as the boundary between social benefits and universally accessible services was unclear.

BC25. As a result of these concerns, the IPSASB decided to clarify the scope and definitions. The IPSASB noted that respondents had different understandings of the scope and definitions in ED 63. Some respondents appeared to consider that social benefits were limited to cash transfers, whereas other respondents considered that social benefits included the provision of some services.

BC26. The IPSASB concluded that ED 63 was insufficiently clear about the definition of social benefits (and whether social benefits were limited to cash transfers), and therefore about the scope of the proposed Standard. The IPSASB also noted that in the Illustrative Examples provided in ED 63, all the transactions that satisfied the definition of a social benefit were cash transfers, whereas a number of the transactions that did not satisfy the definition of a social benefit involved the provision of services.

BC27. The IPSASB noted that defining social benefits as cash transfers would remove much of the confusion regarding the boundary between social benefits and universally accessible services.

BC28. The IPSASB also concluded that, when considering these transactions, there were conceptual differences between cash transfers and the provision of services. The provision of services would involve exchange transactions (for example, the expenses incurred in employing staff to provide these services or the expenses incurred in procuring goods and services from other entities). Cash transfers do not involve any additional transactions.

BC29. For these reasons, the IPSASB concluded that the economic substance of cash transfers made to individuals and households was different to the economic substance of services provided to individuals and households. The IPSASB therefore agreed that the scope of this social benefits Standard should be limited to cash transfers.

BC30. Following this decision, the IPSASB considered the nature of cash transfers. The IPSASB agreed that the form of the cash transfer was not important, and could include cash equivalents such as pre-paid debit cards. In this context, the IPSASB also agreed that cash transfers in the form of cash equivalents should impose no or limited restrictions on the use of the cash. The IPSASB noted that some jurisdictions using pre-paid debit cards imposed limited restrictions on the card, for example preventing its use to purchase alcohol or tobacco products. The IPSASB agreed that this type of limited restriction was not equivalent to a government directing how the cash

should be used. Consequently, the IPSASB agreed that the provision of a pre-paid debit card with limited restrictions on its use was a cash transfer for the purposes of the social benefits definition.

BC31. Some respondents to ED 63 did not see the rationale for distinguishing between social risks and other risks. These respondents proposed removing the reference to social risks in the definition of social benefits, and extending the scope of this Standard to include other benefits such as emergency relief.

BC32. The IPSASB noted that respondents to both the CP, Recognition and Measurement of Social Benefits and ED 63 had generally supported the reference to social risks, which maintained consistency with GFS. The IPSASB also remained of the view that governments' responses to social risks are often different to their response to other risks (see paragraph BC21(b) above).

BC33. For these reasons, the IPSASB decided to retain the reference to social risks in the definition of social benefits.

Approaches to Accounting for Social Benefits

BC34. The IPSASB consulted on three approaches to accounting for social benefits in the CP, *Recognition and Measurement of Social Benefits*. These were the obligating event approach (now referred to as the general approach), the social contract approach and the insurance approach.

BC35. The social contract approach viewed obligations to provide social benefits by governments as quasi-contractual in nature, and adopted executory contract accounting.

BC36. In developing the CP, the IPSASB came to a preliminary view that the social contract approach was not consistent with the *Conceptual Framework*. Respondents to the CP supported this preliminary view. Respondents considered that the social contract approach would result in items that met the definition of a liability not being recognized. Consequently, respondents considered that the social contract approach would not provide information that is useful for accountability and decision-making purposes.

BC37. The IPSASB noted the support for its preliminary view, and agreed not to proceed with the social contract approach.

BC38. In developing the CP, the IPSASB came to a preliminary view that a combination of the general approach and (for some or all contributory schemes) the insurance approach might be required to reflect the different economic circumstances arising in respect of social benefits.

BC39. Respondents to the CP supported this preliminary view. The IPSASB therefore agreed to develop both the general approach and the insurance approach in IPSAS 42.

Non-Exchange Expenses Project

BC40. As noted in paragraph BC14, the IPSASB has adopted a narrower definition of social benefits, considering that this would best meet the project management needs of both the social benefits project and the non-exchange expenses project.

BC41. The IPSASB issued a CP, *Accounting for Revenue and Non-Exchange Expenses*, in August 2017. In this CP, the IPSASB expressed a preliminary view that a performance obligation approach would be appropriate for recognizing and measuring some types of non-exchange expense transactions. Consequently, the IPSASB considered whether such an approach could be applied to social benefits.

BC42. The IPSASB noted that social benefits are provided where a social risk has occurred, for example an individual has become unemployed or an individual has reached retirement age. The IPSASB concluded that social risks do not involve performance of an obligation by the individual and, consequently, the performance obligation approach would not be appropriate for recognizing and measuring social benefits. For similar reasons, the IPSASB is not proposing to adopt the performance obligation approach to non-exchange expenses for universally accessible services and collective services.

General Approach (paragraphs 6–25)

Recognition

BC43. In developing the CP, *Recognition and Measurement of Social Benefits*, the IPSASB identified five distinct points at which a case could be made for recognizing a social benefit obligation in the financial statements. These were:

(a) Key participatory events have occurred;

(b) Threshold eligibility criteria have been satisfied;

(c) The eligibility criteria to receive the next benefit have been satisfied;

(d) A claim has been approved; and

(e) A claim is enforceable.

BC44. The CP sought respondents' views on these possible obligating events. The CP also asked respondents whether a future IPSAS should consider that an obligating event could arise at different points, depending on the nature of the social benefit or the legal framework under which the social benefit arose.

BC45. In reviewing the responses to the CP, the IPSASB noted that there was substantial support for the view that an obligating event could arise at different points, depending on the nature of the social benefit or the legal framework under which the social benefit arose. The IPSASB agreed to take this view into account in determining which obligating events should be included in ED 63.

BC46. The IPSASB also noted, however, that there was no consensus as to the range of different points at which an obligating event could arise. The IPSASB therefore focused on analyzing the various obligating events by reference to the *Conceptual Framework,* noting respondents' comments where these provided evidence about a particular obligating event or raised other matters that required consideration.

BC47. In developing the CP, the IPSASB had initially agreed that aligning the recognition and measurement of social benefits with GFS could only be considered once responses had been reviewed. Subsequently, the IPSASB noted that a range of recognition points might be appropriate under the general approach.

BC48. If this were the case, this would implicitly reject alignment of the recognition and measurement of social benefits with GFS under the general approach. This is because, under GFS, an expense is recorded only when the payment of the social benefits is due (i.e., in line with the claim is enforceable obligating event only).

BC49. The IPSASB also concluded that consistency with the *Conceptual Framework* should take priority over alignment with the GFS treatment. Any alignment that emerged from the IPSASB's deliberations would, therefore, be coincidental.

Requirement to Satisfy Ongoing Eligibility Criteria (Including Revalidation) Affects Recognition

BC50. The IPSASB accepted that, at least for some social benefits, the requirement to satisfy ongoing eligibility criteria (including revalidation) affects recognition as well as measurement. This could be the case where a social benefit was intended to be provided on a "one-off" or short-term basis. The IPSASB therefore considered when it would be appropriate to recognize a liability that took account of the requirement to satisfy ongoing eligibility criteria.

BC51. The first possible obligating event identified in the 2015 CP that took account of the requirement to satisfy ongoing eligibility criteria was that the eligibility criteria to receive the next benefit have been satisfied. Respondents to the CP gave significant support to the inclusion of this obligating event. Respondents noted that for some social benefits, the satisfaction of the eligibility criteria by a potential beneficiary would be sufficient to give rise to a legal obligation for an entity. Where this was not the case, respondents considered that this possible obligating event would give rise to a non-legally binding obligation. The IPSASB agreed with these comments.

BC52. A small number of respondents did not support this possible obligating event, arguing that an entity still had discretion to avoid payment until a claim has been approved. These respondents commented that no government can bind its successor, and any social benefit obligation can be changed at the whim of the government in power.

BC53. The IPSASB did not support this view. The IPSASB noted that paragraph 5.22 of the *Conceptual Framework* addressed the issue of sovereign power:

"Sovereign power is not a rationale for concluding that an obligation does not meet the definition of a liability in this Framework. The legal position should be assessed at each reporting date to consider if an obligation is no longer binding and does not meet the definition of a liability."

BC54. The IPSASB concluded that a beneficiary satisfying the eligibility criteria to receive the next social benefit would give rise to a present obligation that meets the definition of a liability. Consequently, the IPSASB agreed that the 'eligibility criteria to receive the next social benefit have been satisfied' obligating event should be included as an obligating event in ED 63.

BC55. The IPSASB next considered the claim has been approved and claim is enforceable obligating events. The IPSASB noted that respondents generally did not support the use of these obligating events. In particular, a significant majority of respondents opposed the use of the claim is enforceable obligating event, arguing that it would limit the recognition of a liability to those cases where a legal obligation existed. Respondents argued that this was inconsistent with the *Conceptual Framework,* which recognizes that liabilities can arise from non-legally binding obligations.

BC56. Respondents also argued that, once eligibility criteria have been satisfied, a present obligation that the entity would have little or no realistic alternative to avoid would usually arise. Consequently, a liability would arise prior to a claim being approved or becoming enforceable.

BC57. The IPSASB concurred with respondents' views, and decided that, for social benefits where there was a requirement to satisfy ongoing eligibility criteria only the 'eligibility criteria to receive the next social benefit have been satisfied' obligating event should be included in ED 63.

BC58. In coming to this conclusion, the IPSASB noted that there may be social benefits where the eligibility criteria are not met until a claim has been approved or is enforceable. The IPSASB considered these obligating events to be effectively subsets of the 'eligibility criteria to receive the next social benefit have been satisfied' obligating event. Consequently, these obligating events did not need to be separately addressed.

Requirement to Satisfy Ongoing Eligibility Criteria (Including Revalidation) Affects Measurement Only

BC59. As noted in paragraph BC50, the IPSASB accepted that, at least for some social benefits, the requirement to satisfy ongoing eligibility criteria (including revalidation) affects recognition as well as measurement.

BC60. In developing ED 63, the IPSASB considered whether, for some other social benefits, the requirement to satisfy ongoing eligibility criteria (including revalidation) should only affect measurement, not recognition.

BC61. The IPSASB noted that for a liability to exist, there has to be a past event that gives rise to the liability. The IPSASB considered the nature of the past event for a social benefit and concluded that the past event is the satisfaction of all eligibility criteria, which may include being alive. Consequently, any liability that arises is only for the next social benefit. Additional liabilities only arise when all eligibility criteria are met for further social benefits.

BC62. In coming to this conclusion, the IPSASB also had regard to a number of supporting points:

(a) Accepting that the requirement to satisfy ongoing eligibility criteria (including revalidation) should only affect measurement, not recognition, could result in entities reporting present obligations for long-term social benefits for certain social benefit schemes (primarily old-age pensions). For other social benefit schemes,

entities would recognize relatively short-term social benefits, even though for certain schemes, they may ultimately be paid to beneficiaries over a long-term horizon (e.g., income-based welfare benefits).

(b) Being alive is an explicit eligibility criterion for some social benefit programs, established through law or policy, and in these cases there is frequently active compliance monitoring and enforcement. Many public sector entities take active steps to periodically validate that a beneficiary is alive and actively monitor and enforce compliance with this eligibility criterion. For example, annual certifications that the beneficiary is alive may be required. Also, there may be requirements for hospitals, funeral homes, or others to report deaths. Further, many public sector entities retract social benefits improperly paid to beneficiaries who are not alive or prosecute fraudulent non-reporting of a beneficiary's death. For other social benefit programs, being alive is an implicit eligibility criterion. Similar recovery action is taken where social benefits were improperly paid to beneficiaries who are not alive.

(c) Meeting all eligibility requirements creates an obligation to provide a social benefit related to eligibility requirement(s) that are met, consistent with social benefit schemes where there are ongoing eligibility requirements. Typically, for an individual social benefit scheme, eligibility requirements and related social benefits are clearly established. For example, a social benefit may be paid monthly based on meeting eligibility criteria as of the end of the prior month. This would be true both for schemes that have ongoing eligibility criteria (other than being alive) and those where being alive is the only ongoing eligibility criteria.

(d) The requirement to satisfy ongoing eligibility criteria (including revalidation) is consistent with the approach the IPSASB proposed for universally accessible services and collective services in its CP, *Accounting for Revenue and Non-Exchange Expenses.*

BC63. The IPSASB also considered paragraph 5.21 of the *Conceptual Framework,* which states (emphasis added):

"Some obligations related to exchange transactions are not strictly enforceable by an external party at the reporting date, but will be enforceable with the passage of time without the external party having to meet further conditions—or having to take any further action—prior to settlement. Claims that are unconditionally enforceable subject to the passage of time are enforceable obligations in the context of the definition of a liability."

BC64. The IPSASB considered whether, although social benefits are not exchange transactions, a liability should be recognized for social benefit schemes such as retirement benefits when threshold eligibility criteria are met. This would be as a result of legal obligations arising with the passage of time without the beneficiary having to take any further action or meet further conditions.

BC65. The IPSASB concluded this was not appropriate. Paragraph 5.21 of the *Conceptual Framework* relates solely to legal obligations in the context of exchange transactions, as indicated. Specifically, this paragraph would apply where the external party in the exchange transaction has met all of the conditions of the exchange transaction and it is unconditionally enforceable, but the public sector entity will not meet its conditions until after the reporting date.

BC66. Consequently, the IPSASB considered that the only appropriate obligating event is that all eligibility criteria for the next social benefit have been met. The IPSASB concluded that this approach, combined with the insurance approach, would recognize the nature of the social benefit and the legal framework under which the social benefit arises.

BC67. The IPSASB also considered that there would be practical difficulties with recognizing a liability prior to all eligibility criteria for the next payment (including being alive) being satisfied. The IPSASB noted that approaches such as 'threshold eligibility criteria have been met' are said to give rise to a non-legally binding obligation where there is a valid expectation that results in an entity having little or no realistic alternative to settling the obligation. The basis for including threshold eligibility is that a valid expectation will arise when there are no further eligibility criteria (excluding being alive) to be satisfied. The IPSASB was not convinced that this would be the case in all instances, and considered that there may be situations where:

(a) A valid expectation that results in an entity having little or no realistic alternative to settling the obligation did not arise, even though there were no further eligibility criteria to be satisfied; or

(b) A valid expectation that results in an entity having little or no realistic alternative to settling the obligation arose, even though there were further eligibility criteria to be satisfied.

BC68. The IPSASB considered that similar difficulties would arise with other obligating events that occur prior to all eligibility criteria being satisfied, such as 'key participatory events have occurred'.

BC69. The IPSASB considered that, under these alternative obligating events, determining whether a valid expectation that results in an entity having little or no realistic alternative to settling the obligation has arisen could only be determined on a case by case basis. The IPSASB considered that this would result in inconsistent application of any IPSAS based on ED 63, and considered that this was a further reason for not including the 'threshold eligibility criteria obligating event' in ED 63.

BC70. The IPSASB concluded that only the 'eligibility criteria for the next social benefit have been met' recognition point should be included in ED 63, and that the accounting treatment should reflect that being alive may be an eligibility criterion (whether explicitly stated or implicit) that affects recognition.

Approach to Developing Exposure Draft 63

BC71. In coming to the conclusion that only the 'eligibility criteria for the next social benefit have been met' recognition point should be included in ED 63, the IPSASB did not reach consensus, with some members holding the view that other recognition points should also be included in ED 63.

BC72. These members were of the opinion that prescribing a single recognition point applicable to all social benefits is inappropriate, as this approach:

(a) Does not reflect the economic substance of different social benefits;

(b) Is not in accordance with the *Conceptual Framework*; and

(c) Treats "being alive" as a recognition criterion instead of a measurement criterion.

BC73. These members therefore proposed, in an Alternative View, that the obligating event should be dependent on the economic substance of each social benefit scheme. The conceptual basis for these members' Alternative View is set out in paragraphs BC74–BC93 below.

Conceptual Basis for Alternative View

BC74. In the view of those members, for some social benefits, recognizing a liability when the eligibility criteria for the next benefit are satisfied would be appropriate. For other social benefits, a liability should be recognized at an earlier point. For example, a liability for all remaining benefits might be recognized when an individual reaches retirement age, or a liability might be accrued over time as an individual makes contributions. Preparers would determine which obligating event is most appropriate for their individual social benefit schemes, based on their economic substance.

The Approach Set Forth in ED 63 did not Reflect the Economic Substance of Different Social Benefits and thus did not Result in Information that Meets the Needs of Financial Statement Users

BC75. The members who proposed the Alternative View noted that the IPSASB's constituents who responded to the *Consultation Paper, Recognition and Measurement of Social Benefits*, expressed substantial support for the view that an obligating event could arise at different points, depending on the nature of the social benefit or the legal framework under which the social benefit arose. Therefore, these members did not dispute that in some cases a liability in respect of social benefits should be recognized only when the eligibility criteria for receipt of the next benefit (but not with the inclusion of being alive) have been satisfied, but they disputed this for other cases.

BC76. They considered that since social benefit schemes vary, they can give rise to differing expectations throughout the population as a whole. For example, a social benefit scheme designed to be funded by future beneficiaries (i.e., operating on a pay-as-you-go basis) will give rise to expectations at the reporting date of entitlement amongst current recipients and potential future recipients, for example, based on the fact that individuals have contributed in the past. A differently designed social benefit scheme may not give rise to equal expectations.

BC77. These members accepted that the relative validity of these expectations may differ, for example expectations may be based on a legal right to receive a benefit notified to the scheme's recipients and participants, on a long running precedent, or on other, less compelling grounds. Thus they contended that the nature of the expectations in any given case must be taken into account in the determination of whether an entity has a realistic alternative to avoid an outflow of resources when recognizing a liability in relation to social benefits.

BC78. These members therefore considered that treating all social benefits in the same manner, regardless of different economic substance, would not provide users with the information they needed to assess social benefits.

BC79. These members believed that financial statement users need relevant, faithfully representative information as to the economic substance of social benefits for their different decision making purposes, including, where relevant, assessing the intergenerational impacts of social benefits.

BC80. For example, in respect of a state pension scheme designed to be funded on an inter-generational basis, the amount of the entity's present obligation at the reporting date (excluding being alive as an entitlement criterion) to both current beneficiaries and participants provides useful information as to the magnitude as at the reporting date of pension payments that will need to be funded by future contributions from current and future participants.

BC81. Not recognizing a liability at the reporting date beyond the next payment would not facilitate, for example, the reflection of changes in policy for state pensions (for example, raising retirement age) in the amount of the liability at a subsequent reporting date. It will also give a false message to current beneficiaries and participants as well as to future contributions as to the entity's acknowledgement of their respective entitlements.

BC82. Furthermore, not recognizing an obligation at the reporting date beyond the next payment does not reflect the economic substance of contributory schemes. Contributions will be shown as revenue when paid by the participant, whereas the part of the benefit that is earned with this payment will not be shown at this point in time as an obligation, but only (probably years later) when the payment is made to the then beneficiary, respectively the former participant.

The Approach Set Forth in ED 63 was not in Accordance with the IPSASB's *Conceptual Framework*

BC83. In the view of the members who proposed an Alternative View, the approach in ED 63 would not achieve the qualitative characteristics: relevance, faithful representation, understandability or comparability.

BC84. These members also considered that reflecting the economic substance of a social benefit is necessary to meet the qualitative characteristic of comparability, which the Conceptual Framework defines as "the quality of information that enables users to identify similarities in, and differences between, two sets of phenomena." Therefore, these members disagreed with the argument of inconsistent application, as explained in paragraph BC69. In contrast these members contended that if the economic substance of the social benefits differs amongst schemes and jurisdictions, those differences should be reflected in the financial statements' accounting for social benefits. This would be a consistent application of accounting principles to different economic phenomena resulting in different accounting outcomes.

BC85. Consequently, these members considered that, for some social benefits, it would be appropriate to recognize a liability that exceeds the amount of benefit until the next point at which eligibility criteria are required to be satisfied. They noted that paragraph 8.15 of the IPSASB's *Conceptual Framework's* explains that disclosure (in the notes accompanying the financial statements) is not a substitute for display (on the face of a financial statement).

BC86. They pointed out that the IPSASB's *Conceptual Framework* states the following (emphasis added):

> 5.14. A liability is: A present obligation of the entity for an outflow of resources that results from a past event.
>
> 5.15. Public sector entities can have a number of obligations. A present obligation is a **legally binding** obligation (legal obligation) or **non-legally binding obligation**, which an entity has little or no realistic alternative to avoid. Obligations are not present obligations unless they are binding and there is little or no realistic alternative to avoid an outflow of resources.
>
> 5.20. …For some types of non-exchange transactions, judgement will be necessary to determine whether an obligation is enforceable in law. Where it is determined that an obligation is enforceable in law, there can be no doubt that an entity has no realistic alternative to avoid the obligation and a liability exists.
>
> 5.25. The point at which an obligation gives rise to a liability depends on the nature of the obligation. Factors that are likely to impact on judgements whether other parties can validly conclude that the obligation is such that the entity has little or no realistic alternative to avoid an outflow of resources include:
>
> - The nature of the past event or events that give rise to the obligation…
> - The ability of the entity to modify or change the obligation before it crystallizes…
> - There may be a correlation between the availability of funding to settle a particular obligation and the creation of a present obligation….
>
> 5.26. "Economic coercion", "political necessity" or other circumstances may give rise to situations where, although the public sector entity is not legally obliged to incur an outflow of resources, the economic or political consequences of refusing to do so are such that the entity may have little or no realistic alternative to avoid an outflow of resources. Economic coercion, political necessity or other circumstances may lead to a liability arising from a non-legally binding obligation."

BC87. They contended that in accordance with the IPSASB's *Conceptual Framework*, in some cases a liability may arise from a key participatory event that occurs prior to the eligibility criteria for the next benefit having been satisfied. This may be the case, for example, in respect of certain contributory social benefit schemes, or where there is a legally binding present obligation.

The Criterion "Being Alive" is not a Recognition Criterion, but a Measurement Criterion

BC88. These members did not consider that being alive at the point at which the eligibility criteria are satisfied ahead of each payment cycle is an implicit eligibility criterion impacting the recognition of an entity's present obligation in respect of all social benefits.

BC89. They noted that whilst it cannot be certain that a specific individual who meets the eligibility criteria at the reporting date will be alive at the point in time the next provision of social benefit is due, it is reasonable to assume that a measurable number of individual beneficiaries will be alive into the future and therefore the entity can have a binding present obligation at the reporting date in respect of provision of the social benefit beyond the next due installment of the social benefit.

BC90. They did not believe that there is a social benefit-specific imperative to treat "being alive" differently in comparison to its treatment in regard to other economic phenomena such as a pension payable as a post-employment benefit to public sector employees pursuant to IPSAS 39. Where applicable, reference to, e.g., mortality statistics etc. could equally be made in measuring liabilities for social benefits.

BC91. These members considered that the inclusion of being alive as a recognition criterion, resulting in a present obligation for only the next due benefit for all social benefits, would distort the recognition of entity's present obligation in relation to social benefits, for example pension schemes, since in many cases it would result in recognition of a liability for only the provision of the next social benefit. Such an approach fails to recognize the valid expectation of longevity in a given recipient population and cannot provide relevant information about social benefit schemes.

BC92. In their view, being alive was therefore a criterion to be taken into account in the measurement of social benefit liabilities. In this context, they also noted that the material in ED 63 in regard to measurement might need further consideration in order to include being alive as a measurement criterion.

BC93. The definition of a liability in the *Conceptual Framework* requires that an item can be measured in a way that achieves the qualitative characteristics and takes account of the constraints on information included in general purpose financial reports. The members who proposed the Alternative View recognized that accounting estimates are subject to inherent estimation uncertainty; this requirement can usually be met when recognizing liabilities existing at the reporting date for future payments for appropriate social benefits. Uncertainties as to the actual amount likely to be settled at a future date or the ability of the entity to settle would be reflected in the measurement of the liability. Uncertainties such as how many recipients will reach which age before dying are dealt with by reference to mortality statistics etc.

Arguments for Stakeholders' Consideration in ED 63

BC94. As a consequence of the lack of consensus, the IPSASB agreed to develop ED 63 in a manner that would allow stakeholders to consider the different arguments. The 'eligibility criteria for the next social benefit have been met' recognition point was included in ED 63 as all members agreed that this would be appropriate for at least some social benefits. Other recognition points were not included in ED 63 as some members considered that these recognition points would never be an appropriate recognition point for a social benefit. In agreeing to develop ED 63 in this manner, the IPSASB noted that members who supported the inclusion of other recognition points had set out their reasoning in an Alternative View. The IPSASB considered it important from a public interest perspective that this reasoning was exposed to stakeholders.

BC95. In agreeing to develop ED 63 in this manner, the IPSASB confirmed its previously expressed view that the financial statements cannot satisfy all of a user's information needs on social benefits. Further information about the long-term fiscal sustainability of those social benefit schemes is required. The IPSASB considered that adoption of the guidance in RPG 1 would provide users with the information they need. Consequently, the IPSASB agreed to encourage entities to prepare general purpose financial reports that provide information on the long-term sustainability of the entity's finances. In so doing, the IPSASB also noted that such information would be equally helpful where an entity had adopted the insurance approach.

Responses to ED 63, *Social Benefits*

BC96. The responses to ED 63 reflected the wide range of views that had surfaced during the IPSASB's deliberations in developing ED 63. While a number of respondents supported the proposals in ED 63, a similar number supported the approach outlined in the Alternative View (see paragraphs BC71–BC93 above).

BC97. The reasons given by respondents for supporting either the proposals in ED 63, the Alternative View, or some variation on either of these approaches generally reflected the issues the IPSASB had debated in arriving at its proposed approach.

BC98. Where new issues were raised by respondents, these generally reflected concerns that the information that would be presented under the Alternative View could be misunderstood. One respondent was concerned that the Alternative View, by recognizing liabilities at an earlier point, might provide perverse incentives to reduce the time span of social benefits and thus avoid recognition of bigger liabilities and bigger related expenses. Similarly, one respondent was concerned that the larger liabilities that would be recognized under the Alternative View could

be misleading; in their view, a forward looking approach, taking account of future benefits and contributions, is required to assess the sustainability of social benefits such as state pensions.

BC99. The IPSASB concluded that these issues reflected the Board's earlier debates about the users' information needs and the qualitative characteristics.

BC100. The IPSASB noted that there was no consensus about whether recognizing a large liability for social benefits without also recognizing an asset for the future taxation or contribution revenue that would fund the settlement of that liability would provide useful information. There were different views as to whether the recognition or non-recognition of this liability would best satisfy the qualitative characteristics of relevance, faithful representation, understandability and comparability.

BC101. However, because the consultation process had not generated any significant new conceptual issues, the IPSASB did not consider that undertaking further work in developing the conceptual approach to social benefits would be fruitful. The long history of the IPSASB's work on social benefits suggested that the strong views held by individuals on both sides of the argument were unlikely to be changed by any such further work at this stage.

BC102. Consequently, the IPSASB agreed to proceed with an IPSAS based on the proposals in ED 63.

BC103. In coming to this conclusion, the IPSASB noted that preparers' experiences of applying an IPSAS on social benefits along with users' experiences of using the information provided may suggest ways of better reconciling the different views that exist. The IPSASB therefore considered it likely that a post-implementation review of IPSAS 42 would be appropriate at some point in the future.

BC104. In developing an IPSAS based on the proposals in ED 63, the IPSASB noted that many respondents, whether they supported the proposals in ED 63 or the Alternative View, were concerned that 'being alive' had been over-emphasized in the Exposure Draft. They considered that there were circumstances where reliance on being alive would be inappropriate. Some respondents also expressed concerns over the different treatment of 'being alive' in ED 63 and in IPSAS 39. However, a small minority of respondents considered that the reliance on being alive was necessary.

BC105. The IPSASB considered these comments, and agreed to modify the requirements to reduce the emphasis on being alive. The IPSASB considered that in many cases, being alive would be an eligibility criterion, and that being alive would therefore affect recognition of a liability. The IPSASB acknowledged, however, that this might not always be the case, and that the IPSAS should reflect this.

BC106. In making these changes, the IPSASB included additional guidance that the satisfaction of the eligibility criteria for each social benefit payment is a separate past event. Satisfaction of the eligibility criteria for a benefit beyond the next payment is a future event that does not give rise to a present obligation.

BC107. In acknowledging that there had been significant support for the Alternative View, the IPSASB considered whether it would be appropriate to accommodate both accounting treatments in IPSAS 42. This would permit preparers to use the Alternative View for social benefit schemes where they determine that a different past event to that proposed in ED 63 is appropriate. The IPSASB concluded that this would not satisfy the qualitative characteristic of consistency, and decided not to incorporate the accounting treatment set out in the Alternative View into IPSAS 42.

Use of Term "Resources"

BC108. In developing ED 63, the IPSASB included recognition requirements that referred to an entity having "a present obligation for an outflow of resources that results from a past event." Following the decision to clarify that the definition of social benefits only includes cash transfers, the IPSASB debated whether the use of the term "resources" in the recognition requirements should be replaced with the term "cash transfers." The IPSASB noted that the definition of a liability in the *Conceptual Framework* referred to "resources", and as a consequence the Board agreed to retain that term in the recognition requirements.

Measurement

BC109. In developing the 2015 CP, the IPSASB came to a preliminary view that, "under the obligating event approach [general approach], liabilities in respect of social benefits should be measured using the cost of fulfillment. The cost of fulfillment should reflect the estimated value of the required benefits." The *Conceptual Framework* defines the cost of fulfillment as "the costs that the entity will incur in fulfilling the obligations represented by the liability, assuming that it does so in the least costly manner."

BC110. The IPSASB came to this view because:

(a) Many social benefits liabilities will arise from non-exchange transactions. There may be no consideration on which a historical cost value could be based. Historical cost can also be difficult to apply to liabilities that may vary in amount, which may be the case with some social benefits.

(b) It is extremely unlikely that there will be a market value for social benefits.

(c) In the context of social benefits, the cost of release is the amount that "a third party would charge to accept the transfer of the liability." For social benefits, a transfer of the liability will rarely be practically possible.

(d) Assumption price "is the amount which the entity would rationally be willing to accept in exchange for assuming an existing liability." This is not relevant to the measurement of social benefits under the general approach. Under this approach, the liability is viewed as arising as a result of the public sector entity's own actions.

BC111. Respondents to the CP supported this view, as did respondents to ED 63. Consequently, the IPSASB agreed that liabilities in respect of social benefits should be measured using the cost of fulfillment (i.e., the social benefit payments to be made, discounted where the payment will not be made in the next year). In coming to this decision, the IPSASB agreed that the cost should refer to the cash transfer being made, and should not include other elements such as administrative costs and bank charges.

Revenue

BC112. At the time of developing IPSAS 42, the IPSASB had an ongoing project to review the requirements in all of its revenue standards. The IPSASB decided that social contributions (revenue in respect of a social benefit scheme) and similar compulsory contributions and levies would be best addressed in that project, to ensure that all revenue is accounted for on a consistent basis. However, as the IPSASB had concluded that social contributions are non-exchange transactions, the IPSASB agreed to amend IPSAS 23, *Revenue from Non-Exchange Transactions (Taxes and Transfers)* to clarify that social contributions are accounted for in accordance with that Standard. The one exception to this is where an entity elects to account for a social benefit scheme using the insurance approach. The insurance approach takes into account both cash inflows and cash outflows, and hence contributions to a social benefit schemes accounted for under the insurance approach are not accounted for as revenue under IPSAS 23.

Disclosure

BC113. In developing ED 63, the IPSASB agreed that entities should disclose information that explains the characteristics of - its social benefit schemes; identifies and explains the amounts in its financial statements arising from its social benefit schemes; and quantifies and explains the future cash flows that may arise from its social benefit schemes.

BC114. The IPSASB considered whether to provide guidance on aggregating the disclosures for social benefit schemes that are not individually material. The IPSASB noted that IPSAS 1*, Presentation of Financial Statements*, contains guidance on materiality and aggregation, and concluded that no further guidance was required.

BC115. As part of the explanation of the characteristics of a social benefit scheme, the IPSASB agreed that an entity should explain how a social benefit scheme is funded. Where a scheme is funded, (whether in full or in part) by social contributions, an entity is required to provide a cross reference to the location of information on those social contributions. Although IPSAS 42 does not address social contributions (as explained in paragraph BC112 above), the IPSASB considers that users will need information about social contributions in order to make assessments of social benefit schemes. However, the IPSASB acknowledges that in some jurisdictions, social contributions for various social benefits may be collected by one entity, and the social benefits provided by another entity. In these circumstances, the entity that provides the social benefits would include a cross reference to the financial statements of the entity that collects the social contributions.

BC116. The IPSASB considered whether to require an entity to describe how its social benefit schemes may give rise to future obligations. The IPSASB decided not to require such disclosures. However, in developing ED 63 the IPSASB agreed that providing the entity's best estimate of the projected cash outflows for the next five reporting periods would provide useful information for users of the financial statements. The IPSASB considered that such information would assist users in assessing the liquidity and solvency of the entity.

Responses to ED 63, *Social Benefits*

BC117. Respondents to ED 63 generally supported the proposed disclosures about the characteristics of an entity's social benefit schemes, and the IPSASB agreed to retain these disclosures in IPSAS 42.

BC118. Most respondents also supported the proposed disclosures of the amounts in the financial statements. However, some respondents questioned the level of detail required when presenting the amounts in the financial statements. Given the likely short-term nature of the liabilities that would be recognized in respect of social benefits, these respondents did not consider that the proposed reconciliation (of the opening and closing balances of the liability) would provide any information that would not be available elsewhere in the financial statements. They considered that the requirement to present the reconciliation could be removed without any loss of information. The IPSASB concurred with the view of these respondents that the reconciliation of the liability was not necessary. The IPSASB did consider, however, that users would need information about the expenditure on each material social benefit scheme, and agreed to require the disclosure of this information rather than the reconciliation.

BC119. With regards to the proposed disclosure of future cash outflows, there was no consensus among respondents. Respondents, regardless of whether they supported the proposed disclosure or not, raised a number of issues:

(a) Future cash flows are not required for other transactions (such as tax revenue).

(b) Financial statements report on the current position of an entity, whereas future cash outflows are part of an entity's budget forecast information, not information about the current position.

(c) Projections of outflows are best considered together with projections of inflows and are most useful when they are comprehensive, rather than focusing on a single social benefit scheme. In many cases, it would not be possible to project cash inflows for a single social benefit scheme as a number of social benefit schemes will be funded from the general tax take.

(d) Disclosing future cash outflows could imply that the future cash outflows represent a liability or obligation, which is inconsistent with the general approach.

BC120. The IPSASB accepted the concerns raised by respondents, in particular the concern that the disclosure would go beyond reporting on the current position of an entity. Consequently, the IPSASB agreed to remove the requirement to disclose future cash outflows.

BC121. The IPSASB considered, however, that users would need some information to help them assess how circumstances may impact social benefit schemes. The IPSASB therefore agreed to require preparers to provide

a narrative disclosure explaining the demographic, economic and other external factors that affect its social benefit schemes.

BC122. A further suggestion from respondents was that an entity should disclose where a social benefit scheme met the criteria to be accounted for using the insurance approach. The IPSASB agreed that this is important information about the characteristics of a social benefit scheme, and that an entity should disclose where the criteria for using the insurance approach had been satisfied.

Insurance Approach (paragraphs 26–31)

Application of the Insurance Approach

BC123. In the CP, *Recognition* and Measurement of Social Benefits, the IPSASB proposed an approach based on insurance accounting for some or all contributory schemes. The IPSASB proposed that this approach should be based on the IASB's proposed IFRS Standard on insurance contracts, contained in Exposure Draft ED/2013/7, *Insurance Contracts* (June 2013). This ED has subsequently been further developed and issued as IFRS 17, *Insurance Contracts*.

BC124. Respondents to the CP generally supported the IPSASB's proposals regarding the insurance approach, although a number of concerns were raised. Respondents considered that the insurance approach should only be applied in limited circumstances. These were that the social benefit scheme operated in a similar manner to an insurance contract, and that the scheme was funded from dedicated sources of revenue, not general taxation. Respondents considered that applying the insurance approach to other social benefit schemes would not faithfully represent the economic substance of those schemes.

BC125. The IPSASB concurred with this view. Consequently, the IPSASB agreed that the insurance approach should only be applied where:

(a) The social benefit scheme is intended to be fully funded from contributions; and

(b) There is evidence that the entity manages the scheme in the same way as an issuer of insurance contracts, including assessing the financial performance and financial position of the scheme on a regular basis.

BC126. In developing ED 63, the IPSASB then considered whether the insurance approach should be mandatory for social benefit schemes that meet the criteria, or optional.

BC127. The IPSASB considered that, for a social benefit scheme that meets the criteria to apply the insurance approach, that approach is expected to provide the information that best meets users' needs. In order to assess whether the entity is managing the financial performance of the social benefit scheme appropriately, users will need information as to whether the contributions are sufficient to meet the expected liabilities. Where a loss is recorded under the insurance approach, this will provide users with the information they need to question whether a scheme is sustainable without changes to contribution rates or benefits. Similarly, if a social benefit scheme has ongoing large surpluses, this will allow a debate as to whether that scheme is being used to subsidize other expenditure, and if so, whether this is appropriate. The IPSASB initially considered that the fact that users' needs are best met by the insurance approach was the main reason for making the insurance approach mandatory.

BC128. The insurance approach is, however, expected to be more costly and complex to implement than the general approach. Actuarial estimates may not be required under the general approach. The insurance approach will require estimates of cash inflows and cash outflows over the duration of the scheme. In addition, the IASB had only recently issued IFRS 17 and that Standard has significantly different requirements from many existing national standards dealing with insurance. Consequently, it may take some time for any practical issues to be fully identified and addressed. Applying these new requirements to social benefits would introduce a further level of complexity. The IPSASB considered that there may be cost/benefit reasons for not using the insurance approach, and that this was the main reason for making the insurance approach an optional approach.

BC129. The IPSASB did note that, if an entity is managing a social benefit scheme as if it were a portfolio of insurance contracts, the entity may already have the information required to implement the insurance approach. It may also need that information in order to be able to effectively manage the social benefit scheme. This suggested that, where a social benefit scheme meets the criteria to be accounted for under the insurance approach, the costs associated with so doing may not be as high as it would initially appear.

BC130. The IPSASB considered that a further advantage of making the insurance approach optional would arise where an entity is having difficulty determining whether the criteria for applying the insurance approach have been met. The entity could avoid expending additional resources to make that determination by electing to apply the general approach.

BC131. However, the IPSASB accepted that making the insurance approach optional would carry the risk that very few entities adopt the approach, and that users would not be provided with the most appropriate information about some social benefit schemes. Social benefit schemes that could be accounted for under the insurance approach are likely to have a different economic substance to other social benefit schemes, which the general approach may not fully capture.

BC132. On balance, the IPSASB considered that the insurance approach should be optional, based on the cost/benefit reasons given above. The IPSASB noted that this could be revisited at a future date, once entities have experience with applying the new IFRS Standard, and the insurance approach proposed in ED 63.

Responses to ED 63, *Social Benefits*

BC133. As discussed above, ED 63 proposed that the insurance approach should be optional. Respondents to ED 63 had mixed views on the proposal, with some respondents agreeing that the insurance approach should be optional, and others proposing that the insurance approach should be mandatory where schemes satisfied the criteria.

BC134. The IPSASB noted that the reasons given by respondents reflected the Board's earlier discussions, with the key issue being whether the benefits of the better information that the insurance approach would provide would outweigh the cost of producing that information. Some respondents were also concerned that the existence of options within IPSAS may reduce the ability of users to make comparisons between entities.

BC135. On balance, the IPSASB considered that no new information had arisen from the responses to ED 63 that was sufficiently persuasive to lead to a modification of the proposals in ED 63. The IPSASB therefore agreed to retain the insurance approach as an optional approach in this Standard.

BC136. However, the IPSASB also considered that it would be appropriate to keep this issue under review, given the lack of consensus amongst respondents and the likelihood of practice developing as entities gained practical experience of implementing both this Standard and IFRS 17. This practical experience may cause the IPSASB to reconsider its view on the cost-benefit balance.

BC137. Most respondents to ED 63 agreed that the criteria for determining whether an entity was permitted to apply the insurance approach were appropriate. However, some respondents had doubts regarding the requirement that the social benefit scheme is intended to be fully funded from contributions.

BC138. These respondents considered that there would be cases where the requirements in IFRS 17 would be appropriate where a scheme was substantially funded from contributions rather than fully funded from contributions. A particular concern was that a scheme could be classed as fully funded by an individual entity, where another entity made contributions on behalf of those who could not afford to do so, but that the scheme would not be classed as fully funded in the consolidated financial statements. These respondents considered that the management of the scheme was more significant than the funding approach.

BC139. The IPSASB noted these concerns. The IPSASB remained of the view that a scheme that was designed to be funded in part through general taxation was not being managed in the same way as an insurance portfolio.

BC140. However, the IPSASB agreed that where an entity made contributions on behalf of those who could not afford to do so, these should be treated as contributions and the scheme classified as being fully funded from contributions. The IPSASB agreed to include Application Guidance to clarify this point.

BC141. Some respondents also commented that the decision as to whether the criteria for applying the insurance approach have been satisfied should focus on substance over form. The IPSASB noted that substance over form is embedded in the *Conceptual Framework* notion of faithful representation. However, the IPSASB agreed that additional Application Guidance emphasizing the need to consider substance over form in assessing the criteria for applying the insurance approach would be helpful for preparers.

Accounting Requirements

BC142. In the CP, *Recognition and Measurement of Social Benefits,* the IPSASB proposed that the insurance approach should be based on the IASB's Exposure Draft.

BC143. The IPSASB identified three options for introducing the insurance approach in ED 63:

(a) Develop the insurance approach in ED 63. The IPSASB noted that this option would be consistent with the proposals in the CP, and would be tailored to social benefits. However, this option would significantly increase the duration of the project, and would not have wider application.

(b) Develop a separate IPSAS on insurance. The IPSASB noted that this would fill a gap in the IPSASB's literature and could address social benefits as well as having wider application. However, the IPSASB noted that such an IPSAS was not included in the IPSASB's work plan, and that developing an additional Standard would delay the social benefits project.

(c) Direct preparers to apply IFRS 17 (or the relevant national accounting standard dealing with insurance) by analogy to a social benefit scheme that meets the criteria for applying the insurance approach. The IPSASB noted that this would require less resources and would ensure consistency with IFRS. However, guidance on social benefit specific issues might be required.

BC144. The IPSASB noted that the number of preparers to whom the insurance approach will be relevant is likely to be small. The IPSASB also noted that the criteria for applying the insurance approach meant that only those social benefit schemes that were very similar to insurance contracts would be affected.

BC145. The IPSASB concluded, therefore, that the additional time and resources required to develop the insurance approach, either in ED 63 or as a separate IPSAS on insurance, could not be justified. The IPSASB agreed to direct preparers to apply IFRS 17 (or the relevant national accounting standard dealing with insurance) by analogy to a social benefit scheme:

(a) That meets the criteria for applying the insurance approach; and

(b) Which the entity elects to account for under the insurance approach.

BC146. The IPSASB then considered whether any guidance on social benefit specific issues was required when applying IFRS 17 (or the relevant national accounting standard dealing with insurance) by analogy to a social benefit scheme. In particular, the IPSASB considered whether the arrangements in IFRS 17 in respect of the discount rate and the risk adjustment were appropriate for a social benefit scheme. In considering these questions, the IPSASB agreed to limit the application of the insurance approach to those cases where an entity would be referring to IFRS 17 or a national standard that has adopted substantially the same principles as IFRS 17. This is because other standards, for example IFRS 4, *Insurance Contracts* (and national standards based on IFRS 4) may not provide information that meets users' needs and satisfy the qualitative characteristics.

BC147. The requirements in IFRS 17 specify that the selected discount rate should adjust the future cash flows to reflect the time value of money. Such rates should be consistent with observable market prices for instruments with cash flows that are consistent with the timing, currency and liquidity of the insurance contract. The IPSASB noted

that these requirements differ from those in IPSAS 39, *Employee Benefits*, where no liquidity adjustment is included in the discount rate.

BC148. The IPSASB noted that statistical reporting uses consistent discount rates for accounting for employee benefits and social benefits. Consistency with statistical reporting would suggest adopting the approach to discount rates specified in IPSAS 39.

BC149. The IPSASB considered the nature of a liquidity adjustment. Where financial markets are illiquid, a seller of a financial instrument may have to accept a lower price for the instrument. This may lead them to demand a higher market yield. Longer duration insurance contracts may be seen as illiquid. In developing the CP, the IPSASB questioned whether the notion of a policy holder demanding a higher market yield is relevant where the terms of a social benefit are prescribed by government.

BC150. For these reasons, the IPSASB came to the view, in developing the CP, that the discount rate used under the insurance approach should not include a liquidity adjustment. The IPSASB took the view at that time that the discount rate approach in IPSAS 39 was appropriate. Respondents to the CP generally concurred with this view.

BC151. The IPSASB noted that IFRS 17 requires the use of a risk adjustment. In developing the CP, the IPSASB had noted that there were differing views on the appropriateness of a risk adjustment in the context of social benefits:

> 6.42 For some social security schemes, uncertainty regarding future cash flows will be relatively small. An example would be where past experience shows that the level of both contributions received and benefits provided is relatively stable. In these circumstances, information about the best estimate of the entity's liability related to the scheme may be most useful to users of the financial statements.
>
> 6.43 For other social security schemes, there may be significant uncertainty regarding future cash flows. In these circumstances, some consider that the use of the assumption price measurement basis may be more appropriate. They argue that information regarding the risk adjustment applied by the entity may enable users of the financial statements to better evaluate the risks borne by the entity in operating the scheme. Others consider that the use of the assumption price measurement basis is not appropriate for the public sector where there is no third party that might assume the liability. They argue that applying a risk adjustment results in an estimate other than the best estimate of the claims on the entity's resources in regard to the scheme; such an estimate may not be neutral and may therefore not satisfy the qualitative characteristic of faithful representation.

BC152. The IPSASB sought the views of respondents to the CP regarding a risk adjustment. Respondents generally considered that the cost of fulfillment measurement basis, which does not include a risk adjustment, was the most appropriate measurement basis for social benefits.

BC153. In the light of these comments, the publication of IFRS 17 by the IASB, and the decision to direct preparers to apply IFRS 17 (or the relevant national accounting standard) by analogy, the IPSASB revisited its conclusions in the CP.

BC154. The IPSASB acknowledged that the views discussed in the CP were still valid. The IPSASB also accepted that adopting the discount rate included in IPSAS 39, and not including a risk adjustment, would produce greater consistency with social benefit schemes recognized and measured using the general approach. Conversely, retaining the discount rate included in IFRS 17, and retaining the risk adjustment, might result in significantly different amounts being included in the financial statements.

BC155. In addition, the IPSASB considered that amending the requirements of IFRS 17 could only be achieved by undertaking significant due process on that standard, in order to ensure there were no unintended consequences. This would require a significant use of resources, which would defeat the IPSASB's intentions in directing

preparers to apply IFRS 17 (or the relevant national accounting standard) by analogy (see paragraph BC145 above).

BC156. The IPSASB also noted that inconsistencies in the application of discount rates was a wider issue, and that a number of standard setters, including the IASB, were undertaking work on this area.

BC157. Finally, the IPSASB noted that the insurance approach was optional, not a requirement (although, as noted in paragraph BC132 above, this might be subject to review at a later date). An entity that considered the use of different discount rates problematic could elect to account for all its social benefit schemes using the general approach.

BC158. For these reasons, the IPSASB agreed not to amend the requirements in IFRS 17 when applying that standard by analogy to social benefit schemes in ED 63.

Responses to ED 63, *Social Benefits*

BC159. Respondents generally agreed with the IPSASB's proposal to direct preparers to IFRS 17 or national standards that have adopted substantially the same principles as IFRS 17.

BC160. However, a minority of respondents considered that additional guidance on applying the insurance approach to social benefits would be helpful. In particular, these respondents considered that the IPSASB should provide guidance on discount rates and risk adjustments for social benefits, as these might be different than for commercial insurance contracts.

BC161. The IPSASB accepted that providing guidance on discount rates and risk adjustments for social benefits might assist preparers to apply the insurance approach. However, for the reasons given in paragraphs BC154–BC158 above, the IPSASB agreed not to amend the requirements in IFRS 17 when applying that standard by analogy to social benefit schemes.

BC162. The IPSASB noted that entities would need to consider the requirements relating to discount rates and risk adjustments carefully. In particular, the risk adjustment is an entity specific adjustment, and entities will need to consider their unique circumstances in determining the risk adjustment.

BC163. The IPSASB also noted that some national standard setters are considering how the requirements in IFRS 17 (or national standards on insurance) in respect of discount rates and risk adjustments can be applied to social benefits and similar public sector specific transactions. The IPSASB considered that it would be appropriate for entities to consider such guidance once it becomes available.

Revision of IPSAS 42 as a result of COVID-19: *Deferral of Effective Dates*

BC164. The IPSASB published IPSAS 42, *Social Benefits* in January 2019. At the time this Standard was finalized, the Board decided that an entity shall apply it for annual financial statements covering periods beginning on or after January 1, 2022.

BC165. In June 2020, the IPSASB discussed the effect of the COVID-19 pandemic on financial reporting. The Board noted that the pandemic has created significant pressures on the resources public sector entities might otherwise allocate to the implementation of IPSAS 42.

BC166. The Board concluded that deferral during a time of significant disruption would provide much-needed operational relief to public sector entities. Therefore, the Board decided to propose a one-year deferral of the effective date of IPSAS 42.

BC167. The Board did not propose any changes to the Standard other than the deferral of the effective date. Earlier application of the amendments will continue to be permitted.

Revision of IPSAS 42 as a result of IPSAS 46, *Measurement*

BC168. The IPSASB issued IPSAS 46, *Measurement*, in May 2023. That Standard provides guidance on measuring liabilities at the cost of fulfillment, which is relevant to measuring the liability for social benefits under the general approach. That guidance includes a requirement that a risk adjustment is considered in estimating the cost of fulfillment. Generally, this is not expected to affect the measurement of the liability under the general approach given the short-term nature of most social benefit liabilities.

BC169. While the guidance on measuring liabilities at cost of fulfillment is not expected to change the measurement of liabilities for social benefits under the general approach in the majority of cases, the IPSASB agreed to amend Illustrative Examples 9 and 10 to avoid references to using information about payments made after the reporting date, which might conflict with the guidance in IPSAS 46. The IPSASB noted that the provisions in other IPSAS regarding materiality would allow entities to use information about payments made after the reporting date where the effect of doing so was not materially different from using estimates made at the reporting date.

Implementation Guidance

This guidance accompanies, but is not part of, IPSAS 42.

IG1. The purpose of this Implementation Guidance is to illustrate certain aspects of the requirements of IPSAS 42.

Scope of IPSAS 42

IG2. The following diagram illustrates the scope of IPSAS 42 and the boundaries between social benefits and other transactions.

	Transfer Expenses (IPSAS 48)	Provisions (IPSAS 19)		Social Benefits (IPSAS 42)	Other IPSAS/IFRS		
Category	**Transfer Expenses**	**Collective Services**	**Individual Services**	**Social Benefits**	**Employee Benefits**	**Contracts for Insurance**	**Contracts for Goods and Services**
Examples	Transfers to other public sector entities Transfers to charities	Defense Street lighting	Education Healthcare	State pensions Unemployment benefits Income support	Employee pensions Healthcare Salaries	Vehicle insurance Private medical insurance	Purchase of goods Payment for services
Exchange or Non-Exchange Type Transaction?	Non-Exchange	Non-Exchange	Non-Exchange	Non-Exchange	Exchange	Exchange	Exchange
Provided as cash transfers to specific individuals/ households	Sometimes	No	No	Yes	Sometimes	No	No
Provided to specific individuals/households who meet eligibility criteria?	Sometimes	No	Sometimes	Yes	Yes	No	No
Mitigates effect of social risks?	Sometimes	No	Sometimes	Yes	Yes	No	No
Addresses needs of society as a whole?	Sometimes	Yes	Yes	Yes	No	No	No
			Scope of Social Benefits in GFS				

Recognition and Measurement of Liabilities and Expenses in IPSAS 42

IG3. **Where a retirement pension is paid monthly in arrears, will the liability at the reporting date be the same as the amount paid in the following month?**

IG4. The liability at the reporting date is unlikely to be exactly the same as the amount paid the following month. The extent of the difference will depend on the circumstances of the retirement benefit. Factors that will affect the extent of the difference include the following:

(a) Timing differences. The payment in the month following the reporting date may include payments that do not form part of the liability at that reporting date. For example, an entity prepares its financial statements as at December 31. If retirement benefits are paid on the 15th of each month, the payment made on

January 15 may include payments made to individuals who reached retirement age between January 1 and January 15. The payments to these individuals will not form part of the liability as at December 31, because, at that date, those individuals had not met the eligibility criteria for the retirement pension.

(b) Incomplete information. The information which is used to calculate payments may be incomplete, and consequently the payment in the following month may not exactly match the liability at the reporting date. For example, payments are usually calculated a number of days prior to the payment being made. Changes in circumstances notified after that date are not reflected in the payment, but are adjusted in subsequent periods.

IG5. In considering the liability to be recognized as at the reporting date, entities may find it helpful to refer to the discussion of materiality in IPSAS 1, *Presentation of Financial Statements.*

IG6. **How do breaks in meeting the eligibility criteria for a social benefit scheme affect the recognition and measurement of the liability?**

IG7. For a social benefit scheme that has ongoing eligibility criteria (other than being alive, where this is an eligibility criterion) an individual may alternate between periods when they meet the eligibility criteria for the next social benefit payment, and periods when they do not meet those eligibility criteria. In these circumstances, each instance of an individual satisfying the eligibility criteria is recognized and measured separately.

IG8. For example, an entity prepares its financial statements as at December 31. As at that date, an individual was unemployed, and eligible to receive unemployment benefits. Consequently, the entity has a present obligation to the individual at the reporting date. The individual finds temporary employment on January 10 and ceases to be eligible for the unemployment benefits. This employment ends on January 24, when the individual once more becomes eligible for unemployment benefits. Only the first period of unemployment might be included in the liability at the reporting date, as the eligibility criteria for the subsequent period were not satisfied until after that reporting date.

Illustrative Examples

These examples accompany, but are not part of, IPSAS 42

Scope and Definitions

Illustrating the Consequences of Applying Paragraphs 3–5 and AG1–AG10 of IPSAS 42

IE1. The following scenarios illustrate the process for determining whether a transaction is within the scope of IPSAS 42, *Social Benefits.* These scenarios portray hypothetical situations. Although some aspects of the scenarios may be present in actual fact patterns, all facts and circumstances of a particular fact pattern would need to be evaluated when applying IPSAS 42.

Example 1–Provision of Retirement Benefits to Government Employees

IE2. Employees of Province A are entitled, under the terms of their employment contracts, to retirement benefits once they reach the age of 65. The employees are required to contribute a percentage of their salary while they are employed. The retirement benefits provided are based on the final salary of the employees, and their length of service.

IE3. The retirement benefits are cash transfers provided to specific individuals who meet eligibility criteria. The retirement benefits are intended to mitigate social risks, in that they are intended to ensure that the employees have sufficient income once they reach retirement age.

IE4. However, the retirement benefits do not address the needs of society as a whole, as they are only available to former employees of Province A. The retirement benefits are paid as compensation for employment services rendered. It follows that the retirement benefits do not meet all the elements of the definition of a social benefit. Consequently, the retirement benefits are outside the scope of IPSAS 42. The retirement benefits are employee benefits, and are accounted for in accordance with IPSAS 39, *Employee Benefits*.

Example 2–Provision of State Retirement Pension

IE5. Government B pays a minimum state retirement pension to all citizens and residents who have reached the retirement age of 65. The state retirement pension is governed by legislation. Individuals are required to make contributions during their working life, based on their salary. However, the state retirement pension pays the same amount to each retiree regardless of the contributions made.

IE6. The retirement benefits are provided as cash transfers to specific individuals who meet eligibility criteria. The retirement benefits are intended to mitigate social risks, in that they are intended to ensure that individuals and households have sufficient income once they reach retirement age.

IE7. The retirement benefits address the needs of society as a whole. Paragraph AG7 of IPSAS 42 notes that the “assessment of whether a benefit is provided to mitigate the effect of social risks is made by reference to society as a whole; the benefit does not need to mitigate the effect of social risks for each recipient. An example is where a government pays a retirement pension to all those over a certain age, regardless of income or wealth, to ensure that the needs of those whose income after retirement would otherwise be insufficient are met.

IE8. Consequently, the state retirement pension is within the scope of IPSAS 42.

Example 3–Provision of Universal Healthcare Services

IE9. Government C provides basic healthcare services to all its citizens, and to other individuals who meet residency requirements. The healthcare services are provided free at the point of delivery.

IE10. The healthcare services are provided to specific individuals who meet eligibility criteria. The healthcare services are intended to mitigate social risks, in that they are intended to ensure that the welfare of individuals and households is not adversely affected by ill health. In doing so, they address the needs of society as a whole.

IE11. However, Government C is providing services rather than cash transfers. Consequently, the healthcare services are outside the scope of IPSAS 42.

Example 4–Provision of Disability Pensions

IE12. State Government D pays disability pensions to individuals who have a permanent disability that prevents them from working, regardless of their age. A disability pension is only payable after a medical examiner certifies that the disability is permanent, and that the disability will prevent the individual affected from undertaking paid employment. The level of disability pension is dependent on the individual, and is intended to cover basic needs and to allow the individual to pay for an appropriate level of care.

IE13. The disability pensions are provided as cash transfers to specific individuals who meet eligibility criteria. The disability pensions are intended to mitigate the social risk of ill health, in that they are intended to ensure that the welfare of individuals and households is not adversely affected by disability. In doing so, they address the needs of society as a whole.

IE14. Consequently, the disability pensions are within the scope of IPSAS 42.

Example 5–Provision of Unemployment Benefits

IE15. Province E pays unemployment benefits to individuals who are resident in the province and who become unemployed. The unemployment benefits are payable for a maximum of one year, and there is a two week ‘waiting period’ before the unemployment benefits are payable.

IE16. The unemployment benefits are provided as cash transfers to specific individuals who meet eligibility criteria. The unemployment benefits are intended to mitigate social risks, in that they are intended to ensure that individuals and households have sufficient income during periods of unemployment. In doing so, they address the needs of society as a whole.

IE17. Consequently, the unemployment benefits are within the scope of IPSAS 42.

Example 6–Provision of Emergency Relief

IE18. Following an earthquake that has caused significant damage in a region, Government F provides emergency relief to assist with reconstruction and with providing services such as temporary housing to those affected by the earthquake.

IE19. Some costs will relate to providing benefits as cash transfers to specific individuals who meet eligibility criteria. Other costs will relate to the provision of assets and services, for example the reconstruction of roads damaged by the earthquake.

IE20. The provision of assets, such as the reconstruction of roads, or services to specific individuals is not a cash transfer and consequently is outside the scope of IPSAS 42.

IE21. The emergency relief provided as cash transfers does not mitigate the effects of social risks, but instead mitigates the effects of a geographical risk – the risk of earthquake. Paragraph AG10 of IPSAS 42 explains that risks that do not relate to the characteristics of individuals and/or households – for example, risks related to the characteristics of geography or climate, such as the risk of an earthquake or flooding occurring – are not social risks. Consequently, the emergency relief is outside the scope of IPSAS 42.

IE22. Following a natural disaster, individuals and/or households may subsequently become eligible for other benefits, for example unemployment benefits. These benefits may be social benefits if they satisfy the definition of a social benefit (including the requirements that they are cash transfers and they mitigate social risks).

Example 7–Provision of Defense Services

IE23. Government G maintains an army, navy and air force to provide defense for the country.

IE24. These defense services are not cash transfers provided to specific individuals who meet eligibility criteria, but instead are collective services, in that:

(a) They are delivered simultaneously to each member of the community or section of the community; and

(b) Individuals cannot be excluded from the benefits of collective goods and services.

IE25. Consequently, the provision of defense services is outside the scope of IPSAS 42.

General Approach: Recognition and Measurement

Illustrating the Consequences of Applying Paragraphs 6–21 and AG11–AG18 of IPSAS 42

Example 8

IE26. The following example illustrates the process for recognizing and measuring the liability and expense for a retirement pension. This example is not based on actual transactions.

IE27. Government H provides a retirement pension to its citizens and permanent residents. The pension scheme pays a fixed amount of CU250 per month to each individual who has reached the retirement age of 65. Amounts are paid in full to those individuals who satisfied the eligibility criteria in full at the end of the previous month.

IE28. Government H prepares its financial statements as at December 31. Retirement pensions are paid at the end of each month.

IE29. As at December 31, 20X1, Government H recognized a liability for retirement pensions of CU1,950,500. During 20X2, Government H paid retirement pensions as follows:

Month(s)	Pensions Paid (CU)
January 20X2	1,950,500
February–December 20X2	22,258,000
Total	24,208,500

IE30. During January 20X3, Government H pays retirement pensions totaling CU2,095,750.

IE31. As at December 31, 20X2, Government H recognizes a liability for retirement pensions payable to those who satisfied the eligibility criteria at that date. Consequently, Government H recognizes a liability of CU2,095,750, the full amount of the retirement pensions paid in January.

IE32. During 20X2, the total amount recognized as an expense is CU24,353,750. The breakdown of this amount is as follows:

	CU
Pensions paid in February 20X2 (recognized in January 20X2) to December 20X2 (recognized in November 20X2)	22,258,000
Pensions paid in January 20X3 (recognized in December 20X2)	2,095,750
Total	24,353,750

Example 9

IE33. The following example illustrates the process for recognizing and measuring the liability and expense for a retirement pension. This example is not based on actual transactions.

IE34. Government I provides a retirement pension to its citizens and permanent residents. The pension scheme pays a fixed amount of CU100 per month (in arrears) to each individual who has reached the retirement age of 70. Amounts are pro-rated in the months in which an individual reaches the retirement age, and in the months in which an individual dies.

IE35. Government I prepares its financial statements as at December 31. Retirement pensions are paid at the end of each month.

IE36. As at December 31, 20X7, Government I recognized a liability for retirement pensions of CU2,990,656. During 20X8, Government I paid retirement pensions as follows:

Month(s)	**Pensions Paid (CU)**
January 20X8	3,024,997
February–December 20X8	33,435,183
Total	36,460,180

IE37. In this example, it is assumed that there is no difference between the estimates Government I used in recognizing the liability and the actual amount of pensions paid. Consequently, the difference between the amount paid in January 20X8 (CU3,024,997) and the liability recognized as at December 31, 20X7 (CU2,990,656) represents the pro-rated retirement pensions paid to those who reached retirement age during January 20X8 (CU34,341).

IE38. On December 31, 20X8, Government I recognizes a liability for retirement payable to those who satisfied the eligibility criteria at that date. Government I estimates that, on January 31, 20X9, it will pay retirement pensions totaling CU3,053,576. There are three elements to this estimate as follows:

	CU
Full pensions paid to those pensioners eligible at December 31, 20X8 and remaining eligible at January 31, 20X9	2,979,600
Pro-rated pensions paid to those pensioners eligible at December 31, 20X8 who died during January 20X9	36,420
Pro-rated pensions paid to those who reached retirement age during January 20X9	37,556
Total	3,053,576

IE39. [Deleted]

IE40. Consequently, Government I recognizes a liability of CU3,016,020. This includes the full pensions that will be paid to those pensioners eligible at December 31, 20X8 and who are estimated to remain eligible at January 31, 20X9 (CU2,979,600) and the pro-rated pensions that will be paid to those pensioners eligible at December 31 who are estimated to die during January 20X9 (CU36,420). The liability does not include the pro-rated pensions that will be paid to those who are estimated to reach retirement age during January 20X9 because they had not satisfied the eligibility criteria as at December 31, 20X8.

IE41. During 20X8, the total amount recognized as an expense is CU36,485,544. The breakdown of this amount is as follows:

	CU
Pro-rated pensions paid to those who reached retirement age during January 20X8 (recognized in January 20X8)	34,341
Pensions paid between February 20X8 and December 20X8 and recognized in the financial year January 1, 20X8 to December 31, 20X8	33,435,183
Full pensions paid to those pensioners eligible at December 31, 20X8 and estimated to remain eligible at January 31, 20X9 (recognized in December 20X8)	2,979,600
Pro-rated pensions paid to those pensioners eligible at December 31, 20X8 who are estimated to die during January 20X9 (recognized in December 20X8)	36,420
Total	36,485,544

Example 10

IE42. The following example illustrates the process for recognizing and measuring the liability and expense for an unemployment benefit. This example is not based on actual transactions.

IE43. State Government J provides unemployment benefits to its citizens and permanent residents. The unemployment benefit scheme pays monthly amounts of 50% of an individual's previous salary, to a maximum of CU500 per month (in arrears). Unemployment benefits are payable for a maximum of eighteen months. To be eligible to receive benefits, an individual must have been in paid employment in the State for at least 100 days in the past twelve months. Eligibility commences fourteen days after the individual last worked. Amounts are pro-rated in the months in which an individual first meets the eligibility criteria, and in the months in which an individual's eligibility comes to an end (finding paid employment, becoming self-employed, expiry of the eighteen month maximum period, moving out of the State or dying).

IE44. State Government J prepares its financial statements as at June 30. Unemployment benefits are paid on the 15th day of each month.

IE45. As at June 30, 20X1, State Government J recognized a liability for unemployment benefits of CU125,067. During the financial year July 1, 20X1–June 30, 20X2, State Government J paid unemployment benefits as follows:

Month	**Unemployment Benefits Paid (CU)**
July 20X1	129,745
August 20X1–June 20X2	1,582,131
Total	1,711,876

IE46. In this example, it is assumed that there is no difference between the estimates State Government J used in recognizing the liability and the actual amount of unemployment benefits paid. Consequently, the difference between the amount paid on July 15, 20X1 (CU129,745) and the liability recognized as at June 30 20X1 (CU125,067) represents the pro-rated unemployment benefit paid to those who became eligible for unemployment benefits between July 1, 20X1 and July 15, 20X1 (CU4,678).

IE47. On June 30, 20X2, State Government J recognizes a liability for unemployment benefits payable to those who satisfied the eligibility criteria at that date. State Government J estimates that, on July 15, 20X2, it will pay unemployment benefits totaling CU132,952. There are four elements to this estimate as follows:

	CU
Unemployment benefits to be paid to unemployed persons eligible at June 15, 20X2 and are estimated to remain eligible at July 15, 20X2	113,120
Pro-rated unemployment benefits to be paid to those unemployed persons eligible at June 15, 20X2 whose eligibility was estimated to come to an end by July 15, 20X2	9,975
Pro-rated unemployment benefits to be paid to those unemployed persons who became eligible between June 15, 20X2 and June 30, 20X2	5,045
Pro-rated unemployment benefits to be paid to those unemployed persons who were estimated to become eligible between July 1, 20X2 and July 15, 20X2	4,812
Total	132,952

IE48. [Deleted]

IE49. Consequently, State Government J recognizes a liability of CU128,140. This includes:

(a) The unemployment benefits that will be paid to those unemployed persons eligible at June 15, 20X2 and who are estimated to remain eligible at July 15, 20X2 (CU113,120);

(b) The pro-rated unemployment benefits that will be paid to those unemployed persons eligible at June 15, 20X2 whose eligibility is estimated to come to an end by July 15, 20X2 (CU9,975); and

(c) The pro-rated unemployment benefits that will be paid to those unemployed persons who are estimated to become eligible between June 15, 20X2 and June 30, 20X2 (CU5,045).

IE50. The liability does not include the pro-rated unemployment benefits that will be paid to those who are estimated to become eligible between July 1, 20X2 and July 15, 20X2 because they had not satisfied the eligibility criteria as at June 30, 20X2.

IE51. During the financial year July 1, 20X1–June 30, 20X2, the total amount recognized as an expense is CU1,714,949. The breakdown of this amount is as follows:

	CU
Pro-rated unemployment benefits paid in July 20X1 to those who became eligible between July 1, 20X1 and July 15, 20X1 (recognized in July 20X1)	4,678
Unemployment benefits paid in between August 20X1 and June 20X2 and recognized in the financial year July 1, 20X1–June 30, 20X2	1,582,131
Unemployment benefits estimated to be paid in July 20X2 to unemployed persons eligible at June 15, 20X2, both those estimated to remain eligible and those whose	128,140

	CU
eligibility is estimated to come to an end by July 15, 20X2; and those unemployed persons who became eligible between June 15, 20X2 and June 30, 20X2 (recognized in June 20X2)	1,714,949

COMPARISON WITH GFS

In developing IPSAS 42, *Social Benefits*, the IPSASB considered Government Finance Statistics (GFS) reporting guidelines.

Key similarities and differences with GFS are as follows:

- IPSAS 42 uses similar concepts as GFS. For example, the concept of “social risk” in GFS is a defined term in IPSAS 42 that underpins the definition of social benefits.
- IPSAS 42 adopts a narrower definition of social benefits than GFS. IPSAS 42 limits its definition of social benefits to cash transfers (including cash equivalents). Under GFS, social benefits can be provided in cash or in kind (for example, health services).
- Under IPSAS 42, an entity recognizes a liability for the cash transfers that the entity will make until the next point at which eligibility criteria are required to be satisfied. Generally, no such liability is recognized in GFS for social benefits although liabilities are recorded for funded social insurance schemes.
- IPSAS 42 permits relevant social benefits to be recognized and measured using the insurance approach. GFS does not include this option.
- IPSAS 42 includes disclosure requirements that are not present in GFS.

IPSAS 43, *LEASES*

History of IPSAS Accounting Standard

This version includes amendments resulting from IPSAS Accounting Standards issued up to January 31, 2026.

IPSAS 43, *Leases* was issued in January 2022.

Since then, IPSAS 43 has been amended by the following IPSAS Accounting Standards:

- IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards* (issued November 2025)
- *Amendments to IPSAS Standards: Specific IFRIC Interpretations* (issued January 2025)
- *Concessionary Leases and Other Arrangements Conveying Rights over Assets* (issued October 2024)
- *Improvements to IPSAS, 2023* (issued April 2024)
- IPSAS 47, *Revenue* (issued May 2023)
- IPSAS 46, *Measurement* (issued May 2023)
- IPSAS 45, *Property, Plant, and Equipment* (issued May 2023)
- IPSAS 44, *Non-current Assets Held for Sale and Discontinued Operations* (issued May 2022)

Table of Amended Paragraphs in IPSAS 43

Comparison with IFRS 16

Comparison with GFS

International Public Sector Accounting Standard 43, *Leases*, is set out in paragraphs 1–127. All the paragraphs have equal authority. IPSAS 43 should be read in the context of its objective, the Basis for Conclusions, the *Preface to IPSAS Accounting Standards and IPSASB SRS Standards*, and *The Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities*. IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*, provides a basis for selecting and applying accounting policies in the absence of explicit guidance.

Objective

1. **This Standard sets out the principles for the recognition, measurement, presentation and disclosure of leases. The objective is to ensure that lessees and lessors provide relevant information in a manner that faithfully represents those transactions. This information gives a basis for users of financial statements to assess the effect that leases have on the financial position, financial performance and cash flows of an entity.**

2. An entity shall consider the terms and conditions of contracts and all relevant facts and circumstances when applying this Standard. An entity shall apply this Standard consistently to contracts with similar characteristics and in similar circumstances.

Scope

3. An entity shall apply this Standard to all leases, including leases of right-of-use assets in a sublease, except for:

   (a) Leases to explore for or use minerals, oil, natural gas and similar non-regenerative resources;

   (b) Leases of biological assets within the scope of IPSAS 27, *Agriculture* held by a lessee;

   (c) Service concession arrangements within the scope of IPSAS 32, *Service Concession Arrangements: Grantor*; and

   (d) Rights held by a lessee under licensing agreements within the scope of IPSAS 31, *Intangible Assets* for such items as motion picture films, video recordings, plays, manuscripts, patents and copyrights.

4. A lessee may, but is not required to, apply this Standard to leases of intangible assets other than those described in paragraph 3(d).

Definitions

5. **The following terms are used in this Standard with the meanings specified:**

   The commencement date of the lease (commencement date) is the date on which a lessor makes an underlying asset available for use by a lessee.

   A contract, for the purpose of this Standard, is an agreement between two or more parties that creates enforceable rights and obligations.

   Economic life is either:

   (a) **The period over which an asset is expected to be economically usable by one or more users; or**

   (b) **The number of production or similar units expected to be obtained from an asset by one or more users.**

   The effective date of the modification is the date when both parties agree to a lease modification.

   Fair value, for the purpose of applying the lessor accounting requirements in this Standard, is the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction.

   Finance lease is a lease that transfers substantially all the risks and rewards incidental to ownership of an underlying asset.

   Fixed payments are payments made by a lessee to a lessor for the right to use an underlying asset during the lease term, excluding variable lease payments.

Gross investment in the lease is the sum of:

(a) **The lease payments receivable by a lessor under a finance lease; and**

(b) **Any unguaranteed residual value accruing to the lessor.**

The inception date of the lease (inception date) is the earlier of the date of a lease agreement and the date of commitment by the parties to the principal terms and conditions of the lease.

Initial direct costs are incremental costs of obtaining a lease that would not have been incurred if the lease had not been obtained.

The interest rate implicit in the lease is the rate of interest that causes the present value of (a) the lease payments and (b) the unguaranteed residual value to equal the sum of (i) the fair value of the underlying asset and (ii) any initial direct costs of the lessor.

A lease is a contract, or part of a contract, that conveys the right to use an asset (the underlying asset) for a period of time in exchange for consideration.

Lease incentives are payments made by a lessor to a lessee associated with a lease, or the reimbursement or assumption by a lessor of costs of a lessee.

Lease modification is a change in the scope of a lease, or the consideration for a lease, that was not part of the original terms and conditions of the lease (for example, adding or terminating the right to use one or more underlying assets, or extending or shortening the contractual lease term).

Lease payments are payments made by a lessee to a lessor relating to the right to use an underlying asset during the lease term, comprising the following:

(a) **Fixed payments (including in-substance fixed payments), less any lease incentives;**

(b) **Variable lease payments that depend on an index or a rate;**

(c) **The exercise price of a purchase option if the lessee is reasonably certain to exercise that option; and**

(d) **Payments of penalties for terminating the lease, if the lease term reflects the lessee exercising an option to terminate the lease.**

For the lessee, lease payments also include amounts expected to be payable by the lessee under residual value guarantees. Lease payments do not include payments allocated to non-lease components of a contract, unless the lessee elects to combine non-lease components with a lease component and to account for them as a single lease component.

For the lessor, lease payments also include any residual value guarantees provided to the lessor by the lessee, a party related to the lessee or a third party unrelated to the lessor that is financially capable of discharging the obligations under the guarantee. Lease payments do not include payments allocated to non-lease components.

The lease term is the non-cancellable period for which a lessee has the right to use an underlying asset, together with both:

(a) **Periods covered by an option to extend the lease if the lessee is reasonably certain to exercise that option; and**

(b) **Periods covered by an option to terminate the lease if the lessee is reasonably certain not to exercise that option.**

A lessee is an entity that obtains the right to use an underlying asset for a period of time in exchange for consideration.

The lessee's incremental borrowing rate is the rate of interest that a lessee would have to pay to borrow over a similar term, and with a similar security, the funds necessary to obtain an asset of a similar value to the right-of-use asset in a similar economic environment.

A lessor is an entity that provides the right to use an underlying asset for a period of time in exchange for consideration.

Net investment in the lease is the gross investment in the lease discounted at the interest rate implicit in the lease.

Operating lease is a lease that does not transfer substantially all the risks and rewards incidental to ownership of an underlying asset.

Optional lease payments are payments to be made by a lessee to a lessor for the right to use an underlying asset during periods covered by an option to extend or terminate a lease that are not included in the lease term.

Period of use is the total period of time that an asset is used to fulfill a contract with a customer (including any non-consecutive periods of time).

The residual value guarantee is a guarantee made to a lessor by a party unrelated to the lessor that the value (or part of the value) of an underlying asset at the end of a lease will be at least a specified amount.

A right-of-use asset is an asset that represents a lessee's right to use an underlying asset for the lease term.

A short-term lease is a lease that, at the commencement date, has a lease term of 12 months or less. A lease that contains a purchase option is not a short-term lease.

A sublease is a transaction for which an underlying asset is re-leased by a lessee ('intermediate lessor') to a third party, and the lease ('head lease') between the head lessor and lessee remains in effect.

Underlying asset is an asset that is the subject of a lease, for which the right to use that asset has been provided by a lessor to a lessee.

Unearned finance revenue is the difference between:

(a) **The gross investment in the lease; and**

(b) **The net investment in the lease.**

Unguaranteed residual value is that portion of the residual value of the underlying asset, the realization of which by a lessor is not assured or is guaranteed solely by a party related to the lessor.

Variable lease payments are the portion of payments made by a lessee to a lessor for the right to use an underlying asset during the lease term that varies because of changes in facts or circumstances occurring after the commencement date, other than the passage of time.

Terms defined in other IPSAS are used in this Standard with the same meaning as in those Standards and are reproduced in the *Glossary of Defined Terms* published separately. The defined term useful life is used in this Standard with the same meaning as in IPSAS 45, *Property, Plant, and Equipment*.

Recognition Exemptions (see paragraphs AG4–AG9)

6. A lessee may elect not to apply the requirements in paragraphs 18A–18D and 23–52 to:

   (a) Short-term leases; and

   (b) Leases for which the underlying asset is of low value (as described in paragraphs AG4–AG9).

7. If a lessee elects not to apply the requirements in paragraphs 23–52 to either short-term leases or leases for which the underlying asset is of low value, the lessee shall recognize the lease payments associated with those leases as an expense on either a straight-line basis over the lease term or another systematic basis. The lessee shall apply another systematic basis if that basis is more representative of the pattern of the lessee's benefit.

8. If a lessee accounts for short-term leases applying paragraph 7, the lessee shall consider the lease to be a new lease for the purposes of this Standard if:

   (a) There is a lease modification; or

   (b) There is any change in the lease term (for example, the lessee exercises an option not previously included in its determination of the lease term).

9. The election for short-term leases shall be made by class of underlying asset to which the right of use relates. A class of underlying asset is a grouping of underlying assets of a similar nature and use in an entity's operations. The election for leases for which the underlying asset is of low value can be made on a lease-by-lease basis.

Identifying a Lease (see paragraphs AG10–AG34, and AG60–AG62)

10. **At inception of a contract, an entity shall assess whether the contract is, or contains, a lease. A contract is, or contains, a lease if the contract conveys the right to control the use of an identified asset for a period of time in exchange for consideration. Paragraphs AG10–AG32 set out guidance on the assessment of whether a contract is, or contains, a lease.**

11. A period of time may be described in terms of the amount of use of an identified asset (for example, the number of production units that an item of equipment will be used to produce).

12. An entity shall reassess whether a contract is, or contains, a lease only if the terms and conditions of the contract are changed.

Separating Components of a Contract

13. For a contract that is, or contains, a lease, an entity shall account for each lease component within the contract as a lease separately from non-lease components of the contract, unless the entity applies the practical expedient in paragraph 16. Paragraphs AG33–AG34 set out guidance on separating components of a contract.

Lessee

14. For a contract that contains a lease component and one or more additional lease or non-lease components, a lessee shall allocate the consideration in the contract to each lease component on the basis of the relative stand-alone price of the lease component and the aggregate stand-alone price of the non-lease components.

15. The relative stand-alone price of lease and non-lease components shall be determined on the basis of the price the lessor, or a similar supplier, would charge an entity for that component, or a similar component, separately. If an observable stand-alone price is not readily available, the lessee shall estimate the stand-alone price, maximizing the use of observable information.

16. As a practical expedient, a lessee may elect, by class of underlying asset, not to separate non-lease components from lease components, and instead account for each lease component and any associated non-lease components as a single lease component. A lessee shall not apply this practical expedient to embedded derivatives that meet the criteria in paragraph 49 of IPSAS 41, *Financial Instruments*.

17. Unless the practical expedient in paragraph 16 is applied, a lessee shall account for non-lease components applying other applicable Standards.

Lessor

18. For a contract that contains a lease component and one or more additional lease or non-lease components, a lessor shall allocate the consideration in the contract applying IPSAS 47, *Revenue.*

Assessing Whether the Transaction is at Market Terms or at Below-Market Terms

18A. At inception, an entity will determine whether the transaction is at market terms or at below-market terms.

18B. In certain circumstances, such as when an entity enters into a lease at market terms, the lease is an exchange transaction. In other circumstances, such as when an entity enters into a lease at below-market terms, the lease is a concessionary lease. In this case, the lease has a concession component. In determining whether a lease has an identifiable concession component on initial recognition, professional judgment is exercised.

18C. As concessionary leases are granted or received at below-market terms, the present value of contractual payments (consideration) on initial recognition of the lease will be lower than the present value of payments for the lease at market rates based on the current use of the underlying asset.

18D. At inception, a:

(a) Lessee assesses the substance of the concessionary lease by applying the principles in this Standard and paragraphs AG153A–AG153B of IPSAS 47; and

(b) Lessor assesses the substance of the concessionary lease by applying the principles in this Standard.

Lease Term (see paragraphs AG35–AG42)

19. An entity shall determine the lease term as the non-cancellable period of a lease, together with both:

(a) Periods covered by an option to extend the lease if the lessee is reasonably certain to exercise that option; and

(b) Periods covered by an option to terminate the lease if the lessee is reasonably certain not to exercise that option.

20. In assessing whether a lessee is reasonably certain to exercise an option to extend a lease, or not to exercise an option to terminate a lease, an entity shall consider all relevant facts and circumstances that create an economic incentive for the lessee to exercise the option to extend the lease, or not to exercise the option to terminate the lease, as described in paragraphs AG38–AG41.

21. A lessee shall reassess whether it is reasonably certain to exercise an extension option, or not to exercise a termination option, upon the occurrence of either a significant event or a significant change in circumstances that:

(a) Is within the control of the lessee; and

(b) Affects whether the lessee is reasonably certain to exercise an option not previously included in its determination of the lease term, or not to exercise an option previously included in its determination of the lease term (as described in paragraph AG42).

22. An entity shall revise the lease term if there is a change in the non-cancellable period of a lease. For example, the non-cancellable period of a lease will change if:

(a) The lessee exercises an option not previously included in the entity's determination of the lease term;

(b) The lessee does not exercise an option previously included in the entity's determination of the lease term;

(c) An event occurs that contractually obliges the lessee to exercise an option not previously included in the entity's determination of the lease term; or

(d) An event occurs that contractually prohibits the lessee from exercising an option previously included in the entity's determination of the lease term.

Lessee

Recognition

23. **At the commencement date, a lessee shall recognize a right-of-use asset and a lease liability.**

Measurement

Initial Measurement

Initial Measurement of the Right-of-Use Asset

24. **At the commencement date, a lessee shall measure the right-of-use asset at cost.**

25. The cost of the right-of-use asset shall comprise:

(a) The amount of the initial measurement of the lease liability, as described in paragraph 27;

(b) Any lease payments made at or before the commencement date, less any lease incentives received;

(c) Any initial direct costs incurred by the lessee; and

(d) An estimate of costs to be incurred by the lessee in dismantling and removing the underlying asset, restoring the site on which it is located or restoring the underlying asset to the condition required by the terms and conditions of the lease, unless those costs are incurred to produce inventories. The lessee incurs the obligation for those costs either at the commencement date or as a consequence of having used the underlying asset during a particular period.

26. A lessee shall recognize the costs described in paragraph 25(d) as part of the cost of the right-of-use asset when it incurs an obligation for those costs. A lessee applies IPSAS 12, *Inventories* to costs that are incurred during a particular period as a consequence of having used the right-of-use asset to produce inventories during that period. The obligations for such costs accounted for applying this Standard or IPSAS 12 are recognized and measured applying IPSAS 19, *Provisions, Contingent Liabilities, and Contingent Assets*.

26A. **Where a right-of-use asset is acquired through a concessionary lease, its cost shall be measured at the present value of payments for the lease at market rates based on the current use of the underlying asset as at the commencement date.**

26B. The payments for the lease at market rates based on the current use of the underlying asset shall be discounted using the interest rates identified in paragraph 27. The cost of the right-of-use asset shall also include the items identified in paragraphs 25(c) and 25(d).

26C. A lessee shall make a reasonable level of effort in determining the present value of payments for the lease at market rates based on the current use of the underlying asset. If payments for the lease at market rates

based on the current use of the underlying asset are not readily available for the right-of-use asset, the lessee shall measure the right-of-use asset in a concessionary lease in accordance with paragraphs 24–26.

Initial Measurement of the Lease Liability

27. **At the commencement date, a lessee shall measure the lease liability at the present value of the lease payments that are not paid at that date. The lease payments shall be discounted using the interest rate implicit in the lease, if that rate can be readily determined. If that rate cannot be readily determined, the lessee shall use the lessee's incremental borrowing rate.**

28. At the commencement date, the lease payments included in the measurement of the lease liability comprise the following payments for the right to use the underlying asset during the lease term that are not paid at the commencement date:

    (a) Fixed payments (including in-substance fixed payments as described in paragraph AG43), less any lease incentives receivable;

    (b) Variable lease payments that depend on an index or a rate, initially measured using the index or rate as at the commencement date (as described in paragraph 29);

    (c) Amounts expected to be payable by the lessee under residual value guarantees;

    (d) The exercise price of a purchase option if the lessee is reasonably certain to exercise that option (assessed considering the factors described in paragraphs AG38–AG41); and

    (e) Payments of penalties for terminating the lease, if the lease term reflects the lessee exercising an option to terminate the lease.

29. Variable lease payments that depend on an index or a rate described in paragraph 28(b) include, for example, payments linked to a consumer price index, payments linked to a benchmark interest rate (such as LIBOR) or payments that vary to reflect changes in market rental rates.

29A. **Where a lease liability is recognized through a concessionary lease, its cost shall be measured in accordance with paragraphs 27–29.**

Subsequent Measurement

Subsequent Measurement of the Right-of-Use Asset

30. **After the commencement date, a lessee shall measure the right-of-use asset applying a cost model, unless it applies either of the measurement models described in paragraphs 35 and 36. If an entity's initial measurement of a right-of-use asset included an estimate of costs to be incurred by the lessee in dismantling and removing the underlying asset, or restoring the site or underlying asset under paragraph 25(d), for which it recognized a corresponding liability in accordance with IPSAS 19, *Provisions, Contingent Liabilities and Contingent Assets*, the entity shall also apply Appendix B of IPSAS 19 in its subsequent measurement of the item.**

Historical Cost Model

31. To apply a historical cost model, a lessee shall measure the right-of-use asset at cost:

    (a) Less any accumulated depreciation and any accumulated impairment losses; and

    (b) Adjusted for any remeasurement of the lease liability specified in paragraph 37(c).

32. A lessee shall apply the depreciation requirements in IPSAS 45 in depreciating the right-of-use asset, subject to the requirements in paragraph 33.

33. If the lease transfers ownership of the underlying asset to the lessee by the end of the lease term or if the cost of the right-of-use asset reflects that the lessee will exercise a purchase option, the lessee shall depreciate the right-of-use asset from the commencement date to the end of the useful life of the underlying asset. Otherwise, the lessee shall depreciate the right-of-use asset from the commencement date to the earlier of the end of the useful life of the right-of-use asset or the end of the lease term.

34. A lessee shall apply IPSAS 21, *Impairment of Non-Cash-Generating Assets* or IPSAS 26, *Impairment of Cash-Generating Assets,* as appropriate, to determine whether the right-of-use asset is impaired and to account for any impairment loss identified.

Other Measurement Models

35. If a lessee applies the fair value measurement basis in the current value model in IPSAS 16, *Investment Property* to its investment property, the lessee shall also apply that fair value measurement basis to right-of-use assets that meet the definition of investment property in IPSAS 16.

36. If right-of-use assets relate to a class of property, plant, and equipment to which the lessee applies the current value model in IPSAS 45, a lessee may elect to apply that current value model to all of the right-of-use assets that relate to that class of property, plant, and equipment.

Subsequent Measurement of the Lease Liability

37. **After the commencement date, a lessee shall measure the lease liability by:**

    (a) **Increasing the carrying amount to reflect interest on the lease liability;**

    (b) **Reducing the carrying amount to reflect the lease payments made; and**

    (c) **Remeasuring the carrying amount to reflect any reassessment or lease modifications specified in paragraphs 40–47, or to reflect revised in-substance fixed lease payments (see paragraph AG43).**

38. Interest on the lease liability in each period during the lease term shall be the amount that produces a constant periodic rate of interest on the remaining balance of the lease liability. The periodic rate of interest is the discount rate described in paragraph 27, or if applicable the revised discount rate described in paragraph 42, paragraph 44 or paragraph 46(c).

39. After the commencement date, a lessee shall recognize in surplus or deficit, unless the costs are included in the carrying amount of another asset applying other applicable Standards, both:

    (a) Interest on the lease liability; and

    (b) Variable lease payments not included in the measurement of the lease liability in the period in which the event or condition that triggers those payments occurs.

Reassessment of the Lease Liability

40. After the commencement date, a lessee shall apply paragraphs 41–44 to remeasure the lease liability to reflect changes to the lease payments. A lessee shall recognize the amount of the remeasurement of the lease liability as an adjustment to the right-of-use asset. However, if the carrying amount of the right-of-use asset is reduced to zero and there is a further reduction in the measurement of the lease liability, a lessee shall recognize any remaining amount of the remeasurement in surplus or deficit.

41. A lessee shall remeasure the lease liability by discounting the revised lease payments using a revised discount rate, if either:

    (a) There is a change in the lease term, as described in paragraphs 21–22. A lessee shall determine the revised lease payments on the basis of the revised lease term; or

(b) There is a change in the assessment of an option to purchase the underlying asset, assessed considering the events and circumstances described in paragraphs 21–22 in the context of a purchase option. A lessee shall determine the revised lease payments to reflect the change in amounts payable under the purchase option.

42. In applying paragraph 41, a lessee shall determine the revised discount rate as the interest rate implicit in the lease for the remainder of the lease term, if that rate can be readily determined, or the lessee's incremental borrowing rate at the date of reassessment, if the interest rate implicit in the lease cannot be readily determined.

43. A lessee shall remeasure the lease liability by discounting the revised lease payments, if either:

(a) There is a change in the amounts expected to be payable under a residual value guarantee. A lessee shall determine the revised lease payments to reflect the change in amounts expected to be payable under the residual value guarantee.

(b) There is a change in future lease payments resulting from a change in an index or a rate used to determine those payments, including for example a change to reflect changes in market rental rates following a market rent review. The lessee shall remeasure the lease liability to reflect those revised lease payments only when there is a change in the cash flows (i.e., when the adjustment to the lease payments takes effect). A lessee shall determine the revised lease payments for the remainder of the lease term based on the revised contractual payments.

44. In applying paragraph 43, a lessee shall use an unchanged discount rate, unless the change in lease payments results from a change in floating interest rates. In that case, the lessee shall use a revised discount rate that reflects changes in the interest rate.

Lease Modifications

45. A lessee shall account for a lease modification as a separate lease if both:

(a) The modification increases the scope of the lease by adding the right to use one or more underlying assets; and

(b) The consideration for the lease increases by an amount commensurate with the stand-alone price for the increase in scope and any appropriate adjustments to that stand-alone price to reflect the circumstances of the particular contract.

46. For a lease modification that is not accounted for as a separate lease, at the effective date of the lease modification a lessee shall:

(a) Allocate the consideration in the modified contract applying paragraphs 14–17;

(b) Determine the lease term of the modified lease applying paragraphs 19–20; and

(c) Remeasure the lease liability by discounting the revised lease payments using a revised discount rate. The revised discount rate is determined as the interest rate implicit in the lease for the remainder of the lease term, if that rate can be readily determined, or the lessee's incremental borrowing rate at the effective date of the modification, if the interest rate implicit in the lease cannot be readily determined.

47. For a lease modification that is not accounted for as a separate lease, the lessee shall account for the remeasurement of the lease liability by:

(a) Decreasing the carrying amount of the right-of-use asset to reflect the partial or full termination of the lease for lease modifications that decrease the scope of the lease. The lessee shall recognize in surplus or deficit any gain or loss relating to the partial or full termination of the lease.

(b) Making a corresponding adjustment to the right-of-use asset for all other lease modifications.

48. As a practical expedient, a lessee may elect not to assess whether a rent concession that meets the conditions in paragraph 49 is a lease modification. A lessee that makes this election shall account for any change in lease payments resulting from the rent concession the same way it would account for the change applying this Standard if the change were not a lease modification.

49. The practical expedient in paragraph 48 applies only to rent concessions occurring as a direct consequence of the COVID-19 pandemic and only if all of the following conditions are met:

    (a) The change in lease payments results in revised consideration for the lease that is substantially the same as, or less than, the consideration for the lease immediately preceding the change;

    (b) Any reduction in lease payments affects only payments originally due on or before June 30, 2022 (for example, a rent concession would meet this condition if it results in reduced lease payments on or before June 30, 2022 and increased lease payments that extend beyond June 30, 2022); and

    (c) There is no substantive change to other terms and conditions of the lease.

Presentation

50. A lessee shall either present in the statement of financial position, or disclose in the notes:

    (a) Right-of-use assets separately from other assets. If a lessee does not present right-of-use assets separately in the statement of financial position, the lessee shall:

        (i) Include right-of-use assets within the same line item as that within which the corresponding underlying assets would be presented if they were owned; and

        (ii) Disclose which line items in the statement of financial position include those right-of-use assets.

    (b) Lease liabilities separately from other liabilities. If the lessee does not present lease liabilities separately in the statement of financial position, the lessee shall disclose which line items in the statement of financial position include those liabilities.

51. The requirement in paragraph 50(a) does not apply to right-of-use assets that meet the definition of investment property, which shall be presented in the statement of financial position as investment property.

52. In the statement of financial performance, a lessee shall present interest expense on the lease liability separately from the depreciation charge for the right-of-use asset. Interest expense on the lease liability is a component of finance costs, which paragraph 102(b) of IPSAS 1, *Presentation of Financial Statements* requires to be presented separately in the statement of financial performance.

53. In the cash flow statement, a lessee shall classify:

    (a) Cash payments for the principal portion of the lease liability within financing activities;

    (b) Cash payments for the interest portion of the lease liability applying the requirements in IPSAS 2, *Cash Flow Statement* for interest paid; and

    (c) Short-term lease payments, payments for leases of low-value assets and variable lease payments not included in the measurement of the lease liability within operating activities.

Disclosure

54. **The objective of the disclosures is for lessees to disclose information in the notes that, together with the information provided in the statement of financial position, statement of financial performance and cash flow statement, gives a basis for users of financial statements to assess the effect that leases have on the financial position, financial performance and cash flows of the lessee. Paragraphs 55–64A specify requirements on how to meet this objective.**

55. A lessee shall disclose information about its leases for which it is a lessee in a single note or separate section in its financial statements. However, a lessee need not duplicate information that is already presented elsewhere in the financial statements, provided that the information is incorporated by cross-reference in the single note or separate section about leases.

56. A lessee shall disclose the following amounts for the reporting period:

(a) Depreciation charge for right-of-use assets by class of underlying asset;

(b) Interest expense on lease liabilities;

(c) The expense relating to short-term leases accounted for applying paragraph 7. This expense need not include the expense relating to leases with a lease term of one month or less;

(d) The expense relating to leases of low-value assets accounted for applying paragraph 7. This expense shall not include the expense relating to short-term leases of low-value assets included in paragraph 56(c);

(e) The expense relating to variable lease payments not included in the measurement of lease liabilities;

(f) Revenue from subleasing right-of-use assets;

(g) Total cash outflow for leases;

(h) Additions to right-of-use assets;

(i) Gains or losses arising from sale and leaseback transactions; and

(j) The carrying amount of right-of-use assets at the end of the reporting period by class of underlying asset.

57. A lessee shall provide the disclosures specified in paragraph 56 in a tabular format, unless another format is more appropriate. The amounts disclosed shall include costs that a lessee has included in the carrying amount of another asset during the reporting period.

58. A lessee shall disclose the amount of its lease commitments for short-term leases accounted for applying paragraph 7 if the portfolio of short-term leases to which it is committed at the end of the reporting period is dissimilar to the portfolio of short-term leases to which the short-term lease expense disclosed applying paragraph 56(c) relates.

59. If right-of-use assets meet the definition of investment property, a lessee shall apply the disclosure requirements in IPSAS 16. In that case, a lessee is not required to provide the disclosures in paragraph 56(a), 56(f), 56(h) or 56(j) for those right-of-use assets.

60. If a lessee measures right-of-use assets at revalued amounts applying IPSAS 45, the lessee shall disclose the information required by paragraph 74 of IPSAS 45 for those right-of-use assets.

61. A lessee shall disclose a maturity analysis of lease liabilities applying paragraphs 46 and AG12 of IPSAS 30, *Financial Instruments: Disclosures* separately from the maturity analyses of other financial liabilities.

62. In addition to the disclosures required in paragraphs 56–61, a lessee shall disclose additional qualitative and quantitative information about its leasing activities necessary to meet the disclosure objective in paragraph 54 (as described in paragraph AG49). This additional information may include, but is not limited to, information that helps users of financial statements to assess:

(a) The nature of the lessee’s leasing activities;

(b) Future cash outflows to which the lessee is potentially exposed that are not reflected in the measurement of lease liabilities. This includes exposure arising from:

(i) Variable lease payments (as described in paragraph AG50);

(ii) Extension options and termination options (as described in paragraph AG51);

(iii) Residual value guarantees (as described in paragraph AG52); and

(iv) Leases not yet commenced to which the lessee is committed.

(c) Restrictions or covenants imposed by leases; and

(d) Sale and leaseback transactions (as described in paragraph AG53).

63. A lessee that accounts for short-term leases or leases of low-value assets applying paragraph 7 shall disclose that fact.

64. If a lessee applies the practical expedient in paragraph 48, the lessee shall disclose:

(a) That it has applied the practical expedient to all rent concessions that meet the conditions in paragraph 49 or, if not applied to all such rent concessions, information about the nature of the contracts to which it has applied the practical expedient (see paragraph 2); and

(b) The amount recognized in surplus or deficit for the reporting period to reflect changes in lease payments that arise from rent concessions to which the lessee has applied the practical expedient in paragraph 48.

Concessionary Leases

64A. For concessionary leases received, a lessee shall disclose by class of underlying asset:

(a) The amount of the concession on initial recognition;

(b) The amount of the contractual payments for the lease when the payments for the lease at market rates based on the current use of the underlying asset are not readily available;

(c) The purpose and terms of the various types of concessionary leases, including the nature of the concession; and

(d) Significant assumptions used in estimating the present value of the lease payments at market rates based on the current use of the underlying asset.

Lessor

Classification of Leases (see paragraphs AG54–AG60)

65. **A lessor shall classify each of its leases as either an operating lease or a finance lease.**

66. **A lease is classified as a finance lease if it transfers substantially all the risks and rewards incidental to ownership of an underlying asset. A lease is classified as an operating lease if it does not transfer substantially all the risks and rewards incidental to ownership of an underlying asset.**

67. Whether a lease is a finance lease or an operating lease depends on the substance of the transaction rather than the form of the contract. Examples of situations that individually or in combination would normally lead to a lease being classified as a finance lease are:

(a) The lease transfers ownership of the underlying asset to the lessee by the end of the lease term;

(b) The lessee has the option to purchase the underlying asset at a price that is expected to be sufficiently lower than the fair value at the date the option becomes exercisable for it to be reasonably certain, at the inception date, that the option will be exercised;

(c) The lease term is for the major part of the economic life of the underlying asset even if title is not transferred;

(d) At the inception date, the present value of the lease payments amounts to at least substantially all of the fair value of the underlying asset; and

(e) The underlying asset is of such a specialized nature that only the lessee can use it without major modifications.

68. Indicators of situations that individually or in combination could also lead to a lease being classified as a finance lease are:

(a) If the lessee can cancel the lease, the lessor's losses associated with the cancellation are borne by the lessee;

(b) Gains or losses from the fluctuation in the fair value of the residual accrue to the lessee (for example, in the form of a rent rebate equaling most of the sales proceeds at the end of the lease); and

(c) The lessee has the ability to continue the lease for a secondary period at a rent that is substantially lower than market rent.

69. The examples and indicators in paragraphs 67–68 are not always conclusive. If it is clear from other features that the lease does not transfer substantially all the risks and rewards incidental to ownership of an underlying asset, the lease is classified as an operating lease. For example, this may be the case if ownership of the underlying asset transfers at the end of the lease for a variable payment equal to its then fair value, or if there are variable lease payments, as a result of which the lessor does not transfer substantially all such risks and rewards.

70. Lease classification is made at the inception date and is reassessed only if there is a lease modification. Changes in estimates (for example, changes in estimates of the economic life or of the residual value of the underlying asset), or changes in circumstances (for example, default by the lessee), do not give rise to a new classification of a lease for accounting purposes.

Finance Leases (see paragraph AG62(a))

Recognition and Measurement

71. **At the commencement date, a lessor shall recognize assets held under a finance lease in its statement of financial position and present them as a receivable at an amount equal to the net investment in the lease.**

71A. At the commencement date, a lessor shall recognize assets under a concessionary finance lease applying the requirements in this Standard for finance leases.

Initial Measurement

72. The lessor shall use the interest rate implicit in the lease to measure the net investment in the lease. In the case of a sublease, if the interest rate implicit in the sublease cannot be readily determined, an intermediate lessor may use the discount rate used for the head lease (adjusted for any initial direct costs associated with the sublease) to measure the net investment in the sublease.

73. Initial direct costs are included in the initial measurement of the net investment in the lease and reduce the amount of revenue recognized over the lease term. The interest rate implicit in the lease is defined in such a way that the initial direct costs are included automatically in the net investment in the lease; there is no need to add them separately.

Initial Measurement of the Lease Payments Included in the Net Investment in the Lease

74. At the commencement date, the lease payments included in the measurement of the net investment in the lease comprise the following payments for the right to use the underlying asset during the lease term that are not received at the commencement date:

(a) Fixed payments (including in-substance fixed payments as described in paragraph AG43), less any lease incentives payable;

(b) Variable lease payments that depend on an index or a rate, initially measured using the index or rate as at the commencement date;

(c) Any residual value guarantees provided to the lessor by the lessee, a party related to the lessee or a third party unrelated to the lessor that is financially capable of discharging the obligations under the guarantee;

(d) The exercise price of a purchase option if the lessee is reasonably certain to exercise that option (assessed considering the factors described in paragraph AG38); and

(e) Payments of penalties for terminating the lease, if the lease term reflects the lessee exercising an option to terminate the lease.

Subsequent Measurement

75. **A lessor shall recognize finance revenue over the lease term, based on a pattern reflecting a constant periodic rate of return on the lessor's net investment in the lease.**

76. A lessor aims to allocate finance revenue over the lease term on a systematic and rational basis. A lessor shall apply the lease payments relating to the period against the gross investment in the lease to reduce both the principal and the unearned finance revenue.

77. A lessor shall apply the derecognition and impairment requirements in IPSAS 41 to the net investment in the lease. A lessor shall regularly review estimated unguaranteed residual values used in computing the gross investment in the lease. If there has been a reduction in the estimated unguaranteed residual value, the lessor shall revise the revenue allocation over the lease term and recognize immediately any reduction in respect of amounts accrued.

78. A lessor that classifies an asset under a finance lease as held for sale (or includes it in a disposal group that is classified as held for sale) applying IPSAS 44, *Non-current Assets Held for Sale and Discontinued Operations* shall account for the asset in accordance with that Standard.

Lease Modifications

79. A lessor shall account for a modification to a finance lease as a separate lease if both:

(a) The modification increases the scope of the lease by adding the right to use one or more underlying assets; and

(b) The consideration for the lease increases by an amount commensurate with the stand-alone price for the increase in scope and any appropriate adjustments to that stand-alone price to reflect the circumstances of the particular contract.

80. For a modification to a finance lease that is not accounted for as a separate lease, a lessor shall account for the modification as follows:

(a) If the lease would have been classified as an operating lease had the modification been in effect at the inception date, the lessor shall:

(i) Account for the lease modification as a new lease from the effective date of the modification; and

(ii) Measure the carrying amount of the underlying asset as the net investment in the lease immediately before the effective date of the lease modification.

(b) Otherwise, the lessor shall apply the requirements of IPSAS 41.

Operating Leases (see paragraph AG62(b))

Recognition and Measurement

81. **A lessor shall recognize lease payments from operating leases as revenue on either a straight-line basis or another systematic basis. The lessor shall apply another systematic basis if that basis is more representative of the pattern in which benefit from the use of the underlying asset is diminished.**

81A. A lessor shall recognize revenue under a concessionary operating lease applying the requirements in this Standard for operating leases.

82. A lessor shall recognize costs, including depreciation, incurred in earning the lease revenue as an expense.

83. A lessor shall add initial direct costs incurred in obtaining an operating lease to the carrying amount of the underlying asset and recognize those costs as an expense over the lease term on the same basis as the lease revenue.

84. The depreciation policy for depreciable underlying assets subject to operating leases shall be consistent with the lessor's normal depreciation policy for similar assets. A lessor shall calculate depreciation in accordance with IPSAS 31 and IPSAS 45.

85. A lessor shall apply IPSAS 21 or IPSAS 26, as appropriate, to determine whether an underlying asset subject to an operating lease is impaired and to account for any impairment loss identified.

Lease Modifications

86. A lessor shall account for a modification to an operating lease as a new lease from the effective date of the modification, considering any prepaid or accrued lease payments relating to the original lease as part of the lease payments for the new lease.

Presentation

87. A lessor shall present underlying assets subject to operating leases in its statement of financial position according to the nature of the underlying asset.

Disclosure

88. **The objective of the disclosures is for lessors to disclose information in the notes that, together with the information provided in the statement of financial position, statement of financial performance and cash flow statement, gives a basis for users of financial statements to assess the effect that leases have on the financial position, financial performance and cash flows of the lessor. Paragraphs 89–96 specify requirements on how to meet this objective.**

89. A lessor shall disclose the following amounts for the reporting period:

(a) For finance leases:

(i) Selling surplus or deficit;

(ii) Finance revenue on the net investment in the lease; and

(iii) Revenue relating to variable lease payments not included in the measurement of the net investment in the lease.

(b) For operating leases, lease revenue, separately disclosing revenue relating to variable lease payments that do not depend on an index or a rate.

90. A lessor shall provide the disclosures specified in paragraph 89 in a tabular format, unless another format is more appropriate.

91. A lessor shall disclose additional qualitative and quantitative information about its leasing activities necessary to meet the disclosure objective in paragraph 88. This additional information includes, but is not limited to, information that helps users of financial statements to assess:

(a) The nature of the lessor's leasing activities; and

(b) How the lessor manages the risk associated with any rights it retains in underlying assets. In particular, a lessor shall disclose its risk management strategy for the rights it retains in underlying assets, including any means by which the lessor reduces that risk. Such means may include, for example, buy-back agreements, residual value guarantees or variable lease payments for use in excess of specified limits.

Finance Leases

92. A lessor shall provide a qualitative and quantitative explanation of the significant changes in the carrying amount of the net investment in finance leases.

93. A lessor shall disclose a maturity analysis of the lease payments receivable, showing the undiscounted lease payments to be received on an annual basis for a minimum of each of the first five years and a total of the amounts for the remaining years. A lessor shall reconcile the undiscounted lease payments to the net investment in the lease. The reconciliation shall identify the unearned finance revenue relating to the lease payments receivable and any discounted unguaranteed residual value.

Operating Leases

94. For items of property, plant, and equipment subject to an operating lease, a lessor shall apply the disclosure requirements of IPSAS 45. In applying the disclosure requirements in IPSAS 45, a lessor shall disaggregate each class of property, plant, and equipment into assets subject to operating leases and assets not subject to operating leases. Accordingly, a lessor shall provide the disclosures required by IPSAS 45 for assets subject to an operating lease (by class of underlying asset) separately from owned assets held and used by the lessor.

95. A lessor shall apply the disclosure requirements in IPSAS 16, IPSAS 21 or IPSAS 26, as appropriate, IPSAS 27 and IPSAS 31 for assets subject to operating leases.

96. A lessor shall disclose a maturity analysis of lease payments, showing the undiscounted lease payments to be received on an annual basis for a minimum of each of the first five years and a total of the amounts for the remaining years.

Concessionary Finance Leases

96A. For concessionary finance leases granted, a lessor shall disclose by class of underlying asset:

(a) The carrying amount of the underlying assets transferred during the period in accordance with the relevant IPSAS;

(b) The net investment in the lease at the commencement date in accordance with this Standard;

(c) The difference between (a) and (b); and

(d) The purpose and terms of the various types of concessionary finance leases, including the nature of the concession.

Concessionary Operating Leases

96B. For concessionary operating leases granted, a lessor shall disclose by class of underlying asset:

(a) The amount of lease revenue accrued during the period;

(b) The costs associated with the underlying asset incurred on the accrual basis during the period;

(c) The difference between (a) and (b); and

(d) The purpose and terms of the various types of concessionary operating leases, including the nature of the concession.

Sale and Leaseback Transactions

97. If an entity (the seller-lessee) transfers an asset to another entity (the buyer-lessor) and leases that asset back from the buyer-lessor, both the seller-lessee and the buyer-lessor shall account for the transfer contract and the lease applying paragraphs 98–102.

97A. An entity shall assess whether a sale and leaseback transaction contains an embedded concession at the inception of the lease.

97B. If an entity (the seller-lessee and the buyer-lessor) identifies below-market terms embedded in the leaseback transaction as a concession, the seller-lessee shall account for the concession in accordance with IPSAS 47, and the buyer-lessor shall account for the concession in accordance with this Standard. Otherwise, the entity shall account for the below-market terms as prepayments in accordance with paragraph 100(a).

Assessing Whether the Transfer of the Asset is a Sale

98. An entity shall apply the requirements for determining when a compliance obligation is satisfied in IPSAS 47 to determine whether the transfer of an asset is accounted for as a sale of that asset.

Transfer of the Asset is a Sale

99. If the transfer of an asset by the seller-lessee satisfies the requirements of IPSAS 47 to be accounted for as a sale of the asset:

(a) The seller-lessee shall measure the right-of-use asset arising from the leaseback at the proportion of the previous carrying amount of the asset that relates to the right of use retained by the seller-lessee. Accordingly, the seller-lessee shall recognize only the amount of any gain or loss that relates to the rights transferred to the buyer-lessor.

(b) The buyer-lessor shall account for the purchase of the asset applying applicable Standards, and for the lease applying the lessor accounting requirements in this Standard.

100. If the fair value of the consideration for the sale of an asset does not equal the fair value of the asset, or if the payments for the lease are not at market rates, an entity shall make the following adjustments to measure the sale proceeds at fair value:

(a) Any below-market terms shall be accounted for as a prepayment of lease payments; and

(b) Any above-market terms shall be accounted for as additional financing provided by the buyer-lessor to the seller-lessee.

101. The entity shall measure any potential adjustment required by paragraph 100 on the basis of the more readily determinable of:

(a) The difference between the fair value of the consideration for the sale and the fair value of the asset; and

(b) The difference between the present value of the contractual payments for the lease and the present value of payments for the lease at market rates.

101A. After the commencement date, the seller-lessee shall apply paragraphs 30–36 to the right-of-use asset arising from the leaseback and paragraphs 37–47 to the lease liability arising from the leaseback. In applying paragraphs 37–47, the seller-lessee shall determine 'lease payments' or 'revised lease payments' in a way that the seller-lessee would not recognize any amount of the gain or loss that relates to the right of use retained by the seller-lessee. Applying the requirements in this paragraph does not prevent the seller-lessee from recognizing in surplus or deficit any gain or loss relating to the partial or full termination of a lease as required by paragraph 47(a).

Transfer of the Asset is not a Sale

102. If the transfer of an asset by the seller-lessee does not satisfy the requirements of IPSAS 47 to be accounted for as a sale of the asset:

(a) The seller-lessee shall continue to recognize the transferred asset and shall recognize a financial liability equal to the transfer proceeds. It shall account for the financial liability applying IPSAS 41.

(b) The buyer-lessor shall not recognize the transferred asset and shall recognize a financial asset equal to the transfer proceeds. It shall account for the financial asset applying IPSAS 41.

Temporary Exception Arising from Interest Rate Benchmark Reform

102A. A lessee shall apply paragraphs 102B–102C to all lease modifications that change the basis for determining future lease payments as a result of interest rate benchmark reform (see paragraphs 72B and 72D of IPSAS 41). These paragraphs apply only to such lease modifications. For this purpose, the term 'interest rate benchmark reform' refers to the market-wide reform of an interest rate benchmark as described in paragraph 155B of IPSAS 41.

102B. As a practical expedient, a lessee shall apply paragraph 43 to account for a lease modification required by interest rate benchmark reform. This practical expedient applies only to such modifications. For this purpose, a lease modification is required by interest rate benchmark reform if, and only if, both of these conditions are met:

(a) The modification is necessary as a direct consequence of interest rate benchmark reform; and

(b) The new basis for determining the lease payments is economically equivalent to the previous basis (i.e., the basis immediately preceding the modification).

102C. However, if lease modifications are made in addition to those lease modifications required by interest rate benchmark reform, a lessee shall apply the applicable requirements in this Standard to account for all lease modifications made at the same time, including those required by interest rate benchmark reform.

Effective Date and Transition

Effective Date

103. **An entity shall apply this Standard for annual financial statements covering periods beginning on or after January 1, 2025. Earlier application is permitted for entities that apply IPSAS 41, at or before the**

date of initial application of this Standard. If an entity applies this Standard earlier, it shall disclose that fact.

103A. **Paragraph 78 was amended by IPSAS 44 issued in May 2022. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2025. Earlier application is permitted. If an entity applies the amendments for a period beginning before January 1, 2025, it shall disclose that fact and apply IPSAS 44 at the same time.**

103B. **Paragraphs 5, 31, 32, 36, 60, 84, 94, and AG45 were amended by IPSAS 45 issued in May 2023. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2025. Earlier application is encouraged. If an entity applies these amendments for a period beginning before January 1, 2025, it shall disclose that fact and apply IPSAS 45 at the same time.**

103C. **Paragraphs 35 and 113 were amended by IPSAS 46, *Measurement*, issued in May 2023. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2025. Earlier application is encouraged. If an entity applies the amendment for a period beginning before January 1, 2025, it shall disclose that fact and apply IPSAS 46 at the same time.**

103D. **Paragraphs 18, 98, 99, 102, and 120 were amended by IPSAS 47, issued in May 2023. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2026. Earlier application is encouraged. If an entity applies the amendments for a period beginning before January 1, 2026, it shall disclose that fact and apply IPSAS 47 at the same time.**

103E. **Paragraphs 102A–102C and 126A–126B were added by *Improvements to IPSAS, 2023*, issued in April 2024. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2025. Earlier application is permitted. If an entity applies these amendments for an earlier period, it shall disclose that fact.**

103F. **Paragraphs 101A and 126C were added, and paragraph 106 was amended by *Improvements to IPSAS, 2023*, issued in April 2024. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2026. Earlier application is permitted. If an entity applies these amendments for an earlier period, it shall disclose that fact.**

103G **Paragraphs 18A–18D, 26A–26C, 29A, 64A, 71A, 81A, 96A, 96B, 97A, 97B, 117A–117F, AG32A, and AG60–AG62 were added and paragraphs 6, 54, 109, 118, and 120 were amended by *Concessionary Leases and Other Arrangements Conveying Rights over Assets* (Amendments to IPSAS 43, IPSAS 47, and IPSAS 48) issued in October 2024. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2027. Earlier application is permitted. If an entity applies the amendments for a period beginning before January 1, 2027, it shall disclose that fact and apply IPSAS 43, IPSAS 45, IPSAS 46, *Measurement*, IPSAS 47, and IPSAS 48, *Transfer Expenses* at the same time.**

103H. **Paragraph 30 was amended by *Amendments to IPSAS Standards: Specific IFRIC Interpretations*, issued in January 2025. An entity shall apply these amendments for annual periods beginning on or after January 1, 2026. Earlier application is encouraged. If an entity applies these amendments to financial statements for a period beginning before January 1, 2026, it shall disclose that fact.**

104. When an entity adopts accrual basis IPSAS Standards as defined in IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards* for financial reporting purposes subsequent to this effective date, this Standard applies to the entity's annual financial statements covering periods beginning on or after the date of adoption of IPSAS Standards.

105. If a lessee elects to apply this Standard early, a lessee shall apply paragraphs 48, 49, 64, 124, 125 and 126 for annual financial statements covering periods beginning on or after February 1, 2022. Earlier application is permitted, including in financial statements not authorized for issue at January 31, 2022.

Transition

106. For the purposes of the requirements in paragraphs 103–126C, the date of initial application is the beginning of the annual reporting period in which an entity first applies this Standard.

Definition of a Lease

107. As a practical expedient, an entity is not required to reassess whether a contract is, or contains, a lease at the date of initial application. Instead, the entity is permitted:

(a) To apply this Standard to contracts that were previously identified as leases applying IPSAS 13, *Leases*. The entity shall apply the transition requirements in paragraphs 109–122 to those leases.

(b) To not apply this Standard to contracts that were not previously identified as containing a lease applying IPSAS 13.

108. If an entity chooses the practical expedient in paragraph 107, it shall disclose that fact and apply the practical expedient to all of its contracts. As a result, the entity shall apply the requirements in paragraphs 10–12 only to contracts entered into (or changed) on or after the date of initial application.

Lessees

109. A lessee shall apply this Standard to its leases either:

(a) Retrospectively to each prior reporting period presented applying IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*; or

(b) Retrospectively with the cumulative effect of initially applying the Standard recognized at the date of initial application in accordance with paragraphs 111–117F.

110. A lessee shall apply the election described in paragraph 109 consistently to all of its leases in which it is a lessee.

111. If a lessee elects to apply this Standard in accordance with paragraph 109(b), the lessee shall not restate comparative information. Instead, the lessee shall recognize the cumulative effect of initially applying this Standard as an adjustment to the opening balance of accumulated surpluses/(deficits) (or other component of net assets/equity, as appropriate) at the date of initial application.

Leases Previously Classified as Operating Leases

112. If a lessee elects to apply this Standard in accordance with paragraph 109(b), the lessee shall:

(a) Recognize a lease liability at the date of initial application for leases previously classified as an operating lease applying IPSAS 13. The lessee shall measure that lease liability at the present value of the remaining lease payments, discounted using the lessee's incremental borrowing rate at the date of initial application.

(b) Recognize a right-of-use asset at the date of initial application for leases previously classified as an operating lease applying IPSAS 13. The lessee shall choose, on a lease-by-lease basis, to measure that right-of-use asset at either:

(i) Its carrying amount as if the Standard had been applied since the commencement date, but discounted using the lessee's incremental borrowing rate at the date of initial application; or

(ii) An amount equal to the lease liability, adjusted by the amount of any prepaid or accrued lease payments relating to that lease recognized in the statement of financial position immediately before the date of initial application.

(c) Apply IPSAS 21 or IPSAS 26, as appropriate, to right-of-use assets at the date of initial application, unless the lessee applies the practical expedient in paragraph 114(b).

113. Notwithstanding the requirements in paragraph 112, for leases previously classified as operating leases applying IPSAS 13, a lessee:

(a) Is not required to make any adjustments on transition for leases for which the underlying asset is of low value (as described in paragraphs AG4–AG9) that will be accounted for applying paragraph 7. The lessee shall account for those leases applying this Standard from the date of initial application.

(b) Is not required to make any adjustments on transition for leases previously accounted for as investment property using the fair value measurement basis in the current value model in IPSAS 16. The lessee shall account for the right-of-use asset and the lease liability arising from those leases applying IPSAS 16 and this Standard from the date of initial application.

(c) Shall measure the right-of-use asset at fair value at the date of initial application for leases previously accounted for as operating leases applying IPSAS 13 and that will be accounted for as investment property using the fair value measurement basis in the current value model in IPSAS 16 from the date of initial application. The lessee shall account for the right-of-use asset and the lease liability arising from those leases applying IPSAS 16 and this Standard from the date of initial application.

114. A lessee may use one or more of the following practical expedients when applying this Standard retrospectively in accordance with paragraph 109(b) to leases previously classified as operating leases applying IPSAS 13. A lessee is permitted to apply these practical expedients on a lease-by-lease basis:

(a) A lessee may apply a single discount rate to a portfolio of leases with reasonably similar characteristics (such as leases with a similar remaining lease term for a similar class of underlying asset in a similar economic environment).

(b) A lessee may rely on its assessment of whether leases are onerous applying IPSAS 19 immediately before the date of initial application as an alternative to performing an impairment review. If a lessee chooses this practical expedient, the lessee shall adjust the right-of-use asset at the date of initial application by the amount of any provision for onerous leases recognized in the statement of financial position immediately before the date of initial application.

(c) A lessee may elect not to apply the requirements in paragraph 112 to leases for which the lease term ends within 12 months of the date of initial application. In this case, a lessee shall:

(i) Account for those leases in the same way as short-term leases as described in paragraph 7; and

(ii) Include the cost associated with those leases within the disclosure of short-term lease expense in the annual reporting period that includes the date of initial application.

(d) A lessee may exclude initial direct costs from the measurement of the right-of-use asset at the date of initial application.

(e) A lessee may use hindsight, such as in determining the lease term if the contract contains options to extend or terminate the lease.

Leases Previously Classified as Finance Leases

115. If a lessee elects to apply this Standard in accordance with paragraph 109(b), for leases that were classified as finance leases applying IPSAS 13, the carrying amount of the right-of-use asset and the lease liability at

the date of initial application shall be the carrying amount of the lease asset and lease liability immediately before that date measured applying IPSAS 13. For those leases, a lessee shall account for the right-of-use asset and the lease liability applying this Standard from the date of initial application.

Disclosure

116. If a lessee elects to apply this Standard in accordance with paragraph 109(b), the lessee shall disclose information about initial application required by paragraph 33 of IPSAS 3, except for the information specified in paragraph 33(f) of IPSAS 3. Instead of the information specified in paragraph 33(f) of IPSAS 3, the lessee shall disclose:

(a) The weighted average lessee's incremental borrowing rate applied to lease liabilities recognized in the statement of financial position at the date of initial application; and

(b) An explanation of any difference between:

(i) Operating lease commitments disclosed applying IPSAS 13 at the end of the annual reporting period immediately preceding the date of initial application, discounted using the incremental borrowing rate at the date of initial application as described in paragraph 112(a); and

(ii) Lease liabilities recognized in the statement of financial position at the date of initial application.

117. If a lessee uses one or more of the specified practical expedients in paragraph 114, it shall disclose that fact.

Concessionary Leases

Leases Previously Classified as Operating Leases

117A. If a lessee elects to apply this Standard in accordance with paragraph 109(b), the lessee shall:

(a) Recognize a lease liability at the date of initial application for concessionary leases previously classified as an operating lease applying IPSAS 13. The lessee shall measure that lease liability at the present value of the remaining lease payments, discounted using the lessee's incremental borrowing rate at the date of initial application.

(b) Recognize a right-of-use asset at the date of initial application for concessionary leases previously classified as an operating lease applying IPSAS 13. The lessee shall measure that right-of-use asset at the present value of payments for the remaining lease term at market rates based on the current use of the underlying asset and discounted using the lessee's incremental borrowing rate at the date of initial application.

117B. Notwithstanding the requirements in paragraph 117A, for concessionary leases previously classified as operating leases applying IPSAS 13, a lessee is not required to make any adjustments on transition for concessionary leases previously accounted for as investment property using the fair value model in IPSAS 16, *Investment Property*. The lessee shall account for the right-of-use asset and the lease liability arising from those leases applying IPSAS 16 and this Standard from the date of initial application.

117C. A lessee may use one or more of the practical expedients in paragraphs 114(a), 114(b), 114(d), and 114(e) when applying this Standard retrospectively in accordance with paragraph 109(b) to concessionary leases previously classified as operating leases applying IPSAS 13.

117D. A lessee may elect not to apply the requirements in paragraph 117A to concessionary leases for which the lease term ends within 12 months of the date of initial application. In this case, the lessee shall:

(a) Account for those leases in the same way as short-term leases as described in paragraph 7; and

(b) Include the cost associated with those concessionary leases within the disclosure of short-term lease expense in the annual reporting period that includes the date of initial application.

Leases Previously Classified as Finance Leases

117E. If a lessee elects to apply this Standard in accordance with paragraph 109(b), for concessionary leases that were classified as finance leases applying IPSAS 13, at the date of initial application the lessee shall:

(a) Measure the lease liability at the carrying amount of the lease liability immediately before that date measured applying IPSAS 13; and

(b) Recognize a right-of-use asset and measure in accordance with paragraph 117A(b).

(c) For those concessionary leases, a lessee shall account for the right-of-use asset and the lease liability applying this Standard from the date of initial application.

Disclosure

117F. If a lessee elects to apply this Standard in accordance with paragraph 109(b) for concessionary leases, the lessee shall disclose information according to paragraphs 116 and 117, as appropriate.

Lessors

118. Except as described in paragraph 119, a lessor is not required to make any adjustments on transition for leases, including concessionary leases, in which it is a lessor and shall account for those leases applying this Standard from the date of initial application.

119. An intermediate lessor shall:

(a) Reassess subleases that were classified as operating leases applying IPSAS 13 and are ongoing at the date of initial application, to determine whether each sublease should be classified as an operating lease or a finance lease applying this Standard. The intermediate lessor shall perform this assessment at the date of initial application on the basis of the remaining contractual terms and conditions of the head lease and sublease at that date.

(b) For subleases that were classified as operating leases applying IPSAS 13 but finance leases applying this Standard, account for the sublease as a new finance lease entered into at the date of initial application.

Sale and Leaseback Transactions Before the Date of Initial Application

120. An entity shall not reassess sale and leaseback transactions entered into before the date of initial application to determine whether:

(a) The transfer of the underlying asset satisfies the requirements in IPSAS 47 to be accounted for as a sale; and

(b) The leaseback satisfies the requirements in this Standard to be accounted for as a concessionary leaseback.

121. If a sale and leaseback transaction was accounted for as a sale and a finance lease applying IPSAS 13, the seller-lessee shall:

(a) Account for the leaseback in the same way as it accounts for any other finance lease that exists at the date of initial application; and

(b) Continue to amortize any gain on sale over the lease term.

122. If a sale and leaseback transaction was accounted for as a sale and operating lease applying IPSAS 13, the seller-lessee shall:

(a) Account for the leaseback in the same way as it accounts for any other operating lease that exists at the date of initial application; and

(b) Adjust the leaseback right-of-use asset for any deferred gains or losses that relate to off-market terms recognized in the statement of financial position immediately before the date of initial application.

Amounts Previously Recognized in Respect of Public Sector Combinations

123. If a lessee previously recognized an asset or a liability applying IPSAS 40, *Public Sector Combinations* relating to favorable or unfavorable terms of an operating lease acquired as part of a public sector combination, the lessee shall derecognize that asset or liability and adjust the carrying amount of the right-of-use asset by a corresponding amount at the date of initial application.

COVID-19-Related Rent Concessions for Lessees

124. A lessee shall apply paragraphs 48, 49, and 64 retrospectively, recognizing the cumulative effect of initially applying that amendment as an adjustment to the opening balance of accumulated surpluses/(deficits) (or other component of net assets/equity, as appropriate) at the beginning of the annual reporting period in which the lessee first applies the amendment.

125. In the reporting period in which a lessee first applies paragraph 48, 49, and 64, a lessee is not required to disclose the information required by paragraph 33(f) of IPSAS 3.

126. Applying paragraph 2 of this Standard, a lessee shall apply the practical expedient in paragraph 48 consistently to eligible contracts with similar characteristics and in similar circumstances, irrespective of whether the contract became eligible for the practical expedient as a result of the lessee applying the COVID-19-Related Rent Concessions requirements.

Interest Rate Benchmark Reform—Phase 2

126A. An entity shall apply these amendments retrospectively in accordance with IPSAS 3, except as specified in paragraph 126B.

126B. An entity is not required to restate prior periods to reflect the application of these amendments. The entity may restate prior periods if, and only if, it is possible without the use of hindsight. If an entity does not restate prior periods, the entity shall recognize any difference between the previous carrying amount and the carrying amount at the beginning of the annual reporting period that includes the date of initial application of these amendments in the opening net assets/equity (or other component of equity, as appropriate) of the annual reporting period that includes the date of initial application of these amendments.

Lease Liability in a Sale and Leaseback

126C. A seller-lessee shall apply paragraphs 101A and 106 (see paragraph 103F) retrospectively in accordance with IPSAS 3 to sale and leaseback transactions entered into after the date of initial application.

Withdrawal and Replacement of IPSAS 13 (December 2006)

127. This Standard supersedes IPSAS 13 issued in 2006. IPSAS 13 remains applicable until this Standard is applied or becomes effective, whichever is earlier.

Appendix A

Application Guidance

This Appendix is an integral part of IPSAS 43.

Portfolio Application

AG1. This Standard specifies the accounting for an individual lease. However, as a practical expedient, an entity may apply this Standard to a portfolio of leases with similar characteristics if the entity reasonably expects that the effects on the financial statements of applying this Standard to the portfolio would not differ materially from applying this Standard to the individual leases within that portfolio. If accounting for a portfolio, an entity shall use estimates and assumptions that reflect the size and composition of the portfolio.

Combination of Contracts

AG2. In applying this Standard, an entity shall combine two or more contracts entered into at or near the same time with the same counterparty (or related parties of the counterparty), and account for the contracts as a single contract if one or more of the following criteria are met:

(a) The contracts are negotiated as a package with an overall commercial objective that cannot be understood without considering the contracts together;

(b) The amount of consideration to be paid in one contract depends on the price or performance of the other contract; or

(c) The rights to use underlying assets conveyed in the contracts (or some rights to use underlying assets conveyed in each of the contracts) form a single lease component as described in paragraph AG33.

Definitions (see paragraph 5)

AG3. An entity considers the substance rather than the legal form of an arrangement in determining whether it is a “contract” for the purposes of this Standard. Contracts, for the purposes of this Standard, are generally evidenced by the following (although this may differ from jurisdiction to jurisdiction):

- Contracts involve willing parties entering into an arrangement;
- The terms of the contract create rights and obligations for the parties to the contract, and those rights and obligations need not result in equal performance by each party; and
- The remedy for non-performance is enforceable by law.

Recognition Exemption: Leases for Which the Underlying Asset is of Low Value (paragraphs 6–9)

AG4. Except as specified in paragraph AG8, this Standard permits a lessee to apply paragraph 7 to account for leases for which the underlying asset is of low value. A lessee shall assess the value of an underlying asset based on the value of the asset when it is new, regardless of the age of the asset being leased.

AG5. The assessment of whether an underlying asset is of low value is performed on an absolute basis. Leases of low-value assets qualify for the accounting treatment in paragraph 7 regardless of whether those leases are material to the lessee. The assessment is not affected by the size, nature or circumstances of the lessee. Accordingly, different lessees are expected to reach similar conclusions about whether a particular underlying asset is of low value.

AG6. An underlying asset can be of low value only if:

(a) The lessee can benefit from use of the underlying asset on its own or together with other resources that are readily available to the lessee; and

(b) The underlying asset is not highly dependent on, or highly interrelated with, other assets.

AG7. A lease of an underlying asset does not qualify as a lease of a low-value asset if the nature of the asset is such that, when new, the asset is typically not of low value. For example, leases of cars would not qualify as leases of low-value assets because a new car would typically not be of low value.

AG8. If a lessee subleases an asset, or expects to sublease an asset, the head lease does not qualify as a lease of a low-value asset.

AG9. Examples of low-value underlying assets can include tablet and personal computers, small items of office furniture and telephones.

Identifying a Lease (paragraphs 10–12)

AG10. To assess whether a contract conveys the right to control the use of an identified asset (see paragraphs AG14–AG21) for a period of time, an entity shall assess whether, throughout the period of use, the customer has both of the following:

(a) The right to obtain substantially all of the economic benefits or service potential from use of the identified asset (as described in paragraphs AG22–AG24); and

(b) The right to direct the use of the identified asset (as described in paragraphs AG25–AG31).

AG11. If the customer has the right to control the use of an identified asset for only a portion of the term of the contract, the contract contains a lease for that portion of the term.

AG12. A contract to receive goods or services may be entered into by a joint arrangement, or on behalf of a joint arrangement, as defined in IPSAS 37, *Joint Arrangements*. In this case, the joint arrangement is considered to be the customer in the contract. Accordingly, in assessing whether such a contract contains a lease, an entity shall assess whether the joint arrangement has the right to control the use of an identified asset throughout the period of use.

AG13. An entity shall assess whether a contract contains a lease for each potential separate lease component. Refer to paragraph AG33 for guidance on separate lease components.

Identified Asset

AG14. An asset is typically identified by being explicitly specified in a contract. However, an asset can also be identified by being implicitly specified at the time that the asset is made available for use by the customer.

Substantive Substitution Rights

AG15. Even if an asset is specified, a customer does not have the right to use an identified asset if the supplier has the substantive right to substitute the asset throughout the period of use. A supplier's right to substitute an asset is substantive only if both of the following conditions exist:

(a) The supplier has the practical ability to substitute alternative assets throughout the period of use (for example, the customer cannot prevent the supplier from substituting the asset and alternative assets are readily available to the supplier or could be sourced by the supplier within a reasonable period of time); and

(b) The supplier would benefit economically from the exercise of its right to substitute the asset (i.e., the economic benefits associated with substituting the asset are expected to exceed the costs associated with substituting the asset).

AG16. If the supplier has a right or an obligation to substitute the asset only on or after either a particular date or the occurrence of a specified event, the supplier's substitution right is not substantive because the supplier does not have the practical ability to substitute alternative assets throughout the period of use.

AG17. An entity's evaluation of whether a supplier's substitution right is substantive is based on facts and circumstances at inception of the contract and shall exclude consideration of future events that, at inception of the contract, are not considered likely to occur. Examples of future events that, at inception of the contract, would not be considered likely to occur and, thus, should be excluded from the evaluation include:

(a) An agreement by a future customer to pay an above market rate for use of the asset;

(b) The introduction of new technology that is not substantially developed at inception of the contract;

(c) A substantial difference between the customer's use of the asset, or the performance of the asset, and the use or performance considered likely at inception of the contract; and

(d) A substantial difference between the market price of the asset during the period of use, and the market price considered likely at inception of the contract.

AG18. If the asset is located at the customer's premises or elsewhere, the costs associated with substitution are generally higher than when located at the supplier's premises and, therefore, are more likely to exceed the benefits associated with substituting the asset.

AG19. The supplier's right or obligation to substitute the asset for repairs and maintenance, if the asset is not operating properly or if a technical upgrade becomes available does not preclude the customer from having the right to use an identified asset.

AG20. If the customer cannot readily determine whether the supplier has a substantive substitution right, the customer shall presume that any substitution right is not substantive.

Portions of Assets

AG21. A capacity portion of an asset is an identified asset if it is physically distinct (for example, a floor of a building). A capacity or other portion of an asset that is not physically distinct (for example, a capacity portion of a fiber optic cable) is not an identified asset, unless it represents substantially all of the capacity of the asset and thereby provides the customer with the right to obtain substantially all of the economic benefits or service potential from use of the asset.

Right to Obtain Economic Benefits or Service Potential from Use

AG22. To control the use of an identified asset, a customer is required to have the right to obtain substantially all of the economic benefits or service potential from use of the asset throughout the period of use (for example, by having exclusive use of the asset throughout that period). A customer can obtain economic benefits or service potential from use of an asset directly or indirectly in many ways, such as by using, holding or sub-leasing the asset. The economic benefits or service potential from use of an asset include its primary output and by-products (including potential cash flows derived from these items), and other economic benefits or service potential from using the asset that could be realized from a commercial transaction with a third party.

AG23. When assessing the right to obtain substantially all of the economic benefits or service potential from use of an asset, an entity shall consider the economic benefits or service potential that result from use of the asset within the defined scope of a customer's right to use the asset (see paragraph AG31). For example:

(a) If a contract limits the use of a motor vehicle to only one particular territory during the period of use, an entity shall consider only the economic benefits or service potential from use of the motor vehicle within that territory, and not beyond.

(b) If a contract specifies that a customer can drive a motor vehicle only up to a particular number of miles during the period of use, an entity shall consider only the economic benefits or service potential from use of the motor vehicle for the permitted mileage, and not beyond.

AG24. If a contract requires a customer to pay the supplier or another party a portion of the cash flows derived from use of an asset as consideration, those cash flows paid as consideration shall be considered to be part of the economic benefits that the customer obtains from use of the asset. For example, if the customer is required to pay the supplier a percentage of sales from use of space as consideration for that use, that requirement does not prevent the customer from having the right to obtain substantially all of the economic benefits from use of the space. This is because the cash flows arising from those sales are considered to be economic benefits that the customer obtains from use of the space, a portion of which it then pays to the supplier as consideration for the right to use that space.

Right to Direct the Use

AG25. A customer has the right to direct the use of an identified asset throughout the period of use only if either:

(a) The customer has the right to direct how and for what purpose the asset is used throughout the period of use (as described in paragraphs AG26–AG31); or

(b) The relevant decisions about how and for what purpose the asset is used are predetermined and:

(i) The customer has the right to operate the asset (or to direct others to operate the asset in a manner that it determines) throughout the period of use, without the supplier having the right to change those operating instructions; or

(ii) The customer designed the asset (or specific aspects of the asset) in a way that predetermines how and for what purpose the asset will be used throughout the period of use.

How and For What Purpose the Asset is Used

AG26. A customer has the right to direct how and for what purpose the asset is used if, within the scope of its right of use defined in the contract, it can change how and for what purpose the asset is used throughout the period of use. In making this assessment, an entity considers the decision-making rights that are most relevant to changing how and for what purpose the asset is used throughout the period of use. Decision-making rights are relevant when they affect the economic benefits or service potential to be derived from use. The decision-making rights that are most relevant are likely to be different for different contracts, depending on the nature of the asset and the terms and conditions of the contract.

AG27. Examples of decision-making rights that, depending on the circumstances, grant the right to change how and for what purpose the asset is used, within the defined scope of the customer's right of use, include:

(a) Rights to change the type of output that is produced by the asset (for example, to decide whether to use a shipping container to transport goods or for storage, or to decide upon the mix of products sold from a tourism outlet);

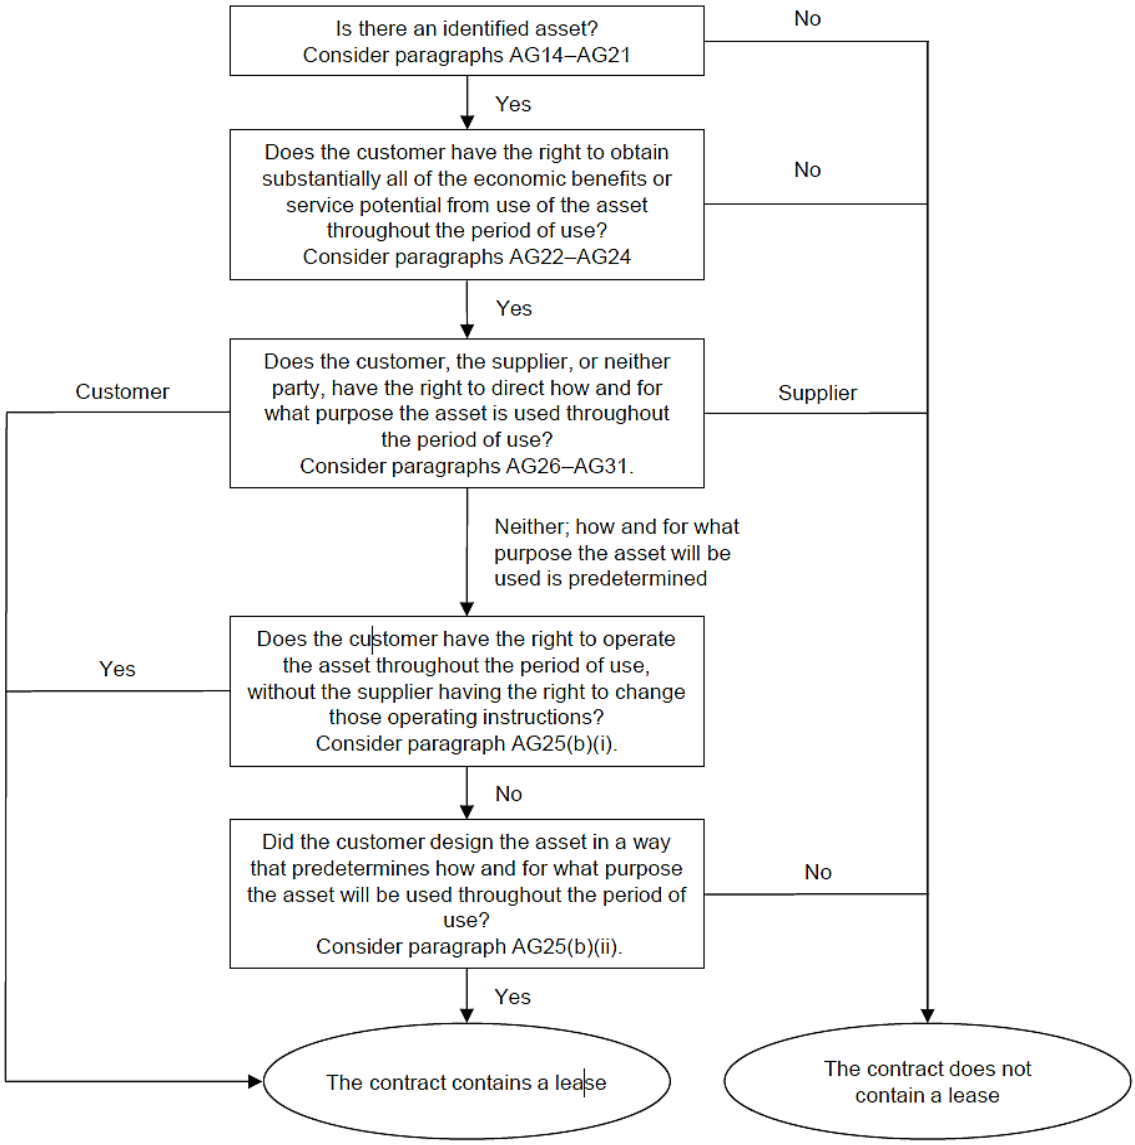
(b) Rights to change when the output is produced (for example, to decide when an item of machinery or a power plant will be used);

(c) Rights to change where the output is produced (for example, to decide upon the destination of a truck or a ship, or to decide where an item of equipment is used); and

(d) Rights to change whether the output is produced, and the quantity of that output (for example, to decide whether to produce energy from a power plant and how much energy to produce from that power plant).

AG28. Examples of decision-making rights that do not grant the right to change how and for what purpose the asset is used include rights that are limited to operating or maintaining the asset. Such rights can be held by the customer or the supplier. Although rights such as those to operate or maintain an asset are often essential to the efficient use of an asset, they are not rights to direct how and for what purpose the asset is used and are often dependent on the decisions about how and for what purpose the asset is used. However, rights to operate an asset may grant the customer the right to direct the use of the asset if the relevant decisions about how and for what purpose the asset is used are predetermined (see paragraph AG25(b)(i)).

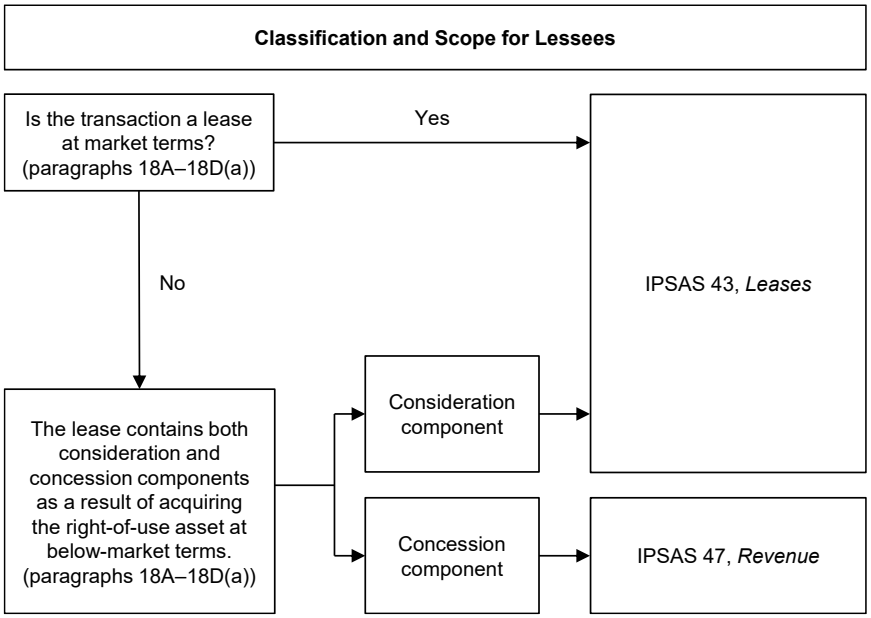
Decisions Determined During and Before the Period of Use



AG29. The relevant decisions about how and for what purpose the asset is used can be predetermined in a number of ways. For example, the relevant decisions can be predetermined by the design of the asset or by contractual restrictions on the use of the asset.

AG30. In assessing whether a customer has the right to direct the use of an asset, an entity shall consider only rights to make decisions about the use of the asset during the period of use, unless the customer designed the asset (or specific aspects of the asset) as described in paragraph AG25(b)(ii). Consequently, unless the conditions in paragraph AG25(b)(ii) exist, an entity shall not consider decisions that are predetermined before the period of use. For example, if a customer is able only to specify the output of an asset before the period of use, the customer does not have the right to direct the use of that asset. The ability to specify the output in a contract before the period of use, without any other decision-making rights relating to the use of the asset, gives a customer the same rights as any customer that purchases goods or services.

Protective Rights



AG31. A contract may include terms and conditions designed to protect the supplier’s interest in the asset or other assets, to protect its personnel, or to ensure the supplier’s compliance with laws or regulations. These are examples of protective rights. For example, a contract may (i) specify the maximum amount of use of an asset or limit where or when the customer can use the asset, (ii) require a customer to follow particular operating practices, or (iii) require a customer to inform the supplier of changes in how an asset will be used. Protective rights typically define the scope of the customer’s right of use but do not, in isolation, prevent the customer from having the right to direct the use of an asset.

AG32. The following flowchart may assist entities in making the assessment of whether a contract is, or contains, a lease.

Classification of Leases at Market Terms and at Below-Market Terms and Scoping for Lessees (paragraphs 18A–18D)

AG32A. The diagram below establishes the classification and scope of leases for lessees.

Separating Components of a Contract (paragraphs 13–18)

AG33. The right to use an underlying asset is a separate lease component if both:

(a) The lessee can benefit from use of the underlying asset either on its own or together with other resources that are readily available to the lessee. Readily available resources are goods or services that are sold or leased separately (by the lessor or other suppliers) or resources that the lessee has already obtained (from the lessor or from other transactions or events); and

(b) The underlying asset is neither highly dependent on, nor highly interrelated with, the other underlying assets in the contract. For example, the fact that a lessee could decide not to lease the underlying asset without significantly affecting its rights to use other underlying assets in the contract might indicate that the underlying asset is not highly dependent on, or highly interrelated with, those other underlying assets.

AG34. A contract may include an amount payable by the lessee for activities and costs that do not transfer a good or service to the lessee. For example, a lessor may include in the total amount payable a charge for administrative tasks, or other costs it incurs associated with the lease, that do not transfer a good or service to the lessee. Such amounts payable do not give rise to a separate component of the contract, but are considered to be part of the total consideration that is allocated to the separately identified components of the contract.

Lease Term (paragraphs 19–22)

AG35. In determining the lease term and assessing the length of the non-cancellable period of a lease, an entity shall apply the definition of a contract and determine the period for which the contract is enforceable. A lease is no longer enforceable when the lessee and the lessor each has the right to terminate the lease without permission from the other party with no more than an insignificant penalty.

AG36. If only a lessee has the right to terminate a lease, that right is considered to be an option to terminate the lease available to the lessee that an entity considers when determining the lease term. If only a lessor has the right to terminate a lease, the non-cancellable period of the lease includes the period covered by the option to terminate the lease.

AG37. The lease term begins at the commencement date and includes any rent-free periods provided to the lessee by the lessor.

AG38. At the commencement date, an entity assesses whether the lessee is reasonably certain to exercise an option to extend the lease or to purchase the underlying asset, or not to exercise an option to terminate the lease. The entity considers all relevant facts and circumstances that create an economic incentive for the lessee to exercise, or not to exercise, the option, including any expected changes in facts and circumstances from the commencement date until the exercise date of the option. Examples of factors to consider include, but are not limited to:

(a) Contractual terms and conditions for the optional periods compared with market rates, such as:

(i) The amount of payments for the lease in any optional period;

(ii) The amount of any variable payments for the lease or other contingent payments, such as payments resulting from termination penalties and residual value guarantees; and

(iii) The terms and conditions of any options that are exercisable after initial optional periods (for example, a purchase option that is exercisable at the end of an extension period at a rate that is currently below market rates).

(b) Significant leasehold improvements undertaken (or expected to be undertaken) over the term of the contract that are expected to have significant economic benefit for the lessee when the option to extend or terminate the lease, or to purchase the underlying asset, becomes exercisable;

(c) Costs relating to the termination of the lease, such as negotiation costs, relocation costs, costs of identifying another underlying asset suitable for the lessee's needs, costs of integrating a new asset into the lessee's operations, or termination penalties and similar costs, including costs associated with returning the underlying asset in a contractually specified condition or to a contractually specified location;

(d) The importance of that underlying asset to the lessee's operations, considering, for example, whether the underlying asset is a specialized asset, the location of the underlying asset and the availability of suitable alternatives; and

(e) Conditionality associated with exercising the option (i.e., when the option can be exercised only if one or more conditions are met), and the likelihood that those conditions will exist.

AG39. An option to extend or terminate a lease may be combined with one or more other contractual features (for example, a residual value guarantee) such that the lessee guarantees the lessor a minimum or fixed cash return that is substantially the same regardless of whether the option is exercised. In such cases, and notwithstanding the guidance on in-substance fixed payments in paragraph AG43, an entity shall assume that the lessee is reasonably certain to exercise the option to extend the lease, or not to exercise the option to terminate the lease.

AG40. The shorter the non-cancellable period of a lease, the more likely a lessee is to exercise an option to extend the lease or not to exercise an option to terminate the lease. This is because the costs associated with obtaining a replacement asset are likely to be proportionately higher the shorter the non-cancellable period.

AG41. A lessee's past practice regarding the period over which it has typically used particular types of assets (whether leased or owned), and its economic reasons for doing so, may provide information that is helpful in assessing whether the lessee is reasonably certain to exercise, or not to exercise, an option. For example, if a lessee has typically used particular types of assets for a particular period of time or if the lessee has a practice of frequently exercising options on leases of particular types of underlying assets, the lessee shall

consider the economic reasons for that past practice in assessing whether it is reasonably certain to exercise an option on leases of those assets.

AG42. Paragraph 21 specifies that, after the commencement date, a lessee reassesses the lease term upon the occurrence of a significant event or a significant change in circumstances that is within the control of the lessee and affects whether the lessee is reasonably certain to exercise an option not previously included in its determination of the lease term, or not to exercise an option previously included in its determination of the lease term. Examples of significant events or changes in circumstances include:

(a) Significant leasehold improvements not anticipated at the commencement date that are expected to have significant economic benefit for the lessee when the option to extend or terminate the lease, or to purchase the underlying asset, becomes exercisable;

(b) A significant modification to, or customization of, the underlying asset that was not anticipated at the commencement date;

(c) The inception of a sublease of the underlying asset for a period beyond the end of the previously determined lease term; and

(d) A decision of the lessee that is directly relevant to exercising, or not exercising, an option (for example, a decision to extend the lease of a complementary asset, to dispose of an alternative asset or to dispose of an operation within which the right-of-use asset is employed).

In-Substance Fixed Lease Payments (paragraphs 28(a), 37(c) and 74(a))

AG43. Lease payments include any in-substance fixed lease payments. In-substance fixed lease payments are payments that may, in form, contain variability but that, in substance, are unavoidable. In-substance fixed lease payments exist, for example, if:

(a) Payments are structured as variable lease payments, but there is no genuine variability in those payments. Those payments contain variable clauses that do not have real economic substance. Examples of those types of payments include:

(i) Payments that must be made only if an asset is proven to be capable of operating during the lease, or only if an event occurs that has no genuine possibility of not occurring; or

(ii) Payments that are initially structured as variable lease payments linked to the use of the underlying asset but for which the variability will be resolved at some point after the commencement date so that the payments become fixed for the remainder of the lease term. Those payments become in-substance fixed payments when the variability is resolved.

(b) There is more than one set of payments that a lessee could make, but only one of those sets of payments is realistic. In this case, an entity shall consider the realistic set of payments to be lease payments.

(c) There is more than one realistic set of payments that a lessee could make, but it must make at least one of those sets of payments. In this case, an entity shall consider the set of payments that aggregates to the lowest amount (on a discounted basis) to be lease payments.

Lessee Involvement with the Underlying Asset before the Commencement Date

Costs of the Lessee relating to the Construction or Design of the Underlying Asset

AG44. An entity may negotiate a lease before the underlying asset is available for use by the lessee. For some leases, the underlying asset may need to be constructed or redesigned for use by the lessee. Depending on

the terms and conditions of the contract, a lessee may be required to make payments relating to the construction or design of the asset.

AG45. If a lessee incurs costs relating to the construction or design of an underlying asset, the lessee shall account for those costs applying other applicable Standards, such as IPSAS 45. Costs relating to the construction or design of an underlying asset do not include payments made by the lessee for the right to use the underlying asset. Payments for the right to use an underlying asset are payments for a lease, regardless of the timing of those payments.

Legal Title to the Underlying Asset

AG46. A lessee may obtain legal title to an underlying asset before that legal title is transferred to the lessor and the asset is leased to the lessee. Obtaining legal title does not in itself determine how to account for the transaction.

AG47. If the lessee controls (or obtains control of) the underlying asset before that asset is transferred to the lessor, the transaction is a sale and leaseback transaction that is accounted for applying paragraphs 97–102.

AG48. However, if the lessee does not obtain control of the underlying asset before the asset is transferred to the lessor, the transaction is not a sale and leaseback transaction. For example, this may be the case if a producer, a lessor and a lessee negotiate a transaction for the purchase of an asset from the producer by the lessor, which is in turn leased to the lessee. The lessee may obtain legal title to the underlying asset before legal title transfers to the lessor. In this case, if the lessee obtains legal title to the underlying asset but does not obtain control of the asset before it is transferred to the lessor, the transaction is not accounted for as a sale and leaseback transaction, but as a lease.

Lessee Disclosures (paragraph 62)

AG49. In determining whether additional information about leasing activities is necessary to meet the disclosure objective in paragraph 54, a lessee shall consider:

(a) Whether that information is relevant to users of financial statements. A lessee shall provide additional information specified in paragraph 62 only if that information is expected to be relevant to users of financial statements. In this context, this is likely to be the case if it helps those users to understand:

(i) The flexibility provided by leases. Leases may provide flexibility if, for example, a lessee can reduce its exposure by exercising termination options or renewing leases with favorable terms and conditions.

(ii) Restrictions imposed by leases. Leases may impose restrictions, for example, by requiring the lessee to maintain particular financial ratios.

(iii) Sensitivity of reported information to key variables. Reported information may be sensitive to, for example, future variable lease payments.

(iv) Exposure to other risks arising from leases.

(v) Deviations from industry practice. Such deviations may include, for example, unusual or unique lease terms and conditions that affect a lessee’s lease portfolio.

(b) Whether that information is apparent from information either presented in the primary financial statements or disclosed in the notes. A lessee need not duplicate information that is already presented elsewhere in the financial statements.

AG50. Additional information relating to variable lease payments that, depending on the circumstances, may be needed to satisfy the disclosure objective in paragraph 54 could include information that helps users of financial statements to assess, for example:

(a) The lessee's reasons for using variable lease payments and the prevalence of those payments;

(b) The relative magnitude of variable lease payments to fixed payments;

(c) Key variables upon which variable lease payments depend and how payments are expected to vary in response to changes in those key variables; and

(d) Other operational and financial effects of variable lease payments.

AG51. Additional information relating to extension options or termination options that, depending on the circumstances, may be needed to satisfy the disclosure objective in paragraph 54 could include information that helps users of financial statements to assess, for example:

(a) The lessee's reasons for using extension options or termination options and the prevalence of those options;

(b) The relative magnitude of optional lease payments to lease payments;

(c) The prevalence of the exercise of options that were not included in the measurement of lease liabilities; and

(d) Other operational and financial effects of those options.

AG52. Additional information relating to residual value guarantees that, depending on the circumstances, may be needed to satisfy the disclosure objective in paragraph 54 could include information that helps users of financial statements to assess, for example:

(a) The lessee's reasons for providing residual value guarantees and the prevalence of those guarantees;

(b) The magnitude of a lessee's exposure to residual value risk;

(c) The nature of underlying assets for which those guarantees are provided; and

(d) Other operational and financial effects of those guarantees.

AG53. Additional information relating to sale and leaseback transactions that, depending on the circumstances, may be needed to satisfy the disclosure objective in paragraph 54 could include information that helps users of financial statements to assess, for example:

(a) The lessee's reasons for sale and leaseback transactions and the prevalence of those transactions;

(b) Key terms and conditions of individual sale and leaseback transactions;

(c) Payments not included in the measurement of lease liabilities; and

(d) The cash flow effect of sale and leaseback transactions in the reporting period.

Lessor Lease Classification (paragraphs 65–70)

AG54. The classification of leases for lessors in this Standard is based on the extent to which the lease transfers the risks and rewards incidental to ownership of an underlying asset. Risks include the possibilities of losses from idle capacity or technological obsolescence and of variations in return because of changing economic conditions. Rewards may be represented by the expectation of service potential or profitable operation over the underlying asset's economic life and of gain from appreciation in value or realization of a residual value.

AG55. A lease contract may include terms and conditions to adjust the lease payments for particular changes that occur between the inception date and the commencement date (such as a change in the lessor's cost of the underlying asset or a change in the lessor's cost of financing the lease). In that case, for the purposes of classifying the lease, the effect of any such changes shall be deemed to have taken place at the inception date.

AG56. When a lease includes both land and buildings elements, a lessor shall assess the classification of each element as a finance lease or an operating lease separately applying paragraphs 66–70 and AG54–AG55. In determining whether the land element is an operating lease or a finance lease, an important consideration is that land normally has an indefinite economic life.

AG57. Whenever necessary in order to classify and account for a lease of land and buildings, a lessor shall allocate lease payments (including any lump-sum upfront payments) between the land and the buildings elements in proportion to the relative fair values of the leasehold interests in the land element and buildings element of the lease at the inception date. If the lease payments cannot be allocated reliably[1] between these two elements, the entire lease is classified as a finance lease, unless it is clear that both elements are operating leases, in which case the entire lease is classified as an operating lease.

AG58. For a lease of land and buildings in which the amount for the land element is immaterial to the lease, a lessor may treat the land and buildings as a single unit for the purpose of lease classification and classify it as a finance lease or an operating lease applying paragraphs 66–70 and AG54–AG55. In such a case, a lessor shall regard the economic life of the buildings as the economic life of the entire underlying asset.

Sublease Classification

AG59. In classifying a sublease, an intermediate lessor shall classify the sublease as a finance lease or an operating lease as follows:

(a) If the head lease is a short-term lease that the entity, as a lessee, has accounted for applying paragraph 6, the sublease shall be classified as an operating lease.

(b) Otherwise, the sublease shall be classified by reference to the right-of-use asset arising from the head lease, rather than by reference to the underlying asset (for example, the item of property, plant or equipment that is the subject of the lease).

Concessionary Leases (see paragraphs 18A–18D, 26A–26C, 29A, 64A, 71A, and 81A)

AG60. Concessionary leases are granted to or received by a lessee at below-market terms. Examples of concessionary leases include leases granted to or received by international organizations or other public sector entities with public policy objectives at below-market terms at inception.

AG61. If a lessee receiving the right-of-use asset has determined that the transaction has a concession component, the difference between the present value of payments for the lease at market rates based on the current use of the underlying asset and the present value of contractual payments is accounted for in accordance with paragraphs AG153A–AG153B of IPSAS 47 at the commencement date.

AG62. If a lessor granting a concessionary lease has determined that the transaction has a concession component, at the commencement date:

(a) In a concessionary finance lease, the lessor:

(i) Derecognizes the underlying asset in accordance with the applicable IPSAS;

(ii) Recognizes the net investment in the lease in accordance with this Standard; and

(iii) Does not recognize the foregone revenue obtained by the difference between the present value of payments for the lease at market rates based on the current use of the underlying asset and the newly recognized net investment in the lease.

[1] Information that is reliable is free from material error and bias, and can be depended on by users to faithfully represent that which it purports to represent or could reasonably expected to represent. Paragraph BC16 of IPSAS 1 discusses the transitional approach to the explanation of reliability.

(b) In a concessionary operating lease, the lessor:

(i) Recognizes lease revenue in accordance with this Standard;

(ii) Does not recognize the foregone revenue obtained by the difference between the contractual payments and the payments for the lease at market rates based on the current use of the underlying asset; and

(iii) Shall assess whether the underlying asset is impaired in accordance with the applicable IPSAS.

Illustrative Examples are provided in paragraph IE296A of the Illustrative Examples accompanying IPSAS 47 as well as in paragraphs IE5, IE10A, and IE11 of the Illustrative Examples accompanying this Standard.

Appendix B

Amendments to Other IPSAS

[deleted]

Basis for Conclusions

This Basis for Conclusions accompanies, but is not part of, IPSAS 43.

Introduction

BC1. IPSAS 13, *Leases*, was drawn primarily from International Accounting Standard (IAS) 17, *Leases*, (revised 2003) issued by the International Accounting Standards Board (IASB). In January 2016, the IASB issued International Financial Reporting Standard (IFRS) 16, *Leases*. IFRS 16 replaced IAS 17 and a number of related interpretations[1].

BC2. In June 2016, the IPSASB approved a project brief to develop revised requirements for accounting for leases. This brief acknowledged, and reconfirmed, the IPSASB's conclusion in IPSAS 13 that the economics of a lease transaction are the same in both the public and private sectors, resulting in the decision that this should be an IFRS 16 alignment project.

BC3. The IPSASB's policy document, *Process for Reviewing and Modifying IASB Documents*, sets out the process the IPSASB follows when developing an aligned Standard. The first step of the process is to consider whether there are any public sector issues that warrant a departure from an IASB document.

BC4. In determining whether public sector issues warrant a departure from an IASB document, the IPSASB considers the following:

(a) Whether applying the requirements of the IASB document would mean that the objectives of public sector financial reporting would not be adequately met;

(b) Whether applying the requirements of the IASB document would mean that the qualitative characteristics of public sector financial reporting would not be adequately met; and

(c) Whether applying the requirements of the IASB document would require undue cost or effort.

BC5. The *Process for Reviewing and Modifying IASB Documents* requires the IPSASB to make its decisions in the context of the following:

(a) Consistency with the IPSASB's *Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities* (the *Conceptual Framework*);

(b) Internal consistency with existing IPSAS; and

(c) Consistency with the statistical bases.

Background

Development of ED 64, Leases

Lessee Accounting

BC6. IFRS 16 introduced a new lease accounting model for lessees—the right-of-use model. The right-of-use model is based on the foundational principle that leases are financings of the right to use an underlying asset, and results in lessee accounting as follows[2]:

(a) Recognizes a 'right-of-use asset'; and

---

[1] International Financial Reporting Interpretations Committee Interpretation IFRIC-4, *Determining whether an Arrangement contains a Lease* and Standing Interpretations Committee Interpretations SIC-15, *Operating Leases—Incentives* and SIC-27, *Evaluating the Substance of Transactions Involving the Legal Form of a Lease*.

[2] Except for short-term leases and leases for which the underlying asset is of low value, as described in IFRS 16.5–8.

(b) Recognizes a lease liability related to the future lease payments.

BC7. When developing ED 64, *Leases*, the IPSASB had considered whether there were any public sector issues that warranted a departure from the right-of-use model for lessee accounting in IFRS 16. In so doing, the IPSASB came to the following conclusions:

(a) The right-of-use asset satisfies the definition of, and recognition criteria for, an asset in the IPSASB's *Conceptual Framework*.

(b) The right-of-use asset is recognized when the lessee controls the asset, which is consistent with the IPSASB's *Conceptual Framework*.

(c) The information reported under the single right-of-use lessee accounting model specified in IFRS 16 would provide the most useful information to the broadest range of users of financial statements.

(d) The right-of-use model prevents accounting arbitrage and information asymmetry. It improves comparability between public sector entities that lease assets and public sector entities that purchase assets.

(e) The IPSASB acknowledged that there would be costs for lessees associated with implementing the right-of-use model in the public sector. However, the IPSASB considered that the benefits outweigh the costs, particularly if the IPSASB also adopted the exemptions in IFRS 16.

BC8. Consequently, the IPSASB had agreed that there were no public sector issues that warranted a departure from the right-of-use model for lessee accounting in IFRS 16. The IPSASB therefore had decided to develop ED 64 with lessee accounting requirements that were aligned with the requirements in IFRS 16.

Lessor Accounting

BC9. IFRS 16 retained the 'risks and rewards incidental to ownership' model applied in IAS 17 (and IPSAS 13). The IPSASB had considered whether there were any public sector issues that warranted a departure from the lessor accounting requirements in IFRS 16. In developing ED 64, the IPSASB had come to the view that the 'risks and rewards incidental to ownership' model:

(a) Is not based on control and would not be consistent with the IPSASB's *Conceptual Framework*.

(b) Does not distinguish between the right-of-use asset and the underlying asset. The IPSASB considered these to be different economic phenomena which should both be accounted for.

(c) If applied for lessor accounting, while a control-based model was applied for lessee accounting, would:

(i) Be inconsistent with IPSAS 17, *Property, Plant, and Equipment* and IPSAS 32, *Service Concession Arrangements: Grantor*, which are based on control; and

(ii) Raise consolidation issues and impair understandability and the decision usefulness of information where the lessor and the lessee are part of the same economic entity. For example, if the lessor classifies the lease as a finance lease, the underlying asset is not recognized by either party, and separate records will need to be maintained to report the underlying asset in the consolidated financial statements. In this context, the IPSASB had formed the view that a lessor would not be expected to derecognize a leased asset because the lessor has only transferred the right to use an underlying asset, not the underlying asset itself.

BC10. As a consequence, the IPSASB had decided to develop a right-of-use model for lessor accounting specifically designed for public sector financial reporting.

IPSASB Consultative Advisory Group

BC11. The IPSASB Consultative Advisory Group (CAG) had been consulted during the development of ED 64, in particular on the IPSASB's decision to depart from IFRS 16 in lessor accounting.

BC12. At its December 2016 meeting, the CAG advised the IPSASB of its views that:

(a) Symmetry may not be needed in lease accounting;

(b) The treatment of the underlying asset is an important issue in the public sector, and it needs to be recognized in the financial statements; and

(c) An approach drawn from IFRS 16 would result in the underlying asset not appearing in the statement of financial position of either the lessor or lessee in some cases and expressed a view that this would give rise to a public interest concern.

BC13. The CAG also advised the IPSASB that if it wants to pursue proposals other than IFRS 16 lessor accounting it may take a long time to develop an appropriate lessor accounting model given the experiences and challenges the IASB faced in attempting to do so.

ED 64, Leases

BC14. In January 2018, the IPSASB published ED 64, *Leases* proposing a single right-of-use model for lease accounting for lessees and lessors under which:

(a) The lessee would recognize a 'right-of-use asset' and a lease liability related to the future lease payments at the commencement of a lease; and

(b) The lessor would recognize a lease receivable and a lease liability (unearned revenue) at the commencement of a lease, while continuing to recognize and measure the underlying asset according to the applicable Standards.

BC15. ED 64 also proposed specific public sector accounting requirements on leases at below-market terms, also known as concessionary leases. The proposal was that such leases be measured at fair value leading to recognition of the implicit subsidy (the difference between the market value and the lease contract value) in both lessees' and lessors' financial statements.

Feedback from Constituents on ED 64, *Leases*

BC16. The IPSASB received 39 comment letters in response to ED 64. This feedback indicated that:

(a) The vast majority of respondents agreed with the right-of-use model for lessee accounting. Many respondents who agreed with the proposals noted that their thinking was generally consistent with IPSASB's reasoning set out in the Basis for Conclusions to ED 64.

(b) Respondents that disagreed or partially agreed with the right-of-use model for lessees were of the view that:

(i) The proposed model was too complicated, costly and focused on the statement of financial position;

(ii) The right-of-use model for lessee accounting by itself was inadequate for public sector reporting because the IPSASB did not consider sufficiently the allocations of rights, which pertain to physical and intangible assets, which are prevalent in the public sector;

(iii) An exemption should be provided for leases between public sector entities; and

(iv) Guidance should be provided on the recognition and measurement of the transferred asset at the end of the lease term.[3]

(c) Respondents were almost equally divided over whether a departure from IFRS 16 lessor accounting was justified, with a small majority supporting departure. Generally, those in support of IFRS 16 lessor accounting, were of the view that the IPSASB had not made a strong enough case to depart from IFRS 16. On the other hand, those supporting departure from IFRS 16 lessor accounting on conceptual grounds agreed with the IPSASB's reasoning set out in the Basis for Conclusions, but did not agree consistently with the proposals for lessor accounting set out in ED 64.

(d) Respondents that did not agree with ED 64 proposals for lessor accounting did not have a unified view on the approach that should be adopted for lessor accounting and proposed a number of alternatives. The lack of consensus among respondents on the economics of, and accounting for, leases by lessors highlighted significant differences across jurisdictions.

(e) Respondents were of the view that the IPSASB needed to address public sector specific issues related to leases (for example, concessionary leases, access rights, and other types of arrangements in the public sector, etc.). However, respondents provided diverse views on how to address these public sector specific issues.

IPSASB's Response to Constituents' Feedback on ED 64, Leases

IPSASB Consultative Advisory Group

BC17. After considering constituents' feedback on ED 64, at the December 2018 CAG meeting the IPSASB sought CAG's views on actions to move the Leases project forward in light of the responses to ED 64.

BC18. The CAG advised the IPSASB that at this stage of the Leases project it would be in the public interest to:

(a) Slow down the Leases project by extending its timeline to better understand the issues raised by respondents to ED 64;

(b) Further consider alignment with IFRS 16 regarding lessor accounting; and

(c) Focus on public sector differences related to lease transactions.

Other IPSASB initiatives

BC19. The IPSASB decided to:

(a) Create a Task Force in December 2018, with members from several jurisdictions, including preparers, users, auditors and standard-setters, to undertake an in-depth review of all constituent comments; and

(b) Invite guest speakers to the June and September 2019 IPSASB meetings to provide their views on lease accounting and the implementation challenges of applying IFRS 16 in both the private and public sectors. Speakers included national standard-setters, auditors, preparers and the statistical accounting community.

BC20. The guest speakers highlighted that the new lessee accounting model in IFRS 16 was raising significant implementation issues in both the private and public sectors. The IPSASB considered that leases are a very common transaction in the public sector, and that any changes on how to account for leases would have similar or greater implementation cost and challenges for the public sector. IFRS 16 also presents significant conceptual and practical challenges for the statistical community.

[3] See paragraph BC27.

New Approach to the Leases Project

BC21. In the light of these presentations and the responses to ED 64, in March 2020 the IPSASB decided to revisit its overall approach to the Leases project, and to adopt a phased approach as follows:

(a) Phase One, dealing with lease accounting model(s) for both lessees and lessors based on the same definition of a lease as in IFRS 16; and

(b) Phase Two, dealing with public sector specific issues, such as concessionary leases, access rights, and other types of arrangements in the public sector. The IPSASB also decided to issue a 'Request for Information' to better inform this Phase Two work.

BC22. In determining how to approach the first phase of the project, the IPSASB discussed whether it should consider a variant to IFRS 16 lessor accounting that would require all lessors to account for leases as operating leases only. The aim of this variant would be to deal with the concern raised by respondents regarding the non-recognition of the underlying asset by both the lessor and the lessee if the lessor classifies the lease as a finance lease.

BC23. The IPSASB decided not to proceed with this IFRS 16 variant for lessors because:

(a) Requiring operating lease accounting for all lessor transactions would remove the judgement by preparers that is inherent to the risks and rewards model and would transform it into a rules-based model without sufficient economic rationale;

(b) It would create consolidation issues where both lessor and lessee are part of the same economic entity applying IPSAS; and

(c) It would create mixed group[4] issues where some commercial public sector entities apply IFRS Standards but are controlled by public sector entities that apply IPSAS. Different requirements are costly to those applying IPSAS when there is no public sector specific reason to develop different accounting treatments.

Three Strategic Options for the Leases Project

BC24. After making this decision, the IPSASB discussed three strategic options:

(a) Option 1 – Retain IPSAS 13, which would pause the project;

(b) Option 2 – Proceed with the right-of-use model for lessees and risks and rewards model for lessors in developing a Standard aligned with IFRS 16; or

(c) Option 3 – Proceed with the right-of-use model for both lessees and lessors and develop a Standard based on ED 64.

BC25. In order to make this strategic decision on the overall future direction of the project, the IPSASB considered the following six factors alongside the public interest:

(a) Public Financial Management (PFM) [5] benefits;

---

[4] Mixed groups are groups that encompass public sector entities that apply IPSAS and commercial public sector entities that apply IFRS Standards.

[5] Defined in *The CIPFA FM Model, Statements of Good Practice* as "Public Financial Management is the system by which financial resources are planned, directed and controlled to enable and influence the efficient and effective achievement of public service outcomes." This definition is aligned with the principles in the *IFAC/CIPFA International Framework: Good Governance in the Public Sector* (see https://www.ifac.org/knowledge-gateway/contributing-global-economy/publications/international-framework-good-governance-public-sector)

(b) Implementation costs and challenges—training, information technology changes, change of processes, accounting changes (first-time implementation of new Standard), and on-going accounting (maintenance);

(c) Government Finance Statistics (GFS) alignment—at the conceptual level, when comparing IPSAS and GFS accounting frameworks, and at the practical level, when compiling GFS accounts using information from accrual-based IPSAS accounts;

(d) IPSASB's *Conceptual Framework*—public sector financial reporting objectives of accountability and decision-making, and whether transactions and events meet the definition of elements[6];

(e) IFRS Alignment—alignment with IFRS 16; and

(f) Feasibility of the Leases project—timeliness, and impact on project management, IPSASB's resource allocation, and IPSASB's Work Program.

BC26. The IPSASB first considered whether to pause with the leases project by retaining IPSAS 13 (Option 1). The IPSASB was of the view that retaining IPSAS 13 would be the least favorable option in terms of PFM benefits, consistency with the IPSASB's *Conceptual Framework* and IFRS Alignment because it would:

(a) Continue to allow off-balance sheet financing of operating leases for lessees;

(b) Create mixed group issues where some controlled entities are required to apply IFRS Standards;

(c) Result in some cases the underlying asset not being recognized by either the lessee or the lessor, or being recognized by both;

(d) Be inconsistent with the control-based approach to asset recognition and derecognition in the IPSASB's *Conceptual Framework*; and

(e) Retain an accounting model that differs from that in IFRS 16 for both lessees and, to a lesser extent, lessors[7].

BC27. During its discussion of Option 1, the IPSASB also considered the comments made by respondents that disagreed or partially agreed with the right-of-use model for lessees (see paragraphs BC16(b)(i)–BC16(b)(ii)). The IPSASB concluded that the respondents' concerns were not public sector specific and, therefore, did not warrant a departure from IFRS 16. The IPSASB also concluded that the benefits of the right-of-use model for lessees would outweigh the costs of the accounting changes as there would be a number of simplifications, such as:

(a) Providing a single accounting model for lessees which would remove the different lease classifications in IPSAS 13;

(b) Permitting a lessee not to recognize assets and liabilities, for short-term leases and leases of low-value assets;

(c) Permitting application of the Standard by entities on a portfolio basis for leases with similar characteristics;

(d) Simplifying the measurement requirements for lease liabilities, in particular the requirements for variable lease payments, payments during optional periods and the reassessment of lease liabilities;

---

6 The main difference between the three options is related to recognition of elements and how this impacts accountability and decision-making.

7 For lessees, IPSAS 13 includes the risks and rewards incidental to ownership model and IFRS 16 includes the right-of-use model. For lessors, IFRS 16 changed the risks and rewards incidental to ownership model compared to IAS 17 (the Standard from which IPSAS 13 was drawn primarily) because it made changes to the requirements for subleases, lease modifications, initial direct costs, variable lease payments, and disclosures.

(e) Establishing requirements for separating lease and non-lease components included in the same contract;

(f) Establishing lessee disclosure requirements focused on the most significant features of their lease portfolios; and

(g) Simplifying lessee transition requirements.

BC28. Consequently, the IPSASB decided that it would be in the public interest not to proceed with Option 1, and so to replace IPSAS 13 with a new Standard.

BC29. The IPSASB then considered whether to proceed with Option 2 (an IFRS 16-aligned Standard) or to proceed with Option 3 (ED 64) by applying the six factors outlined in paragraph BC25. Since the main difference between these two options was the lessor accounting model, this was the focus for the Board's discussions, and therefore the paragraphs below focus on lessor accounting, except where otherwise stated.

BC30. Regarding PFM benefits, it was not clear from the responses to ED 64 which option provides the greater overall benefits. For example, some respondents argued that the recognition of a liability would lead to increased financial leverage reflected in the lessor's statement of financial position. Therefore, this factor did not provide a clear indication of which option was preferable.

BC31. Option 3 would entail greater implementation costs and challenges than Option 2 because IFRS 16 substantially carried forward the lessor accounting model in IAS 17 (with which IPSAS 13 is aligned), making only relatively minor changes.

BC32. With respect to alignment with GFS, wherein the lessees and lessors both follow the concept of risks and rewards, the Option 2 accounting model would be aligned for lessors, but not for lessees. From a GFS perspective Option 2 would still require the use of surveys to obtain data on the underlying asset in a lease (when the lessor has a finance lease). However, Option 2 is currently being applied in the private sector and any additional statistical information or data processes required by GFS can be replicated in the public sector if the IPSASB chose this option. Under Option 3, the accounting model would not be aligned with GFS for both lessees and lessors.

BC33. Option 3, under which both the lessees and lessors would follow the concept of control, would be more consistent with the IPSASB's *Conceptual Framework*, while Option 2 would be less consistent with the IPSASB's *Conceptual Framework*[8].

BC34. On the other hand, Option 2 would be aligned with IFRS Standards, while Option 3 would not be so aligned.

BC35. From a project management perspective, Option 2 would have the advantage of being more straightforward and therefore more feasible than Option 3. Additionally, Option 3 would be more challenging from a project delivery perspective because of the probable continued variations in views in further developing the ED 64 lessor accounting proposals, which could therefore extend the project timeline.

BC36. After careful consideration of the respective arguments for and against the Options for each of the six factors, the IPSASB decided that, on balance, the public interest would be better served by proceeding with Option 2 (an IFRS 16–aligned Standard) because it would:

(a) Be less costly and challenging to implement by changing only lessee accounting, and the public sector could benefit from the private sector experience in implementing IFRS 16;

(b) Align with the IPSASB's Strategy & Work Plan strategic theme of Maintaining IFRS Alignment, which was an original objective of the Leases project;

[8] Where a Standard is developed that departs from the *Conceptual Framework*, the IPSASB explains the reasons.

(c) Address more quickly the important off-balance sheet financing of operating leases by lessees that IPSAS 13 permits, without waiting for a new accounting model for lessors; and

(d) Facilitate Phase One delivery, thus permitting the IPSASB to focus on Phase Two of the project, and so to address the important public sector specific issues described in paragraph BC21(b) in a more timely manner.

Exposure Draft (ED) 75, *Leases* and Request for Information

BC37. In January 2020, the IPSASB published:

(a) ED 75, *Leases* as part of Phase One of the Leases project; and

(b) Request for Information, *Concessionary Leases and Other Arrangements Similar to Leases* as part of the Phase Two of the Leases project.

BC38. The IPSASB received 48 and 37 comment letters in response to ED 75 and Request for Information, respectively.

BC39. The feedback received on the proposals in ED 75[9] indicated that:

(a) The majority of respondents agree or partially agreed with the ED 75 proposals for alignment with IFRS 16 and consequently with the right-of-use model for lessees[10] and risks and rewards model for lessors; and

(b) Some respondents who agreed with ED 75 noted that their thinking was generally consistent with IPSASB's reasoning set out in the Basis for Conclusions (BC) to ED 75. Other respondents agreed with ED 75 without providing additional reasons.

BC40. The IPSASB noted that the ED 75 proposals for lessor accounting have much stronger support from respondents when comparing with the ED 64 proposals, which received mixed support.

BC41. Some respondents, while agreeing with the ED 75 proposals for lessee and lessor accounting, provided minor points for further consideration by the IPSASB.

BC42. The few respondents that partially agreed or disagreed with ED 75 provided the following reasons:

(a) Exemption should be added for public sector entities to provide relief from applying the proposed accounting requirements for leases between entities of the public sector because of cost-benefit reasons;

(b) Accounting asymmetry between lessee and lessor;

(c) The underlying asset is recognized neither in the lessor's nor in the lessee's financial statements in the case of a finance lease from the lessor's perspective;

(d) Divergence with Government Finance Statistics (GFS) in lessee accounting;

(e) Scope of public debt for lessees;

(f) The Leases project should have a single phase;

(g) Continue adopting IPSAS 13; and

(h) Proposed model for lessees is too complicated, costly and concentrated on the statement of financial position

[9] The analysis of the responses to the Request for Information will be made in Phase Two of the Leases project.

[10] This feedback was consistent with ED 64 lessee accounting model aligned with IFRS 16, which was also supported.

BC43. The IPSASB considered the overall feedback received and concluded that the issues raised by respondents that partially agreed or disagreed with ED 75 were:

(a) Not public sector specific that warrant departure from IFRS 16; or

(b) Considered by the IPSASB during the development of ED 75 as set out in its Basis for Conclusions (see BC21–BC36).

BC44. Therefore, the IPSASB decided to proceed with the ED 75 proposals for lessee and lessor accounting, subject to addressing the minor points raised by respondents that in the view of the IPSASB would enhance ED 75.

IPSAS 43, *Leases*

BC45. This Standard is based on IFRS 16, *Leases* issued by the IASB. In accordance with existing practice, this Basis for Conclusions outlines only those areas where IPSAS 43 departs from the main requirements of IFRS 16, or where the IPSASB considered such departures taking into consideration the feedback received to ED 75.

Scope (see paragraph 3)

BC46. In developing ED 75, the IPSASB had considered whether to provide an explicit scope exclusion for concessionary leases. The IPSASB had decided not to provide that explicit scope exclusion because:

(a) IPSAS 13 does not have a scope exclusion for concessionary leases;

(b) ED 75 is an IFRS aligned Standard, and IFRS 16 does not exclude concessionary leases from its scope; and

(c) Any issues in applying ED 75 to concessionary leases, including the concession component, will be considered further in Phase Two of the Leases project (see paragraph BC21(b)).

BC47. In reaching this decision, the IPSASB had noted that ED 75 already addressed lease incentives paid by the lessor to the lessee to entice the lessee to enter into the lease. However, in this situation the lease incentives do not modify the nature of the lease as being a lease at market terms. The leases to be considered in Phase Two of the Leases project are concessionary leases where the lessor has the intention of providing a concession that modifies the nature of the lease into a lease at below-market terms.

Responses to ED 75, Leases

BC48. The majority of respondents to ED 75 supported the proposed scope based on the same reasons as set out in paragraph BC39.

BC49. The minority respondents who did not support the proposed scope in ED 75 commented that they would prefer to explicitly scope out concessionary lease because:

(a) The separation of the lease component requirement cannot be applied to leases with no consideration or the exchange is insignificant;

(b) It would help clarify whether ED 75 (measured at cost) or IPSAS 23 (measured at fair value) applies to concessionary leases;

(c) It would help clarify whether ED 75 or the future pronouncement based on the RFI apply to concessionary leases;

(d) Preparers may have to change their accounting treatment of concessionary leases in order to comply with ED 75 following Phase One, and later on have to again change their accounting treatment of

concessionary leases in order to comply with the pronouncement issued following Phase Two of IPSASB's Leases project.

BC50. The IPSASB considered the issues raised by the respondents and decided to proceed with the ED 75 proposals as the basis for IPSAS 43 due to:

(a) The reasons identified in paragraph BC46; and

(b) The issues raised by respondents to ED 75 were not persuasive enough to justify a different approach.

Definitions

Definition of a Lease

BC51. In developing ED 75, the IPSASB decided to adopt the IFRS 16 definition of a lease because it had not identified a public sector specific reason that warranted departure from IFRS 16.

Responses to ED 75, Leases

BC52. While the majority of respondents agreed with the ED 75 proposal, a few respondents suggested that the IPSASB should:

(a) Clarify the term consideration to refer to financial or nonfinancial consideration as public sector entities may also enter into lease contracts in exchange for consideration that is nonfinancial;

(b) Clarify the difference between concessionary leases and nominal leases and quantifying the value and the basis of a nominal lease from the definition of a lease perspective; and

(c) Amend the definition of a lease by adding the term "control the" before "use of an identified asset" to be consistent with the application guidance of ED 75.AG10 because inconsistent references to the right to use make it difficult to decide whether the analysis should focus on the right to use, the right to control the use or the right to direct the use."

BC53. The IPSASB noted that ED 75 deals with consideration in the form of cash flows because:

(a) The definition of a lease is linked to the definition of lease payments, and

(b) This approach is consistent with both IPSAS 13, *Leases* and IFRS 16, *Leases*.

BC54. The IPSASB also noted that Phase Two of the Leases project will address concessionary leases, which the Request for Information, *Concessionary Leases and Other Arrangements Similar to Leases* is part of.

BC55. The IPSASB considered the consistency between the definition of a lease and its application guidance. The IPSASB concluded that the application guidance in ED 75 clarifies the principle set out in the definition of a lease about conveying the right to use an identified asset by explicitly referring to the right to control the use of an identified asset, without the need to include it in the definition of a lease. The IPSASB noted that this approach is consistent with the approach in IFRS 16.

BC56. In conclusion, the IPSASB decided to retain the ED 75 proposals in IPSAS 43, *Leases* because it did not identify a public sector specific reason that would warrant a departure from IFRS 16.

Contractual Arrangements

BC57. In developing ED 75, the IPSASB had noted that, in certain jurisdictions, public sector entities are precluded from entering into formal contracts but do enter into arrangements that have the substance of contracts. These arrangements may be known by another term, e.g., a "government order." To assist entities in identifying contracts, which either have the substance or legal form of a contract, the IPSASB had considered

it appropriate to issue additional Application Guidance explaining the factors an entity should consider in assessing whether an arrangement is contractual or non-contractual.

BC58. Consideration was given to whether the term “binding arrangement” should be used to describe the arrangements highlighted in paragraph AG3. The term “binding arrangement” is defined in IPSAS 32, *Service Concession Arrangements: Grantor* as contracts and other arrangements that confer similar rights and obligations on the parties to it as if they were in the form of a contract. For example, an arrangement between two government departments that do not have the power to contract may be a binding arrangement. The IPSASB had concluded that the term “binding arrangements,” as used in IPSAS, embraces a wider set of arrangements than those identified in paragraph AG3 and therefore concluded that it should not be used in this Standard. Entities in a binding arrangement would enforce their rights and obligations through legal (enforceable through judicial system) or equivalent means (enforceable through cabinet and ministerial directives, executive authority, or other means that are similar). However, entities in a contract would enforce their rights and obligations only through legal means (i.e., by law, through judicial system).

Responses to ED 75, Leases

BC59. ED 75 specifically referred to contracts in the definition of a lease. Although the majority of respondents agreed with the ED 75 proposals, some respondents disagreed with limiting the definition of a lease to contracts because it would scope out from the final IPSAS on Leases types of arrangements that are not contracts, but are prevalent in the public sector because:

(a) There might not be willing parties to the arrangement; or

(b) Many public sector entities do not have the power to enter into contracts but enter into binding arrangements that confer similar rights and obligations on the parties as if they were a form of contract.

BC60. As a result of these concerns, the IPSASB decided to clarify that IPSAS 43 is designed only for transactions that have the three elements identified in paragraph AG3.

BC61. As noted in BC58, the IPSASB differentiated contracts as enforced by legal means whereas binding arrangements are enforced by legal or equivalent means. A transaction that does not have willing parties is neither a contract nor a binding arrangement.

BC62. As a result, the IPSASB decided to retain the term “contract” in the definition of a lease in IPSAS 43.

Initial Direct Costs

BC63. The IPSASB decided not to include the IFRS 16 requirements for a manufacturer or dealer lessor (see paragraph BC93) in IPSAS 43. Therefore, the IFRS 16 definition of ‘initial direct costs’ has also been amended to remove the reference to a manufacturer or dealer lessor.

Fair Value

BC64. In developing ED 75, the IPSASB had considered whether to retain the fair value definition consistent with IFRS 16 and IPSAS 13 or to include the fair value definition consistent with ED 77.

BC65. The IPSASB had noted that including the fair value definition consistent with ED 77 might significantly change the lease classification and the timing of recognizing gains or losses for sale and leaseback transactions.

BC66. Therefore, the IPSASB had decided to retain the fair value definition consistent with IFRS 16 because:

(a) It is consistent with the IPSASB’s March 2020 decision to retain the IPSAS 13 lessor requirements and align with IFRS 16 for cost-benefit reasons (see paragraph BC36); and

(b) It is consistent with the IASB's decision to retain in IFRS 16 the fair value definition that existed in IAS 17, as the previous lessor accounting model in IAS 17 was not fundamentally flawed and should not be changed.

Responses to ED 75, *Leases*

BC67. While the majority of respondents agreed with the ED 75 proposals, some respondents disagreed with the retention of the fair value definition from IFRS 16, *Leases* and IPSAS 13, *Leases* in ED 75 because:

(a) Of the possible confusion for users and preparers of having two different fair value definitions in IPSASB's literature;

(b) Sale and leaseback transactions (where the definition of fair value is used) occur infrequently in the public sector;

(c) Of the benefits of the consistent use of terminology in IPSASB literature; and

(d) Most countries are still in the process of implementing IPSAS and, therefore, the change to the ED 77 fair value definition would not cause significant change for their accounting system.

BC68. The IPSASB decided to retain the ED 75 fair value definition in IPSAS 43 because there was no compelling public sector reason to depart from IFRS 16.

Identifying a Lease

BC69. In developing ED 75, the IPSASB had considered whether to refer to both "economic benefits" and "service potential" in the application guidance section in ED 75 on identifying a lease, rather than "economic benefits" alone.

BC70. If the guidance referred only to "economic benefits", the IPSASB had noted that an entity that intends to use the identified asset to provide services to the community might reach the conclusion that the transaction is not a lease because it does not derive economic benefits from the use of that asset, despite the fact that the transaction meets the definition of a lease in ED 75.5. Therefore, the IPSASB had decided to add the term "service potential" in the application guidance section on identifying a lease, where appropriate.

BC71. In reaching this conclusion, the IPSASB had also noted that this approach is consistent with *The Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities* (2014) in referring to assets in terms of both economic benefits and service potential.

Responses to ED 75, *Leases*

BC72. All respondents to ED 75 supported referring to both "economic benefits" and "service potential" in the application guidance section on identifying a lease, rather than "economic benefits" alone.

BC73. Based on a respondent's suggestion, the IPSASB decided to extend this approach, where appropriate, to the Illustrative Examples. In doing so, the IPSASB's rationale was to refer to "service potential" in all illustrative examples that have generic references to the benefits of the lease.

Lessee Accounting

Recognition Exemptions

BC74. The IPSASB considered the recognition exemptions in IFRS 16. The IPSASB did not identify a public sector specific reason that would warrant different recognition exemptions in this Standard.

BC75. The IPSASB also considered whether the permissible recognition exemptions in IFRS 16 should be a requirement or an option in this IPSAS. The IPSASB noted that, according to the IASB's research, leases of low-value assets represent less than 1% of total non-current assets. In this context, the IPSASB considered

that, on the one hand, making the recognition exemptions a requirement rather than an option would enhance the comparability between public sector entities and provide increased cost relief to them, with a low probability of a negative impact on the reliability and accuracy of financial statements. However, on the other hand, the IPSASB noted that requiring recognition exemptions for short-term leases may create a new arbitrage point, where entities could design their lease contracts to achieve desired accounting outcomes.

BC76. On balance, the IPSASB concluded that there was no public sector specific reason to require rather than permit recognition exemptions. The IPSASB also considered that, by not requiring the application of the exemptions, public sector entities would be able to adopt an approach that appropriately provides a faithful representation of leasing transactions in terms of their own statements of financial position.

BC77. The IPSASB noted that IFRS 16 does not set a specific monetary amount for a lease of a low-value asset. Instead, the IASB included in paragraph BC100 of the Basis for Conclusions: “the IASB had in mind leases of underlying assets with a value, when new, in the order of the magnitude of US$5,000 or less”. The IPSASB considered whether it was appropriate for public sector financial reporting to use the same or a different dollar amount, or not make any reference to a threshold in the Basis for Conclusions of this Standard.

BC78. The IPSASB acknowledged that, for many public sector entities that are services-based, a figure of US$5,000 might represent the value of most of their individual assets. The IPSASB concluded that public sector entities, if they decide to apply the exemption, should use a threshold for determining leases of low-value assets, considering the materiality of leasing transactions in relation to their financial statements. The IPSASB concluded that it would not provide guidance on a specific monetary amount. In assessing materiality, preparers consider whether the omission of information could influence financial statement users’ assessments of accountability or their decision-making.

Responses to ED 75, *Leases*

BC79. In determining a dollar amount for leases of low-value assets, the IPSASB considered the following feedback received on ED 75:

(a) There is an apparent inconsistency between the application guidance on leases of low value assets that refers to an assessment on an absolute basis and the Basis for Conclusions where it refers to an assessment in terms of materiality; and

(b) There is no public sector specific reason for public sector entities not to benefit from the same monetary amount to guide entities in applying the exemption.

BC80. Based on the feedback received, the IPSASB concluded that public sector entities, if they decide to apply the exemption, should use a threshold for determining leases of low-value assets, considering the guidance in IPSAS 43.AG4–AG9. The IPSASB noted that the exemption is to apply to leases for which the underlying asset, when new, is of low value. A lease will not qualify for the exemption if the nature of the underlying asset is such that, when new, its value is typically not low.

BC81. The IPSASB concluded that it would not provide a specific monetary amount in the Basis for Conclusions because the application guidance already provides guidance for applying the requirements consistent with IFRS 16. The IPSASB decided that the outcome of the assessment of whether an underlying asset is of low value should not be affected by the size, nature, or circumstances of the lessee—i.e., the exemption is based on the value, when new, of the asset being leased; it is not based on the size or nature of the entity that leases the asset.

Discount Rate

BC82. In developing ED 75, the IPSASB had considered whether to provide additional guidance where:

(a) The lessee’s incremental borrowing rate is different from the likely interest rate implicit in the lease; or

(b) The lessee is unable to determine the interest rate implicit in the lease or has difficulties in determining the incremental borrowing rate.

BC83. The IPSASB had decided that this issue is not public sector specific because private sector entities encounter similar difficulties in determining the implicit rate in the lease and the incremental borrowing rate.

BC84. The IPSASB had noted that the incremental borrowing rate can be determined by:

(a) Taking into account the terms and conditions of the lease;

(b) Referring to a rate that is readily observable as a starting point (for example, the rate that a lessee has paid, or would pay, to borrow money to purchase the type of asset being leased, or the property yield when determining the discount rate to apply to property leases); and

(c) Adjusting such observable rates as is needed to determine the lessee's incremental borrowing rate as defined in ED 75.

Responses to ED 75, *Leases*

BC85. While the majority of respondents agreed with the ED 75 proposals, a few respondents suggested including some guidance on determining the discount rate because of:

(a) Difficulties in determining the implicit rate in the lease, where public sector entities have challenges in accessing borrowings to determine the incremental borrowing rate;

(b) Differences between real and nominal interest rates in non-developed countries with high inflation; and

(c) The lack of guidance on the meaning of "similar value" in the definition of lessee's incremental borrowing rate.

BC86. The IPSASB decided to proceed with the proposals in ED 75 and not provide additional guidance on the discount rate because:

(a) Lack of incremental borrowing rate is also prevalent in the private sector;

(b) The IPSASB has already clarified in BC84 how to identify an appropriate incremental borrowing rate based on similar transactions; and

(c) Differences between real and nominal interest rates are not a public sector specific issue.

COVID-19 Requirements

BC87. In developing ED 75, the IPSASB had included the 2020 amendments to IFRS 16 for COVID-19-related rent concessions. The IPSASB was of the view that the inclusion of these requirements might be useful to preparers and users of general purpose financial reports (GPFRs) because of the uncertain duration and future impacts of the pandemic.

Responses to ED 75, *Leases*

BC88. While the majority of respondents agreed with the ED 75 proposals, a few respondents suggested that these requirements should be applicable to pandemics in general due to the:

(a) Applicability of these requirements may be overtaken by events and therefore will be of no value to the preparers and users of GPFRs; and

(b) Delayed effective dates of other IPSAS.

BC89. The IPSASB noted that the IASB also considered the risk of the practical expedient being applied too broadly, which could result in unintended consequences. Therefore, the IASB decided to limit the scope of the

practical expedient so that it applies only to rent concessions that occur as a direct consequence of the COVID-19 pandemic if other conditions are met.

BC90. Additionally, some respondents suggested changing the date until which the practical expedient can be applied because it will date the Standard and will limit the duration affected by COVID-19. In the end, having the same affected period for all might not work because it might not be the case for everyone.

BC91. The IPSASB noted that, in March 2021, the IASB published Covid-19-Related Rent Concessions beyond 30 June 2021 (Amendments to IFRS 16). In this publication, the IASB only extended the date of the practical expedient to end on June 30, 2022—it did not introduce either a new practical expedient or a new option to apply (or not apply) the practical expedient. The IASB only wanted these requirements to be applicable to the COVID-19 pandemic by providing a single criterion to be applicable in all jurisdictions.

BC92. The IPSASB decided to retain the ED 75 proposals in IPSAS 43 because it did not identify a public sector specific reason that would warrant a departure from IFRS 16.

Lessor Accounting

Manufacturer or Dealer Lessors

BC93. The IPSASB decided not to include in this Standard the manufacturer or dealer lessor requirements included in IFRS 16 because:

(a) They are not expected to be applied to public sector entities for which IPSAS are designed; and

(b) The IPSASB's constituents did not request its inclusion during consultation on ED 64, which also excluded those requirements.

Responses to ED 75, *Leases*

BC94. While respondents strongly agreed with the ED 75 proposal, one respondent was of the view that the rationale for excluding manufacturer or dealer lessor requirements was not persuasive because although it might not be expected, the public sector is not prohibited from manufacturing or dealing activities.

BC95. The IPSASB recognizes that the relative importance of manufacturer or dealer lessors requirements might vary across jurisdictions. However, the IPSASB decided to proceed with the ED 75 proposal to exclude the manufacturer or dealer lessors requirements in IPSAS 43 because of the:

(a) Reasons identified in paragraph BC93;

(b) Overwhelming support for the ED 75 proposal.

BC96. In reaching this conclusion, the IPSASB noted that if a public sector entity does have manufacturer or dealer lessor arrangements, they could follow IFRS 16 under the hierarchy in IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*.

Intermediate Lessors

Responses to ED 75, *Leases*

BC97. While respondents strongly agreed with the ED 75 proposal, one respondent suggested that the IPSASB consider adding guidance related to the scenario where there is a head lease with fixed payments and a sublease with variable lease payments linked to sales, when both have the same lease period. This respondent was of the view that judgements may differ on whether the lease should be classified as an operating lease or a finance lease by the intermediate lessor. A further consideration was related to the recognition of profit and loss related to the right-of-use asset at the commencement date of the sublease.

BC98. The IPSASB decided to proceed with the ED 75 proposals in IPSAS 43 because the IPSASB did not identify a public sector specific reason to depart from the IFRS 16 requirements for intermediate lessors.

Cross-Reference to IFRS 15 Revenue from Contracts with Customers

BC99. When developing this Standard, the IPSASB decided to refer to IFRS 15 instead of the relevant national or international accounting standard dealing with revenue from contracts with customers, where appropriate, because it is consistent with the:

(a) Control-based approach to lessee accounting in IPSAS 43; and

(b) IFRS 16 reference to IFRS 15 in the corresponding requirements.

BC100. In reaching this decision, the IPSASB noted that these references will be updated when the new IPSAS 47, *Revenue* is issued.

Effective Date

BC101. The IPSASB decided that IPSAS 43 should have an effective date of annual financial statements covering periods beginning on or after January 1, 2025, with earlier application permitted.

BC102. In deciding the effective date, the IPSASB considered that:

(a) IFRS 16 also had a three-year period for its application;

(b) IPSAS 41, *Financial Instruments* will be effective in January 1, 2023, which will add to the workload for preparers before having to apply IPSAS 43;

(c) It provides sufficient time for the IPSASB to finalize the new IPSAS 47 and other IPSAS under development in the IPSASB's Work Program, which may have consequential amendments to IPSAS 43;

(d) It allows the IPSASB time to finish Phase Two of the Leases project; and

(e) It allows public sector entities time to identify the impacts of and to prepare for the implementation of the new Leases Standard.

BC103. The IPSASB decided to permit the earlier application of IPSAS 43, instead of encouraging it, because, ideally, the Standard should be applied together with the new IPSAS 47 aligned with IFRS 15.

BC104. The IPSASB noted during the development of this Standard that, for those public sector entities that elect to apply IPSAS 43 early, there might be greater complexity in analyzing revenue transactions under different principles: some lease transactions would be accounted for according to the principles in IFRS 15, while the revenue from other non-lease transactions will still be accounted for according to the principles in IPSAS 9, *Revenue from Exchange Transactions*, until the IPSASB publishes a new IPSAS on Revenue. However, cross-referencing to IFRS 15, where appropriate for revenue recognition, provides a temporary solution that allows public sector entities to prepare for the future changes that might be required when the IPSASB completes its Revenue project and issues the new IPSAS 47.

Revision of IPSAS 43 as a result of *Improvements to IPSAS, 2023*

BC105. The IPSASB reviewed the revisions to IFRS 16, *Leases*, included in *Interest Rate Benchmark Reform—Phase 2* (Amendments to IFRS 9, IAS 39, IFRS 7, IFRS 4 and IFRS 16) issued by the IASB in August 2020, and the IASB's rationale for making these amendments as set out in its Basis for Conclusions, and generally concurred that there was no public sector specific reason for not adopting these amendments, henceforth labeled as *Interest Rate Benchmark Reform—Phase 2* amendments.

BC106. The IPSASB reviewed the revisions to IPSAS 43, Leases, included in *Lease Liability in a Sale and Leaseback* (Amendments to IFRS 16) issued by the IASB in September 2022, and the IASB's rationale for making these amendments as set out in its Basis for Conclusions, and generally concurred that there was no public sector specific reason for not adopting these amendments, henceforth labeled as *Lease Liability in a Sale and Leaseback* amendments.

Revision of IPSAS 43 as a result of *Concessionary Leases and Other Arrangements Conveying Rights over Assets* (Amendments to IPSAS 43, IPSAS 47, and IPSAS 48) issued in October 2024

Introduction

BC107. In January 2021, the IPSASB issued the Request for Information (RFI), *Concessionary Leases and Other Arrangements Similar to Leases*. The RFI included a set of arrangements similar to leases that are common in the public sector[11].

BC108. Based on the information received from respondents to the RFI, in January 2023, the IPSASB issued Exposure Draft (ED) 84, *Concessionary Leases and Right-of-Use Assets In-kind* (Amendments to IPSAS 43 and IPSAS 23). ED 84 proposed new public sector specific accounting requirements for two of the six types of arrangements identified in the RFI. Regarding the RFI remaining arrangements, the IPSASB had taken the view that the applicable IPSAS at the time of publication of ED 84 already provided the principles on how to account for those arrangements.

BC109. During the review of responses to ED 84, the IPSASB noted that some respondents raised some issues that were related to arrangements that do not meet the definition of a lease or a right-of-use asset in-kind. The IPSASB also noted that this may be related to the fact that ED 84 did not propose accounting for the remaining types of arrangements included in the RFI that do not meet the definition of a lease or right-of-use asset in-kind. Therefore, respondents did not have a comprehensive view on the accounting for these types of arrangements that convey rights over assets.

BC110. In May 2023, the IPSASB published IPSAS 45, *Property, Plant, and Equipment*[12], IPSAS 46, *Measurement*, IPSAS 47, *Revenue*[13], and IPSAS 48, *Transfer Expenses*. As IPSAS 47 supersedes IPSAS 23, the ED 84 proposals of amendments to IPSAS 23 will no longer be applicable from 2026 onwards.

BC111. In March 2024, the IPSASB published ED 88, *Arrangements Conveying Rights over Assets* (Amendments to IPSAS 47 and IPSAS 48) with proposed authoritative and non-authoritative guidance for lessees in IPSAS 47 for the concession in concessionary leases update the proposals in ED 84 related to IPSAS 23, as well as non-authoritative proposals to update IPSAS 48 with guidance on other arrangements conveying rights over assets.

BC112. This Basis for Conclusions present the IPSASB's main considerations and decisions when developing *Concessionary Leases and Other Arrangements Conveying Rights over Assets* (Amendments to IPSAS 43, IPSAS 47, and IPSAS 48), regarding the amendments to IPSAS 43 including respondents' feedback to ED 84.

---

[11] The Request for Information included six types of arrangements, as follows: (i) Concessionary Leases, (ii) Leases for Zero or Nominal Consideration, (iii) Access Rights (or Rights of Access to Property and/or Land), (iv) Arrangements Allowing Right-of-Use, (v) Social Housing Rental Arrangements, and (vi) Shared Properties with or without a Lease-Arrangement in Place.

[12] IPSAS 45 will be effective on January 1, 2025, and supersedes IPSAS 17, *Property, Plant, and Equipment*.

[13] IPSAS 47 will be effective on January 1, 2026, and supersedes IPSAS 9, *Revenue from Exchange Transactions*, IPSAS 11, *Construction Contracts*, and IPSAS 23, *Revenue from Non-Exchange Transactions (Taxes and Transfers)*.

Definitions

BC113. The IPSASB reconsidered whether to modify the definition of a lease to include other types of arrangements that are not contracts.

BC114. The IPSASB decided not to extend the definition of a lease to non-binding arrangements because a lease includes enforceable rights and enforceable obligations for the lessor and lessee; a non-binding arrangement does not.

BC115. Regarding binding arrangements that are not contracts, the IPSASB, when developing IPSAS 43, decided to expand the types of arrangements within the scope of the definition of a contract by adding paragraph AG3 and clarifying that IPSAS 43 is designed only for arrangements that:

(a) Are in substance a contract rather than having the legal form of a contract; and

(b) Have the following three elements:

(i) Willing parties;

(ii) Rights and obligations for the parties to the contract; and

(iii) The remedy for non-performance is enforceable by law.

BC116. The fundamental difference between the definition of a contract in IPSAS 43 and the definition of a binding arrangement is that in the latter the enforceability is broader and includes "equivalent means". In other words, binding arrangements are enforceable both within and outside the legal system, whereas contracts are enforceable only within the legal system. Enforceability through equivalent means is the presence of enforcement mechanisms outside of the legal system, that is similar to the force of law without being legal in nature, such as statutory mechanisms, legislative or executive authority, and cabinet or ministerial directives.

BC117. The IPSASB's Conceptual Framework acknowledges that there are jurisdictions where government and public sector entities cannot enter into legal obligations, because, for example, they are not permitted to contract in their own name, but where there are alternative processes with equivalent effect to enforce the rights and obligations in those arrangements.

BC118. Sometimes in the public sector, there are binding arrangements that, although conveying the right to use an underlying asset, are not, in substance, contracts. For example:

(a) One or both parties to the arrangement are not a willing party (for example: a government conveys to another party the right to use an underlying asset on a unilateral basis);

(b) The enforceable rights and obligations did not arise from a contract (for example: the rights and obligations are stipulated by a government unilaterally); and

(c) Binding arrangements with enforceability mechanisms outside of the legal system (for example, enforcement achieved through executive authority, either cabinet or ministerial directives).

BC119. By extension, when entities have arrangements as described in paragraph BC116, the IPSASB noted that they should not apply IPSAS 43 because:

(a) Those arrangements are not, in substance, contracts, as leases are contractual arrangements by nature; and

(b) IPSAS 43 was designed for arrangements that are in substance lease contracts, provided that the arrangement conveys the right to obtain substantially all of the economic benefits or service potential from the use of the identified asset and the right to direct the use of the identified asset[14].

[14] IPSAS 43 introduced extensive application guidance on the assessment of both rights.

BC120. Therefore, the IPSASB decided to retain the definition of a lease as contractual arrangements in IPSAS 43 because:

(a) IPSAS 43 is designed to be applicable only to leases that are, in substance, contracts; and

(b) It is consistent with IPSAS 41, *Financial Instruments*, which is also only applicable to contracts.

BC121. The IPSASB also considered whether to provide a definition or a description of a concessionary lease. The IPSASB noted that concessionary leases may vary depending on the level of consideration being exchanged, which may make them at below-market terms. In these cases, professional judgment may be required to assess whether, in substance, the transaction meets the definition of a lease or whether it is, in substance, a revenue transaction as a whole.

BC122. The IPSASB decided to provide a description rather than a definition of a concessionary lease because:

(a) It prevents an apparent contradiction of labelling as a lease an arrangement that conveys the right to use an underlying asset without the exchange of consideration; and

(b) It is consistent with the approach in IPSAS 41, *Financial Instruments*, where concessionary loans are not defined, but only described.

BC123. The IPSASB noted that there are transactions that convey the right to use an underlying asset without consideration (right-of-use asset in-kind). The IPSASB is of the view that transactions that convey the right to use an underlying asset without consideration do not meet the definition of a lease as defined in IPSAS 43.

BC124. The IPSASB concluded that a transaction that conveys a right-of-use asset in-kind is in substance a revenue transaction and, therefore, the principles in IPSAS 23, *Revenue from Non-Exchange Transactions* (Taxes and Transfers) and IPSAS 47, *Revenue* are applicable to this type of transaction.

Responses to ED 84, Concessionary Leases and Right-of-Use Assets In-kind

BC125. While respondents strongly agreed with ED 84 proposals, a few respondents suggested:

(a) Expanding the definition of a lease to include binding arrangements that are not contracts for consistency with IPSAS 47 and IPSAS 48, Transfer Expenses; and

(b) Introducing new definitions on varied topics or adding more guidance related to the proposed definitions.

BC126. The IPSASB considered the reasons raised by the respondents and decided to proceed with the ED 84 proposals on keeping the definition of a lease limited to contracts and not adding new definitions for consistency with current IPSAS.

Identification, Classification, and Scope of Concessionary Leases

BC127. IPSAS 43 introduced new guidance on identifying a lease as a result of an exchange transaction. Building on this guidance, the IPSASB proposed additional guidance to identify, classify, and scope concessionary leases.

BC128. The IPSASB proposed this new guidance because it would help preparers:

(a) Distinguish leases at market terms from leases that have embedded concessions;

(b) Understand the relationship between IPSAS 43 and other IPSAS; and

(c) Apply the IPSAS 43 principles to leases at market terms and apply the principles in other IPSAS to the concessions, as appropriate.

BC129. The IPSASB considered whether to include additional specific guidance on variable lease payments other than those referred in IPSAS 43 when identifying and classifying leases at market or at below-market terms. Lease payments that are dependent on a lessee's sales might influence the identification of a concessionary lease.

BC130. The IPSASB decided not to include this additional guidance in IPSAS 43 because it is not prevalent in the public sector.

BC131. The IPSASB also considered the role of lease modifications when identifying and classifying leases at market or at below-market terms.

BC132. The IPSASB decided not to include additional guidance on lease modifications because an entity needs to apply professional judgment when assessing the conditions in IPSAS 43.

Responses to ED 84, *Concessionary Leases and Right-of-Use Assets In-kind*

BC133. The majority of respondents to ED 84 supported the proposed guidance on identification, classification, and scope.

BC134. Some respondents who did not support ED 84 proposals suggested providing additional guidance on:

(a) Other types of arrangements that convey the right to use an underlying asset in order to have a holistic approach;

(b) Arrangements that convey the right to use that (i) are binding arrangements, but are not in-substance contracts, or (ii) are not binding arrangements;

(c) What constitutes a condition or compliance obligation in the context of a concessionary lease in IPSAS 23; and

(d) Arrangements involving unwilling parties.

BC135. The IPSASB considered the issues raised by respondents and decided to proceed with ED 84 proposals because the respondents' suggestions are outside of the scope of IPSASB's project that led to the development of ED 84.

BC136. A respondent suggested providing a scope exclusion:

(a) Based on significance to public sector accountability (such as those where one party to the lease is a commercial entity); and

(b) Between entities within the same public sector group.

BC137. The IPSASB considered the above suggestions and decided not to provide scope exclusions based on specific characteristics of the entities because it impairs accountability and decision-making: the impact of receiving resources at below-market terms would no longer be visible in the financial statements and the accountability mechanisms may also be applied at entity level, not only at group level on consolidation.

BC138. A respondent suggested providing guidance on right-of-use assets in kind in a single Standard.

BC139. The IPSASB considered the above suggestion and decided to proceed with ED 84 proposals in two Standards because the scope of IPSAS 43 and IPSAS 23[15] was not meant to be changed, and ED 84 proposals need to be consistent with the current scoping of IPSAS. The IPSASB notes that some of the guidance provided to concessionary leases can also be applicable to right-of-use assets in-kind.

[15] The IPSASB carried over this decision to ED 88 with separate proposals for IPSAS 47, which was then carried over to *Concessionary Leases and Other Arrangements Conveying Rights over Assets*.

BC140. Several respondents made suggestions about the proposed application guidance sections on classification of concessionary leases, including the diagrams and the role of consideration in the arrangements. These respondents were of the view that the diagram for lessors was confusing as the lessor did not recognize the non-exchange component and made several drafting suggestions.

BC141. The IPSASB considered these views and decided to enhance the application guidance section on identifying concessionary leases and the terminology in the diagram for lessees. The IPSASB also decided to remove the diagram for lessors because there is no:

(a) Change in the accounting for concessionary leases for lessors compared to leases at market terms; and

(b) Accounting for the foregone revenue in a concessionary lease for lessors.

BC142. Some respondents suggested more guidance on:

(a) Whether the goals/intent of the parties in entering into a lease contract has weight in the determination of concessionary leases; and

(b) Whether the use of the underlying asset for either its financial or its operational capacity influences the determination of whether the market rates based on the current use or the highest-and-best use is appropriate.

BC143. The IPSASB considered these suggestions and decided not to provide more guidance on the above topics because:

(a) The current guidance in IPSAS 43 and in *Concessionary Leases and Other Arrangements Conveying Rights over Assets* is sufficient to help preparers identify a concessionary lease based on the definition of a lease and its market terms; and

(b) The requirements in *Concessionary Leases and Other Arrangements Conveying Rights over Assets* apply a measurement technique specifically developed for concessionary leases, where the requirement of “based on the current use” is provided as a cost-relief to preparers.

BC144. However, the IPSASB decided to add illustrative examples on other lease-type arrangements that are common in the public sector to help preparers identifying a lease.

Lessee

Recognition and Measurement

BC145. IPSAS 43 initially measures the right-of-use assets at cost. This is consistent with the measurement of many other non-financial assets, such as assets within the scope of IPSAS 12, *Inventories*, IPSAS 16, IPSAS 31, *Intangible Assets*, and IPSAS 45 that are a result of exchange transactions. However, for non-exchange transactions a cost measurement basis does not reflect the economics of the transaction because it does not capture the embedded concession.

BC146. To address this issue, when developing the guidance to account for the right-of-use asset and the concession component in concessionary leases in ED 84 and ED 88, the IPSASB considered the principles in the IPSAS mentioned in paragraph BC143, as well as in IPSAS 23, IPSAS 41, *Financial Instruments*, and IPSAS 47.

BC147. The IPSASB noted that the above IPSAS require that assets acquired through non-exchange transactions be measured at their fair value as at the date of acquisition. The IPSASB considered also requiring measuring the right-of-use asset at fair value in a concessionary lease because:

(a) It is consistent with IPSASB’s literature on the accounting for non-exchange transactions, including concessionary loans;

(b) It provides information on operating and financial capacity as referred in the Conceptual Framework for accountability and decision-making purposes; and

(c) Recognizing the implicit concession in a lease at below-market terms would enhance Public Financial Management (PFM) to the extent that the improvements would outweigh the costs associated with such a change for accountability and decision-making purposes.

BC148. However, the IPSASB noted that when an entity values the right-of-use asset at fair value it should measure the right to use the underlying asset, not the underlying asset itself, which is reflected in the payments for the lease at market rates. Therefore, the IPSASB decided to propose measuring the right-of-use asset in a concessionary lease at the present value of payments for the lease at market rates based on the current use of the underlying asset because:

(a) It is a measurement technique consistent with the fair value measurement basis;

(b) It helps preparers in measuring the right-of-use asset using a measurement technique that already exists in IPSAS 43 when dealing with leases that are not at market rates; and

(c) When comparing them with the present value of the contractual payments, preparers can measure the embedded concession.

BC149. The IPSASB also noted that IPSAS 46, *Measurement* introduced a new fair value definition drawn from IFRS 13 *Fair Value Measurement*. The IPSASB also noted that the new fair value definition is associated with the definition of highest and best use.

BC150. The IPSASB decided to refer to the present value of payments for the lease at market rates based on the current use, instead of the highest and best use as implied in the new fair value definition. The IPSASB considered the new fair value definition would not be appropriate because:

(a) The measurement of the right-of-use asset would no longer be based on the current use of the underlying asset, once the current fair value definition is replaced;

(b) There would be increased difficulty in measuring the right-of-use asset as it would be based on other possible uses of the asset to achieve the highest and best use; and

(c) Quite often there is not an active market for right-of-use assets to obtain the highest and best use.

BC151. In reaching this decision, the IPSASB noted that measuring a right-of-use asset at the present value of the lease payments at market rates based on the current use of the underlying asset is determined by considering right-of-use assets that have similar economic benefits or service potential.

BC152. As an exception to the above principle, the IPSASB decided to require measuring the right-of-use asset under a concessionary lease using the contractual payments if the payments for the lease at market rates based on the current use of the underlying asset are not readily available, in order to address the increased difficulty in measuring right-of-use assets in the public sector because of its nature and/or current use (for example, specialized assets). The IPSASB noted that the lease liability would still be reliably measured using the contractual payments for the lease.

BC153. When initially measuring the right-of-use asset in a concessionary lease, the IPSASB expects preparers to apply a reasonable level of effort in determining the present value of lease payments at market rates based on the current use of the underlying asset.

BC154. The IPSASB also decided to account for the concession component in a concessionary lease following the principles applicable to concessionary loans in IPSAS 23[16] because:

[16] The IPSASB carried over this decision to ED 88 with proposals for IPSAS 47, which are broadly consistent with the principles in IPSAS 23.

(a) Both transactions:

(i) Are at below-market terms at inception;

(ii) Have a concession to the price of the resource being transferred; and

(iii) Have the objective to provide/receive resources with a price at below-market terms;

(b) Transferring a resource in cash or in-kind should not modify the accounting for the concession component as revenue in both transactions, as concessionary leases are in substance financing transactions; and

(c) It prevents preparers choosing between concessionary leases and concessionary loans to achieve desired accounting outcomes.

Responses to ED 84, Concessionary Leases and Right-of-Use Assets In-kind

Overview

BC155. The majority of respondents to ED 84 supported the proposed guidance on recognition and measurement for concessionary leases for lessees.

BC156. Some respondents disagreed with ED 84 proposals because:

(a) There is a lack of consistency between lessee and lessor accounting;

(b) They are of the view that concessionary leases are:

(i) Not viewed as financing transactions, rather a means to achieve particular objectives or providing social services; and

(ii) Analogous to services in-kind and service concession arrangements.

BC157. The IPSASB considered these views and decided to proceed with ED 84 proposals because:

(a) The lack of consistency between lessee and lessor accounting impacts all leases, and not only concessionary leases. The IPSASB reaffirmed that it is not within the scope of *Concessionary Leases and Other Arrangements Conveying Rights over Assets* to change the accounting models in IPSAS 43.

(b) Both concessionary leases and concessionary loans can be a way to achieve particular objectives, and therefore it is not a specific feature of concessionary leases. The objectives under which concessionary leases are received or granted have no impact on the classification of the transaction as a lease. This means that, provided that the transaction meets the definition of a lease, the principles proposed in ED 84 are appropriate. Concessionary leases are still financing transactions where there is a significant obligation to pay for the acquisition of the right-of-use asset albeit at below-market terms.

(c) Leases from the lessee perspective under the right-of-use model are not analogous to:

(i) Services because in a lease the resource-recipient (lessee) controls the use of the identified asset, while in a service the resource-provider (supplier) controls the use of the asset. Right-of-use assets are analogous to owned assets by owners where the resource-recipient (lessee) controls the use of the asset (the right-of-use asset in a lease).

(ii) Service concession arrangements because in a lease the resource-recipient (lessee) controls the use of the identified asset:

1. While in a service concession arrangement the resource-provider (grantor) controls the use of the identified asset; and

2. To provide services not on behalf of the resource-provider (lessor), whereas in a service concession arrangement the resource-recipient (operator) has a right to access to operate the underlying asset to provide public service on behalf of the resource-provider (grantor).

Option Between Cost and Fair Value

BC158. Some respondents suggested providing an option between cost and fair value to avoid undue cost or effort and others suggested no recognition and measurement of concessionary leases at market rates for cost-benefit reasons.

BC159. The IPSASB considered these suggestions and decided to proceed with ED 84 proposal because:

(a) It is consistent with *The Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities*, which states that the transaction price of an asset acquired in a non-exchange transaction does not provide information on operational or financial capacity that meets the qualitative characteristics while taking into account the constraints on information on financial reports;

(b) It is consistent with IPSAS as no IPSAS provides an accounting policy option to initially measure at cost or at fair value assets acquired through a non-exchange transaction;

(c) It is conceptually inconsistent to require measurement at fair value of an underlying asset acquired through a non-exchange transaction, but provide an accounting policy option to measure at cost or at fair value the right to use the very same underlying asset;

(d) Should the cost to obtain the market value of lease payments exceed the benefit, the proposals do not require an entity to recognize the right-of-use asset in a concessionary lease measured at market rates and instead should consider the contractual payments; and

(e) The benefits of providing information about the subsidy embedded in a concessionary lease outweigh the cost as long as the preparer does not incur unreasonable efforts and costs to obtain it.

Disclosures Instead of Recognition and Measurement

BC160. Some respondents suggested that disclosures are enough, and that no recognition and measurement requirements are needed.

BC161. The IPSASB considered this suggestion and decided to proceed with ED 84 proposals because according to IPSASB's Conceptual Framework, disclosure is not a substitute for display.

Measurement at Inception or at Commencement Date

BC162. A respondent suggested measuring the right-of-use asset at the inception date, instead of at the commencement date to prevent reassessing all leases for a second time.

BC163. The IPSASB considered this suggestion and decided to proceed with ED 84 proposals because:

(a) A lessee does not obtain and control its right to use the underlying asset until the commencement date;

(b) Any changes to a lease that occur after the inception date and before the commencement date are taken into account when initially measuring the right-of-use asset and lease liability at the commencement date; and

(c) It is more consistent with the measurement date for other transactions, such as the acquisition of property, plant, and equipment.

BC164. In order to prevent preparers from reassessing for a second time whether the transaction is at market terms or at below-market terms at the commencement date, the IPSASB clarified in *Concessionary Leases and Other Arrangements Conveying Rights over Assets* that the assessment is made at inception of the transaction and the measurement is made at the commencement date.

Application of IPSAS 46 Measurement Bases

BC165. Some respondents suggested that the right-of-use asset should be initially measured applying a measurement basis presented in IPSAS 46 (current operational value and fair value), depending on whether the right-of-use asset is held for operational capacity or financial capacity, respectively, or at deemed cost.

BC166. The IPSASB noted that the ED 84 proposal to measure the right-of-use asset is comprised of a measurement technique specifically developed for concessionary leases and is divided into four parts:

(a) Part 1: "present value of payments for the lease"—This requirement applies the concept of the time value of money embedded in the lease because leases normally require a series of payments in the future, even if they are at below-market terms. The measurement technique "present value" is consistent with:

(i) Its applicability in IPSAS 43 for leases at market terms; and

(ii) The accounting principles in IPSAS 46, which measure the current value of assets and liabilities whether the cash flows occur at a point in time or in the future.

(b) Part 2: "at market rates"—This requirement obtains the market lease payments as if the lease was made at market terms. The term "market rates" can be seen as a way of estimating how much the lessee would have to pay for the lease if it was made at market rates.

(c) Part 3: "based on the current use of the underlying asset"—This requirement is a restriction in the assessment of market rates that serves as a cost-relief to preparers, as preparers do not need to search for the highest and best use of the underlying asset.

(d) Part 4: "as at the commencement date"—This requirement is consistent with the requirements in IPSAS 43 for leases at market terms and other items of property, plant, and equipment under IPSAS 45 (see paragraphs BC162–BC163).

BC167. The IPSASB reiterated its reasoning during the development of IPSAS 46 that this Standard is not meant to determine measurement guidance in other IPSAS. The objective of IPSAS 46 is to focus on the definition of appropriate measurement bases and their derivation. IPSAS 46 does not establish requirements for which measurement bases should be used in IPSAS.

BC168. The IPSASB concluded that the proposed measurement principles in ED 84 for right-of-use assets in concessionary leases for lessees are conceptually consistent with the measurement principles in IPSAS. Therefore, the IPSASB decided to carry over these principles to *Concessionary Leases and Other Arrangements Conveying Rights over Assets*.

Terminology

BC169. Several respondents suggested:

(a) Adding more guidance on reasonable level of effort in determining the present value of lease payments at market rates based on the current use of the underlying asset as at the commencement date of the concessionary lease;

(b) Replacing the wording "not readily available" with "impracticable" in context of measuring the market lease payments; and

(c) Adding more guidance on "market rates".

BC170. The IPSASB decided to carry over the ED 84 proposals to *Concessionary Leases and Other Arrangements Conveying Rights over Assets* for consistency with IPSAS 43 because:

(a) The term "reasonable level of effort" is dependent on the context in which it is applied as:

(i) Paragraph AG15(a) of IPSAS 43 already uses the term "reasonable" in the context of identifying substantive substitution rights; and

(ii) The term "reasonable" is a commonly used term in IPSAS without having additional guidance to explain it.

(b) The wording "readily available" is already used in IPSAS 43 without the wording "reasonable level of effort";

(c) The wording "impracticable":

(i) Sets a higher bar of effort to apply the exception, thus leading to more costs in applying the ED 84 proposals than what was intended by the IPSASB;

(ii) Creates an internal inconsistency in IPSAS 43 (i.e., separating components of a contract (see paragraph 15 of IPSAS 43), initial measurement of the lease liability (see paragraph 27 of IPSAS 43); reassessment of the lease liability (see paragraph 42 of IPSAS 43), and sale and leaseback transactions (see paragraph 101 of IPSAS 43)) for similar situations;

(iii) Is used normally in the context of retrospective application of accounting policies or retrospective restatements to correct an error under IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*; and

BC171. The Measurement-Application Phase project will clarify through proposed amendments to IPSAS 46 that market rates do not include concessions.

Reassessment of the Lease Liability

BC172. The IPSASB decided to provide a relief to preparers for the reassessment of the lease liability in concessionary leases by requiring entities to apply the original discount rate when reassessing the lease liability.

Responses to ED 84, Concessionary Leases and Right-of-Use Assets In-kind

BC173. A respondent suggested that the IPSASB consider the updated discount rate for a lease modification because the lessee may always apply the lessee's incremental borrowing rate in case of not knowing the revised interest rate implicit in the lease.

BC174. The IPSASB agreed with the respondent and decided not to modify the IPSAS 43 requirements related to reassessment of the lease liability in case of concessionary leases.

Recognition Exemptions

BC175. The IPSASB considered the applicability to lessees of the general model to account for concessionary leases that are short-term leases and leases for which the underlying asset is of low value.

BC176. The IPSASB decided not to require the general model to lessees' recognition exemptions because:

(a) Leases for which the underlying asset is of low value are not material enough to warrant specific concessionary lease accounting; and

(b) Short-term leases have a lease term of 12 months or less.

Disclosures

BC177. The IPSASB noted that IPSAS 43 already requires disclosures for leases at market terms. Therefore, the IPSASB decided to require additional disclosures that are specific to concessionary leases and related to the accounting model.

Responses to ED 84, *Concessionary Leases and Right-of-Use Assets In-kind*

BC178. Some respondents made several detailed suggestions related to disclosures, such as:

(a) To require disclosures of right-of-use assets by class of underlying asset;

(b) Duplicate in IPSAS 23 the disclosures that exist in IPSAS 43; and

(c) Require disclosures on lessee's dependency on the underlying asset.

BC179. The IPSASB agreed to require disclosures of right-of-use assets by class of underlying asset because it is consistent with IPSAS 43 for leases at market terms. However, the IPSASB decided not to duplicate disclosures for cost-benefit reasons and not to require disclosure on a lessee's dependency on the underlying asset because this topic impacts all leases and not only concessionary leases.

Lessor

Recognition and Measurement

BC180. IPSAS 43 requires lessors to classify leases as either an operating lease or a finance lease under a risks and rewards dual model. Operating leases are viewed as a service, and the net investment in finance leases is viewed as a financial instrument.

BC181. In a finance lease, the substance or main issue of the lease is the underlying asset being transferred with the attached financing (net investment in the lease). The accounting for the transfer of the underlying asset is made in accordance with IPSAS 16, IPSAS 31, and IPSAS 45 as appropriate. The accounting for the attached financing (net investment in the lease) is made in accordance with IPSAS 43, which includes the accounting for the lease payments and the residual value.

BC182. In an operating lease, the substance or main issue of the lease is the stream of cash flows received by the lessor in the form of lease payments, as the lessor continues to recognize the underlying asset.

BC183. As a consequence of the different economics of leases under the risks and rewards dual model, in a:

(a) Concessionary finance lease, the concession is related to the price of the underlying asset transferred to the lessee; and

(b) Concessionary operating lease, the concession component is related to the price of lease payments received from the lessee.

BC184. This means that lessors can have two types of concessionary leases:

(a) Concessionary finance leases-which can be analogous to transferring a non-cash asset (the underlying asset) at below-market terms attached with financing for a portion of the value of the asset transferred (the net investment in the lease); and

(b) Concessionary operating leases-which can be analogous to providing services at below-market terms, as the lessor continues to recognize the underlying asset and the accounting is similar by applying the principles in IPSAS 45 to the accounting of the underlying asset and IPSAS 47 to the accounting of the revenue.

BC185. For concessionary finance leases, the IPSASB decided to continue measuring the transfer of the underlying asset to the lessee at its carrying amount because it is:

(a) The cost of the concession incurred by the lessor, being the economic benefits or service potential given up measured by the carrying amount of the underlying asset; and

(b) Consistent with the derecognition principles in IPSAS 16, IPSAS 31, and IPSAS 45 for disposals.

BC186. For concessionary operating leases, the IPSASB decided to continue measuring the lease payments received by the lessor in accordance with IPSAS 43 because:

(a) No economic benefits or service potential associated with the transaction will flow to the lessor higher than the cash received by the lessor in the form of lease payments made by the lessee; and

(b) It is consistent with revenue recognition principles in IPSAS 23[17].

BC187. In reaching this decision, the IPSASB noted that the terms and conditions of the concessionary operating lease might help an entity assess whether there is an indication that the underlying asset may be impaired in accordance with IPSAS 21, *Impairment of Non-Cash-Generating Assets* or IPSAS 26, *Impairment of Cash-Generating Assets*, as appropriate.

BC188. Following a cost measurement basis for concessionary leases, the IPSASB noted that lessors recognize the loss related with the derecognition of the underlying asset in a concessionary finance lease in accordance with the applicable IPSAS. This means that the cost of the concession would be the difference between the value of the carrying amount of the underlying asset derecognized and the value of the recognition of the net investment in the lease.

BC189. For concessionary operating leases, the IPSASB noted that lessors continue recognizing as revenue the cash received in the form of lease payments made by lessees and there would be no separate recognition of the concession. This situation occurs because the concession is related to the foregone revenue related to the lease payments. As foregone revenue is not recognized under IPSAS 9[18], the IPSASB did not identify an economic reason to provide an exception to this principle in the context of concessionary operating leases.

BC190. The IPSASB concluded that the cost of the concession will be the difference between the:

(a) Depreciation of the underlying asset, other expenses related to the underlying asset, and the impairment charge related to the underlying asset, if any; and

(b) Revenue obtained in the lease payments received from the lessee.

Responses to ED 84, Concessionary Leases and Right-of-Use Assets In-kind

BC191. The majority of respondents to ED 84 supported the ED 84 proposals on recognition and measurement for concessionary leases for lessors.

BC192. Some respondents disagreed with ED 84 proposals because:

(a) ED 84 appears to treat the leasing standard as somehow appropriate for use by lessors in a finance lease providing concessionary leases when there is no stream of cash flows;

(b) Consideration of impairment in a concessionary operating lease should not be contemplated;

(c) In a concessionary finance lease, the underlying asset should not be derecognized if it continues to embody service potential; and

(d) Inconsistency between concessionary operating leases and concessionary finance leases where there is a loss on commencement date of the concessionary finance lease and no loss arises on commencement date of the concessionary operating lease, while both can have service delivery or outcome objectives.

BC193. The IPSASB considered these views and decided to proceed with ED 84 proposals because:

---

[17] The IPSASB carried over this decision to ED 88 with proposals for IPSAS 47, which are broadly consistent with the principles in IPSAS 23.

[18] The IPSASB carried over this decision to ED 88 with proposals for IPSAS 47, which are broadly consistent with the principles in IPSAS 9 on this topic.

(a) The main issue in a concessionary finance lease is the underlying asset being transferred at below market terms. In this type of lease, the cost of the concession is the difference between the carrying amount of the underlying asset being transferred and the net investment in the lease. The accounting for the lease component is within the scope of IPSAS 43, and the accounting for the derecognition of the underlying asset is in accordance with IPSAS 16, IPSAS 31, and IPSAS 45, as appropriate.

(b) The IPSASB did not change the requirements for impairment in IPSAS 26, as the principles in that Standard are still applicable assessing impairment of the underlying asset in concessionary operating leases.

(c) The derecognition criteria and the accounting are in scope of IPSAS 16, IPSAS 31, and IPSAS 45, as appropriate, not in scope of IPSAS 43. IPSAS 43 provides several indicators of a finance lease that need to be taken into consideration in a holistic way. *Concessionary Leases and Other Arrangements Conveying Rights over Assets* does not amend the derecognition criteria and the accounting in other IPSAS nor the indicators of a finance leases in IPSAS 43, as these are related to all finance leases, not only concessionary finance leases.

Disclosures

BC194. Similar to lessees, the IPSASB noted that IPSAS 43 already requires disclosures for leases at market terms for lessors. Therefore, the IPSASB decided to require additional disclosures that are specific to concessionary leases for both concessionary finance leases and concessionary operating leases and related to the dual accounting model.

Responses to ED 84, Concessionary Leases and Right-of-Use Assets In-kind

BC195. The majority of respondents to ED 84 supported the ED 84 proposals on disclosures for concessionary leases for lessors.

BC196. Some respondents were of the view that there was a lack of information in the disclosures on foregone revenue and costs associated with the underlying asset in concessionary operating leases.

BC197. The IPSASB considered these views and decided not to require the disclosure of foregone revenue because the disclosures required are related to the accounting model[19]. Additionally, the IPSASB decided to require the disclosure of the costs associated with the underlying asset in concessionary operating leases for transparency reasons.

Sale and Leaseback Transactions

BC198. The IPSASB considered whether to amend the requirements in IPSAS 43 on sale and leaseback transactions at below-market terms to be consistent with the requirements of concessionary leases.

BC199. The IPSASB noted that, in principle, from a conceptual perspective, concessionary leases and leasebacks at below-market terms have two key differences:

(a) Different starting points—A leaseback at below-market terms is linked to a previous sale with the same party as interdependent transactions, while a concessionary lease is not linked to a previous sale with the same party; and

(b) Different objectives—A sale and leaseback transaction has the objective of obtaining cash through the sale of the underlying asset and refunding the cash proceeds in the form of lease payments, while a

[19] The IPSASB carried over this decision to ED 88 with proposals for IPSAS 47, which are broadly consistent with the principles in IPSAS 9 on this topic.

concessionary lease has the objective of conveying a concession through the right to use an underlying asset at below-market terms.

BC200. However, leasebacks at below-market terms might exist in the public sector with an identifiable concession embedded because there is no actual prepayment of the leaseback, as the agreed purchase price of the underlying asset is the same as its fair value.

BC201. The IPSASB noted that this may be a public sector-specific situation because normally in the private sector both the sale and leaseback are either at above-market terms or at below-market terms, not the leaseback alone being at below-market terms.

BC202. Therefore, the IPSASB decided to amend IPSAS 43 requirements on sale and leaseback transactions to address the situation where the below-market terms of the leaseback are not linked to a prepayment.

Transition

BC203. The IPSASB considered the transition requirements for concessionary leases. The IPSASB decided to propose transition requirements on concessionary leases similar to leases at market terms, where applicable, in order not to require extra efforts by preparers in applying the new proposed guidance on concessionary leases.

BC204. The IPSASB encourages preparers to apply IPSAS 3, Accounting Policies, Changes in Accounting Estimates and Errors on transition because of the prevalence in the public sector of concessionary leases with long contract terms.

Responses to ED 84, *Concessionary Leases and Right-of-Use Assets In-kind*

BC205. Several respondents suggested easing the transition requirements for lessees by requiring measurement of the right-of-use asset at the present value of the remaining payments for the lease at market rates based on the current use of the underlying asset and discounted using the lessee's incremental borrowing rate at the date of initial application.

BC206. The IPSASB agreed with this suggestion for cost-benefit reasons.

Effective Date

BC207. The IPSASB considered the effective date of the amendments to IPSAS 43 in the context of effective dates of IPSAS 43 to IPSAS 49.

BC208. The IPSASB decided that the effective date of the amendments to IPSAS 43 should be January 1, 2027, with earlier application permitted, because it:

(a) Is broadly consistent with the three-year application period of IPSAS 43;

(b) Does not overwhelm preparers with more changes to be effective at the same time as IPSAS 43 to IPSAS 49; and

(c) Allows preparers an additional year for planning and implementation of the amendments to IPSAS 43 and IPSAS 47 after implementing IPSAS 43 to IPSAS 49 in the previous years.

BC209. The IPSASB also considered postponing the effective date of IPSAS 43 for two years to align with the effective date of the amendments to IPSAS 43 and decided not to do so because:

(a) It is more important to require the application of the new principles in IPSAS 43 sooner rather than later; and

(b) Entities always have the possibility of early adopting the new requirements in *Concessionary Leases and Other Arrangements Conveying Rights over Assets* to a subset of lease transactions in the context of early adopting IPSAS 43 to align the effective dates.

Revisions of IPSAS 43 as a result of Amendments to IPSAS Standards: Specific IFRIC Interpretations

BC210. In September 2023, the IPSASB initiated a narrow scope project to consider seven IFRIC and SIC Interpretations that were issued by the IFRS Interpretations Committee, but had not yet been considered by the IPSASB, to determine their applicability to the public sector. In its assessment, the IPSASB considered whether public sector entities may face similar application issues, and whether incorporating guidance based on the Interpretations into IPSAS would help clarify the application of existing accounting principles.

BC211. The IPSASB reviewed the requirements of IFRIC 1 *Changes in Existing Decommissioning, Restoration and Similar Liabilities*, first issued by the IASB in 2004, and the IFRS Interpretations Committee's considerations in reaching its consensus as set out in its Basis for Conclusions. The IPSASB generally concurred that there was no public sector specific reason for not incorporating these requirements into IPSAS 19, Provisions, Contingent Liabilities and Contingent Assets.

BC212. In April 2024, the IPSASB published Exposure Draft (ED) 89, *Amendments to Consider IFRIC Interpretations*, which proposed to add guidance to IPSAS 43 to direct users to relevant guidance in IPSAS 19. The IPSASB received strong constituent support for these proposals. Therefore, it decided to amend IPSAS 43 to incorporate the proposed guidance.

Implementation Guidance

This guidance accompanies, but is not part of, IPSAS 43.

IG1. The purpose of this Implementation Guidance is to illustrate certain aspects of the requirements of IPSAS 43.

Difference between services, service concession arrangements, and leases

IG2. The diagram below summarizes some differences between a service, a service concession arrangement and a lease and the respective guidance in IPSAS.

Classification / Type of control	Service	Service concession arrangement	Lease
Control of an identified asset	Supplier: Yes Customer: No	Grantor: Yes Operator: No	Lessor: • Finance Lease: No • Operating Lease: Yes Lessee: No
Control of the right to use an identified asset	Supplier: Yes Customer: No	Grantor: Yes Operator: No	Lessor: No Lessee: Yes
Control of the right to access to operate an identified asset	Supplier: Yes Customer: No	Grantor: No Operator: Yes	Lessor: No Lessee: Yes

Illustrative Examples

These examples accompany, but are not part of, IPSAS 43.

IE1. These examples portray hypothetical situations illustrating how an entity might apply some of the requirements in IPSAS 43 to particular aspects of a lease (or other contracts) on the basis of the limited facts presented. The analysis in each example is not intended to represent the only manner in which the requirements could be applied, nor are the examples intended to apply only to the specific industry illustrated. Although some aspects of the examples may be present in actual fact patterns, all relevant facts and circumstances of a particular fact pattern would need to be evaluated when applying IPSAS 43.

Identifying a Lease (see paragraphs 10–12 and AG10–AG31)

IE2. The following examples illustrate how an entity determines whether a contract is, or contains, a lease.

Example 1–Rail Cars

Example 1A: a contract between Customer and a freight carrier (Supplier) provides Customer with the use of 10 rail cars of a particular type for five years. The contract specifies the rail cars; the cars are owned by Supplier. Customer determines when, where and which goods are to be transported using the cars. When the cars are not in use, they are kept at Customer's premises. Customer can use the cars for another purpose (for example, storage) if it so chooses. However, the contract specifies that Customer cannot transport particular types of cargo (for example, explosives). If a particular car needs to be serviced or repaired, Supplier is required to substitute a car of the same type. Otherwise, and other than on default by Customer, Supplier cannot retrieve the cars during the five-year period.

The contract also requires Supplier to provide an engine and a driver when requested by Customer. Supplier keeps the engines at its premises and provides instructions to the driver detailing Customer's requests to transport goods. Supplier can choose to use any one of a number of engines to fulfil each of Customer's requests, and one engine could be used to transport not only Customer's goods, but also the goods of other customers (i.e., if other customers require the transportation of goods to destinations close to the destination requested by Customer and within a similar timeframe, Supplier can choose to attach up to 100 rail cars to the engine).

The contract contains leases of rail cars. Customer has the right to use 10 rail cars for five years.

There are 10 identified cars. The cars are explicitly specified in the contract. Once delivered to Customer, the cars can be substituted only when they need to be serviced or repaired (see paragraph AG19). The engine used to transport the rail cars is not an identified asset because it is neither explicitly specified nor implicitly specified in the contract.

Customer has the right to control the use of the 10 rail cars throughout the five-year period of use because:

(a) Customer has the right to obtain substantially all of the economic benefits or service potential from use of the cars over the five-year period of use. Customer has exclusive use of the cars throughout the period of use, including when they are not being used to transport Customer's goods.

(b) Customer has the right to direct the use of the cars because the conditions in paragraph AG25(a) exist. The contractual restrictions on the cargo that can be transported by the cars are protective rights of Supplier and define the scope of Customer's right to use the cars. Within the scope of its right of use defined in the contract, Customer makes the relevant decisions about how and for what purpose the cars are used by being able to decide when and where the rail cars will be used and which goods are transported using the cars. Customer also determines whether and how the cars will be used when not

being used to transport its goods (for example, whether and when they will be used for storage). Customer has the right to change these decisions during the five-year period of use.

Although having an engine and driver (controlled by Supplier) to transport the rail cars is essential to the efficient use of the cars, Supplier's decisions in this regard do not give it the right to direct how and for what purpose the rail cars are used. Consequently, Supplier does not control the use of the cars during the period of use.

Example 1B: the contract between Customer and Supplier requires Supplier to transport a specified quantity of goods by using a specified type of rail car in accordance with a stated timetable for a period of five years. The timetable and quantity of goods specified are equivalent to Customer having the use of 10 rail cars for five years. Supplier provides the rail cars, driver and engine as part of the contract. The contract states the nature and quantity of the goods to be transported (and the type of rail car to be used to transport the goods). Supplier has a large pool of similar cars that can be used to fulfil the requirements of the contract. Similarly, Supplier can choose to use any one of a number of engines to fulfil each of Customer's requests, and one engine could be used to transport not only Customer's goods, but also the goods of other customers. The cars and engines are stored at Supplier's premises when not being used to transport goods.

The contract does not contain a lease of rail cars or of an engine.

The rail cars and the engines used to transport Customer's goods are not identified assets. Supplier has the substantive right to substitute the rail cars and engine because:

(a) Supplier has the practical ability to substitute each car and the engine throughout the period of use (see paragraph AG15(a)). Alternative cars and engines are readily available to Supplier and Supplier can substitute each car and the engine without Customer's approval.

(b) Supplier would benefit economically from substituting each car and the engine (see paragraph AG15(b)). There would be minimal, if any, cost associated with substituting each car or the engine because the cars and engines are stored at Supplier's premises and Supplier has a large pool of similar cars and engines. Supplier benefits from substituting each car or the engine in contracts of this nature because substitution allows Supplier to, for example, (i) use cars or an engine to fulfil a task for which the cars or engine are already positioned to perform (for example, a task at a rail yard close to the point of origin) or (ii) use cars or an engine that would otherwise be sitting idle because they are not being used by a customer.

Accordingly, Customer does not direct the use, nor have the right to obtain substantially all of the economic benefits or service potential from use, of an identified car or an engine. Supplier directs the use of the rail cars and engine by selecting which cars and engine are used for each particular delivery and obtains substantially all of the economic benefits from use of the rail cars and engine. Supplier is only providing freight capacity.

Example 2–Allocated Space

A coffee company (Customer) enters into a contract with an airport operator (Supplier) to use a space in the airport to sell its goods for a three-year period. The contract states the amount of space and that the space may be located at any one of several boarding areas within the airport. Supplier has the right to change the location of the space allocated to Customer at any time during the period of use. There are minimal costs to Supplier associated with changing the space for the Customer: Customer uses a kiosk (that it owns) that can be moved easily to sell its goods. There are many areas in the airport that are available and that would meet the specifications for the space in the contract.

The contract does not contain a lease.

Although the amount of space Customer uses is specified in the contract, there is no identified asset. Customer controls its owned kiosk. However, the contract is for space in the airport, and this space can change at the discretion of Supplier. Supplier has the substantive right to substitute the space Customer uses because:

(a) Supplier has the practical ability to change the space used by Customer throughout the period of use (see paragraph AG15(a)). There are many areas in the airport that meet the specifications for the space in the contract, and Supplier has the right to change the location of the space to other space that meets the specifications at any time without Customer's approval.

(b) Supplier would benefit economically from substituting the space (see paragraph AG15(b)). There would be minimal cost associated with changing the space used by Customer because the kiosk can be moved easily. Supplier benefits from substituting the space in the airport because substitution allows Supplier to make the most effective use of the space at boarding areas in the airport to meet changing circumstances.

Example 3–Fiber-Optic Cable

Example 3A: Customer enters into a 15-year contract with a utilities company (Supplier) for the right to use three specified, physically distinct dark fibers within a larger cable connecting Hong Kong to Tokyo. Customer makes the decisions about the use of the fibers by connecting each end of the fibers to its electronic equipment (i.e., Customer 'lights' the fibers and decides what data, and how much data, those fibers will transport). If the fibers are damaged, Supplier is responsible for the repairs and maintenance. Supplier owns extra fibers, but can substitute those for Customer's fibers only for reasons of repairs, maintenance or malfunction (and is obliged to substitute the fibers in these cases).

The contract contains a lease of dark fibers. Customer has the right to use the three dark fibers for 15 years.

There are three identified fibers. The fibers are explicitly specified in the contract and are physically distinct from other fibers within the cable. Supplier cannot substitute the fibers other than for reasons of repairs, maintenance or malfunction (see paragraph AG19).

Customer has the right to control the use of the fibers throughout the 15-year period of use because:

(a) Customer has the right to obtain substantially all of the economic benefits or service potential from use of the fibers over the 15-year period of use. Customer has exclusive use of the fibers throughout the period of use.

(b) Customer has the right to direct the use of the fibers because the conditions in paragraph AG25(a) exist. Customer makes the relevant decisions about how and for what purpose the fibers are used by deciding (i) when and whether to light the fibers and (ii) when and how much output the fibers will produce (i.e., what data, and how much data, those fibers will transport). Customer has the right to change these decisions during the 15-year period of use.

Although Supplier's decisions about repairing and maintaining the fibers are essential to their efficient use, those decisions do not give Supplier the right to direct how and for what purpose the fibers are used. Consequently, Supplier does not control the use of the fibers during the period of use.

Example 3B: Customer enters into a 15-year contract with Supplier for the right to use a specified amount of capacity within a cable connecting Hong Kong to Tokyo. The specified amount is equivalent to Customer having the use of the full capacity of three fiber strands within the cable (the cable contains 15 fibers with similar capacities). Supplier makes decisions about the transmission of data (i.e., Supplier lights the fibers, makes decisions about which fibers are used to transmit Customer's traffic and makes decisions about the electronic equipment that Supplier owns and connects to the fibers).

The contract does not contain a lease.

Supplier makes all decisions about the transmission of its customers' data, which requires the use of only a portion of the capacity of the cable for each customer. The capacity portion that will be provided to Customer is not physically distinct from the remaining capacity of the cable and does not represent substantially all of the capacity of the cable (see paragraph AG21). Consequently, Customer does not have the right to use an identified asset.

Example 4–Office Unit

Customer enters into a contract with a property owner (Supplier) to use Office Unit A for a five-year period. Office Unit A is part of a larger office space with many office units.

Customer is granted the right to use Office Unit A. Supplier can require Customer to relocate to another office unit. In that case, Supplier is required to provide Customer with an office unit of similar quality and specifications to Office Unit A and to pay for Customer's relocation costs. Supplier would benefit economically from relocating Customer only if a major new tenant were to decide to occupy a large amount of office space at a rate sufficiently favorable to cover the costs of relocating Customer and other tenants in the office space. However, although it is possible that those circumstances will arise, at inception of the contract, it is not likely that those circumstances will arise.

The contract requires Customer to use Office Unit A to operate its well-known tourist office to sell or provide its services during the hours that the larger office space is open. Customer makes all of the decisions about the use of the office unit during the period of use. For example, Customer decides on the mix of services sold or provided from the unit, the pricing of the services sold or provided and the number of employees working. Customer also controls physical access to the unit throughout the five-year period of use.

The contract requires Customer to make fixed payments to Supplier, as well as variable payments that are a percentage of services sold or provided from Office Unit A.

Supplier provides cleaning and security services as part of the contract.

The contract contains a lease of office space. Customer has the right to use Office Unit A for five years.

Office Unit A is an identified asset. It is explicitly specified in the contract. Supplier has the practical ability to substitute the office unit, but could benefit economically from substitution only in specific circumstances. Supplier's substitution right is not substantive because, at inception of the contract, those circumstances are not considered likely to arise (see paragraph AG17).

Customer has the right to control the use of Office Unit A throughout the five-year period of use because:

(a) Customer has the right to obtain substantially all of the economic benefits or service potential from use of Office Unit A over the five-year period of use. Customer has exclusive use of Office Unit A throughout the period of use. Although a portion of the cash flows derived from services sold or provided from Office Unit A will flow from Customer to Supplier, this represents consideration that Customer pays Supplier for the right to use the office unit. It does not prevent Customer from having the right to obtain substantially all of the economic benefits or service potential from use of Office Unit A.

(b) Customer has the right to direct the use of Office Unit A because the conditions in paragraph AG25(a) exist. The contractual restrictions on the services that can be provided or sold from Office Unit A, and when Office Unit A is open, define the scope of Customer's right to use Office Unit A. Within the scope of its right of use defined in the contract, Customer makes the relevant decisions about how and for what purpose Office Unit A is used by being able to decide, for example, the mix of services that will be provided from or sold in the office unit and the sale price for those services. Customer has the right to change these decisions during the five-year period of use.

Although cleaning, security, and advertising services are essential to the efficient use of Office Unit A, Supplier's decisions in this regard do not give it the right to direct how and for what purpose Office Unit A is used. Consequently, Supplier does not control the use of Office Unit A during the period of use and Supplier's decisions do not affect Customer's control of the use of Office Unit A.

Example 5–Truck Rental

Customer enters into a contract with Supplier for the use of a truck for one week to transport cargo from New York to San Francisco. Supplier does not have substitution rights. Only cargo specified in the contract is permitted to be transported on this truck for the period of the contract. The contract specifies a maximum distance that the truck can be driven. Customer is able to choose the details of the journey (speed, route, rest stops, etc.) within the parameters of the contract. Customer does not have the right to continue using the truck after the specified trip is complete.

The cargo to be transported, and the timing and location of pick-up in New York and delivery in San Francisco, are specified in the contract.

Customer is responsible for driving the truck from New York to San Francisco.

The contract contains a lease of a truck. Customer has the right to use the truck for the duration of the specified trip.

There is an identified asset. The truck is explicitly specified in the contract, and Supplier does not have the right to substitute the truck.

Customer has the right to control the use of the truck throughout the period of use because:

(a) Customer has the right to obtain substantially all of the economic benefits or service potential from use of the truck over the period of use. Customer has exclusive use of the truck throughout the period of use.

(b) Customer has the right to direct the use of the truck because the conditions in AG25(b)(i) exist. How and for what purpose the truck will be used (i.e., the transportation of specified cargo from New York to San Francisco within a specified timeframe) is predetermined in the contract. Customer directs the use of the truck because it has the right to operate the truck (for example, speed, route, rest stops) throughout the period of use. Customer makes all of the decisions about the use of the truck that can be made during the period of use through its control of the operations of the truck.

Because the duration of the contract is one week, this lease meets the definition of a short-term lease.

Example 6–Ship

Example 6A: Customer enters into a contract with a ship owner (Supplier) for the transportation of cargo from Rotterdam to Sydney on a specified ship. The ship is explicitly specified in the contract and Supplier does not have substitution rights. The cargo will occupy substantially all of the capacity of the ship. The contract specifies the cargo to be transported on the ship and the dates of pickup and delivery.

Supplier operates and maintains the ship and is responsible for the safe passage of the cargo on board the ship. Customer is prohibited from hiring another operator for the ship or operating the ship itself during the term of the contract.

The contract does not contain a lease.

There is an identified asset. The ship is explicitly specified in the contract and Supplier does not have the right to substitute that specified ship.

Customer has the right to obtain substantially all of the economic benefits or service potential from use of the ship over the period of use. Its cargo will occupy substantially all of the capacity of the ship, thereby preventing other parties from obtaining economic benefits or service potential from use of the ship.

However, Customer does not have the right to control the use of the ship because it does not have the right to direct its use. Customer does not have the right to direct how and for what purpose the ship is used. How and for what purpose the ship will be used (i.e., the transportation of specified cargo from Rotterdam to Sydney within a specified timeframe) is predetermined in the contract. Customer has no right to change how and for what purpose the ship is used during the period of use. Customer has no other decision-making rights about the use of the ship during the period of use (for example, it does not have the right to operate the ship) and did not design the ship. Customer has the same rights regarding the use of the ship as if it were one of many customers transporting cargo on the ship.

Example 6B: Customer enters into a contract with Supplier for the use of a specified ship for a five-year period. The ship is explicitly specified in the contract and Supplier does not have substitution rights.

Customer decides what cargo will be transported, and whether, when and to which ports the ship will sail, throughout the five-year period of use, subject to restrictions specified in the contract. Those restrictions prevent Customer from sailing the ship into waters at a high risk of piracy or carrying hazardous materials as cargo.

Supplier operates and maintains the ship and is responsible for the safe passage of the cargo on board the ship. Customer is prohibited from hiring another operator for the ship of the contract or operating the ship itself during the term of the contract.

The contract contains a lease. Customer has the right to use the ship for five years.

There is an identified asset. The ship is explicitly specified in the contract, and Supplier does not have the right to substitute that specified ship.

Customer has the right to control the use of the ship throughout the five-year period of use because:

(a) Customer has the right to obtain substantially all of the economic benefits or service potential from use of the ship over the five-year period of use. Customer has exclusive use of the ship throughout the period of use.

(b) Customer has the right to direct the use of the ship because the conditions in paragraph AG25(a) exist. The contractual restrictions about where the ship can sail and the cargo to be transported by the ship define the scope of Customer's right to use the ship. They are protective rights that protect Supplier's investment in the ship and Supplier's personnel. Within the scope of its right of use, Customer makes the relevant decisions about how and for what purpose the ship is used throughout the five-year period of use because it decides whether, where and when the ship sails, as well as the cargo it will transport. Customer has the right to change these decisions throughout the five-year period of use.

Although the operation and maintenance of the ship are essential to its efficient use, Supplier's decisions in this regard do not give it the right to direct how and for what purpose the ship is used. Instead, Supplier's decisions are dependent upon Customer's decisions about how and for what purpose the ship is used.

Example 7–Aircraft

Customer enters into a contract with an aircraft owner (Supplier) for the use of an explicitly specified aircraft for a two-year period. The contract details the interior and exterior specifications for the aircraft.

There are contractual and legal restrictions in the contract on where the aircraft can fly. Subject to those restrictions, Customer determines where and when the aircraft will fly, and which passengers and cargo will be transported on the aircraft. Supplier is responsible for operating the aircraft, using its own crew. Customer

is prohibited from hiring another operator for the aircraft or operating the aircraft itself during the term of the contract.

Supplier is permitted to substitute the aircraft at any time during the two-year period and must substitute the aircraft if it is not working. Any substitute aircraft must meet the interior and exterior specifications in the contract. There are significant costs involved in outfitting an aircraft in Supplier's fleet to meet Customer's specifications.

The contract contains a lease. Customer has the right to use the aircraft for two years.

There is an identified asset. The aircraft is explicitly specified in the contract and, although Supplier can substitute the aircraft, its substitution right is not substantive because the conditions in paragraph AG15(b) do not exist. Supplier's substitution right is not substantive because of the significant costs involved in outfitting another aircraft to meet the specifications required by the contract such that Supplier is not expected to benefit economically from substituting the aircraft.

Customer has the right to control the use of the aircraft throughout the two-year period of use because:

(a) Customer has the right to obtain substantially all of the economic benefits or service potential from use of the aircraft over the two-year period of use. Customer has exclusive use of the aircraft throughout the period of use.

(b) Customer has the right to direct the use of the aircraft because the conditions in paragraph AG25(a) exist. The restrictions on where the aircraft can fly define the scope of Customer's right to use the aircraft. Within the scope of its right of use, Customer makes the relevant decisions about how and for what purpose the aircraft is used throughout the two-year period of use because it decides whether, where and when the aircraft travels as well as the passengers and cargo it will transport. Customer has the right to change these decisions throughout the two-year period of use.

Although the operation of the aircraft is essential to its efficient use, Supplier's decisions in this regard do not give it the right to direct how and for what purpose the aircraft is used. Consequently, Supplier does not control the use of the aircraft during the period of use and Supplier's decisions do not affect Customer's control of the use of the aircraft.

Example 8–Contract for Shirts

Customer enters into a contract with a producer (Supplier) to purchase a particular type, quality and quantity of shirts for a three-year period. The type, quality and quantity of shirts are specified in the contract.

Supplier has only one factory that can meet the needs of Customer. Supplier is unable to supply the shirts from another factory or source the shirts from a third party supplier. The capacity of the factory exceeds the output for which Customer has contracted (i.e., Customer has not contracted for substantially all of the capacity of the factory).

Supplier makes all decisions about the operations of the factory, including the production level at which to run the factory and which customer contracts to fulfil with the output of the factory that is not used to fulfil Customer's contract.

The contract does not contain a lease.

The factory is an identified asset. The factory is implicitly specified because Supplier can fulfil the contract only through the use of this asset.

Customer does not control the use of the factory because it does not have the right to obtain substantially all of the economic benefits or service potential from use of the factory. This is because Supplier could decide to use the factory to fulfil other customer contracts during the period of use.

Customer also does not control the use of the factory because it does not have the right to direct the use of the factory. Customer does not have the right to direct how and for what purpose the factory is used during the three-year period of use. Customer's rights are limited to specifying output from the factory in the contract with Supplier. Customer has the same rights regarding the use of the factory as other customers purchasing shirts from the factory. Supplier has the right to direct the use of the factory because Supplier can decide how and for what purpose the factory is used (i.e., Supplier has the right to decide the production level at which to run the factory and which customer contracts to fulfil with the output produced.(

Either the fact that Customer does not have the right to obtain substantially all of the economic benefits or service potential from use of the factory, or that Customer does not have the right to direct the use of the factory, would be sufficient in isolation to conclude that Customer does not control the use of the factory.

Example 9–Contract for Energy/Power

Example 9A: a public sector entity (Customer) enters into a contract with a power company (Supplier) to purchase all of the electricity produced by a new solar farm for 20 years. The solar farm is explicitly specified in the contract and Supplier has no substitution rights. The solar farm is owned by Supplier and the energy cannot be provided to Customer from another asset. Customer designed the solar farm before it was constructed—Customer hired experts in solar energy to assist in determining the location of the farm and the engineering of the equipment to be used. Supplier is responsible for building the solar farm to Customer's specifications, and then operating and maintaining it. There are no decisions to be made about whether, when or how much electricity will be produced because the design of the asset has predetermined those decisions. Supplier will receive tax credits relating to the construction and ownership of the solar farm, while Customer receives renewable energy credits that accrue from use of the solar farm.

The contract contains a lease. Customer has the right to use the solar farm for 20 years.

There is an identified asset because the solar farm is explicitly specified in the contract, and Supplier does not have the right to substitute the specified solar farm.

Customer has the right to control the use of the solar farm throughout the 20-year period of use because:

(a) Customer has the right to obtain substantially all of the economic benefits or service potential from use of the solar farm over the 20-year period of use. Customer has exclusive use of the solar farm; it takes all of the electricity produced by the farm over the 20-year period of use as well as the renewable energy credits that are a by-product from use of the solar farm. Although Supplier will receive economic benefits from the solar farm in the form of tax credits, those economic benefits relate to the ownership of the solar farm rather than the use of the solar farm and, thus, are not considered in this assessment.

(b) Customer has the right to direct the use of the solar farm because the conditions in paragraph AG25(b)(ii) exist. Neither Customer, nor Supplier, decides how and for what purpose the solar farm is used during the period of use because those decisions are predetermined by the design of the asset (i.e., the design of the solar farm has, in effect, programmed into the asset any relevant decision-making rights about how and for what purpose the solar farm is used throughout the period of use). Customer does not operate the solar farm; Supplier makes the decisions about the operation of the solar farm. However, Customer's design of the solar farm has given it the right to direct the use of the farm. Because the design of the solar farm has predetermined how and for what purpose the asset will be used throughout the period of use, Customer's control over that design is substantively no different from Customer controlling those decisions.

Example 9B: Customer enters into a contract with Supplier to purchase all of the power produced by an explicitly specified power plant for three years. The power plant is owned and operated by Supplier.

Supplier is unable to provide power to Customer from another plant. The contract sets out the quantity and timing of power that the power plant will produce throughout the period of use, which cannot be changed in the absence of extraordinary circumstances (for example, emergency situations). Supplier operates and maintains the plant on a daily basis in accordance with industry-approved operating practices. Supplier designed the power plant when it was constructed some years before entering into the contract with Customer—Customer had no involvement in that design.

The contract does not contain a lease.

There is an identified asset because the power plant is explicitly specified in the contract, and Supplier does not have the right to substitute the specified plant.

Customer has the right to obtain substantially all of the economic benefits or service potential from use of the identified power plant over the three-year period of use. Customer will take all of the power produced by the power plant over the three-year period of use.

However, Customer does not have the right to control the use of the power plant because it does not have the right to direct its use. Customer does not have the right to direct how and for what purpose the plant is used. How and for what purpose the plant is used (i.e., whether, when and how much power the plant will produce) is predetermined in the contract. Customer has no right to change how and for what purpose the plant is used during the period of use. Customer has no other decision-making rights about the use of the power plant during the period of use (for example, it does not operate the power plant) and did not design the plant. Supplier is the only party that can make decisions about the plant during the period of use by making the decisions about how the plant is operated and maintained. Customer has the same rights regarding the use of the plant as if it were one of many customers obtaining power from the plant.

Example 9C: Customer enters into a contract with Supplier to purchase all of the power produced by an explicitly specified power plant for 10 years. The contract states that Customer has rights to all of the power produced by the plant (i.e., Supplier cannot use the plant to fulfil other contracts).

Customer issues instructions to Supplier about the quantity and timing of the delivery of power. If the plant is not producing power for Customer, it does not operate.

Supplier operates and maintains the plant on a daily basis in accordance with industry-approved operating practices.

The contract contains a lease. Customer has the right to use the power plant for 10 years.

There is an identified asset. The power plant is explicitly specified in the contract and Supplier does not have the right to substitute the specified plant.

Customer has the right to control the use of the power plant throughout the 10-year period of use because:

(a) Customer has the right to obtain substantially all of the economic benefits or service potential from use of the power plant over the 10-year period of use. Customer has exclusive use of the power plant; it has rights to all of the power produced by the power plant throughout the 10-year period of use.

(b) Customer has the right to direct the use of the power plant because the conditions in paragraph AG25(a) exist. Customer makes the relevant decisions about how and for what purpose the power plant is used because it has the right to determine whether, when and how much power the plant will produce (i.e., the timing and quantity, if any, of power produced) throughout the period of use. Because Supplier is prevented from using the power plant for another purpose, Customer’s decision-making

about the timing and quantity of power produced, in effect, determines when, and whether, the plant produces output.

Although the operation and maintenance of the power plant are essential to its efficient use, Supplier's decisions in this regard do not give it the right to direct how and for what purpose the power plant is used. Consequently, Supplier does not control the use of the power plant during the period of use. Instead, Supplier's decisions are dependent upon Customer's decisions about how and for what purpose the power plant is used.

Example 10–Contract for Network Services

Example 10A: Customer enters into a contract with a telecommunications company (Supplier) for network services for two years. The contract requires Supplier to supply network services that meet a specified quality level. In order to provide the services, Supplier installs and configures servers at Customer's premises—Supplier determines the speed and quality of data transportation in the network using the servers. Supplier can reconfigure or replace the servers when needed to continuously provide the quality of network services defined in the contract. Customer does not operate the servers or make any significant decisions about their use.

The contract does not contain a lease. Instead, the contract is a service contract in which Supplier uses the equipment to meet the level of network services determined by Customer.

There is no need to assess whether the servers installed at Customer's premises are identified assets. This assessment would not change the analysis of whether the contract contains a lease because Customer does not have the right to control the use of the servers.

Customer does not control the use of the servers because Customer's only decision-making rights relate to deciding upon the level of network services (the output of the servers) before the period of use—the level of network services cannot be changed during the period of use without modifying the contract. For example, even though Customer produces the data to be transported, that activity does not directly affect the configuration of the network services and, thus, it does not affect how and for what purpose the servers are used.

Supplier is the only party that can make relevant decisions about the use of the servers during the period of use. Supplier has the right to decide how data is transported using the servers, whether to reconfigure the servers and whether to use the servers for another purpose. Accordingly, Supplier controls the use of the servers in providing network services to Customer.

Example 10B: Customer enters into a contract with an information technology company (Supplier) for the use of an identified server for three years. Supplier delivers and installs the server at Customer's premises in accordance with Customer's instructions, and provides repair and maintenance services for the server, as needed, throughout the period of use. Supplier substitutes the server only in the case of malfunction. Customer decides which data to store on the server and how to integrate the server within its operations. Customer can change its decisions in this regard throughout the period of use.

The contract contains a lease. Customer has the right to use the server for three years.

There is an identified asset. The server is explicitly specified in the contract. Supplier can substitute the server only if it is malfunctioning (see paragraph AG19).

Customer has the right to control the use of the server throughout the three-year period of use because:

(a) Customer has the right to obtain substantially all of the economic benefits or service potential from use of the server over the three-year period of use. Customer has exclusive use of the server throughout the period of use.

(b) Customer has the right to direct the use of the server (because the conditions in paragraph AG25(a) exist). Customer makes the relevant decisions about how and for what purpose the server is used because it has the right to decide which aspect of its operations the server is used to support and which data it stores on the server. Customer is the only party that can make decisions about the use of the server during the period of use.

Example 10A–Access Rights

A Government Agency (Entity) enters into a contract with a public sector entity (Customer) to convey the right of access to land in a forest and to small station cabins for use by the Customer's employees in the course of its operations for a period of five years. The Customer uses the land to feed sheep and cows that are to be sold in the course of its operations. From season to season, the Entity has the discretion to change the portion of land and the small station cabins used by the Customer depending on other Entity's activities that take place on the land. The Customer pays the transaction consideration upfront to the Entity for the use of the land and small station cabins.

The contract does not contain a lease of land or of small station cabins.

Although the land used by Customer is specified in the contract, there is no identified asset. The contract is to use land and small station cabins, and this can change without much impact on both Entity's and Customer's operations.

The Customer does not have the right to obtain substantially all of the economic benefits of service potential from the use of the land and of the small station cabins because the Entity can still obtain much more economic benefit and service potential from other operations.

The Customer does not have the right to direct the use because the Entity can change the land and the small station cabins that the Customer is allowed to use.

Example 10B–Shared Properties

Municipality A (Entity) enters into a contract with Government Agency B (Customer) to share the use of a floor in an office building for three years. The Entity will continue to use the floor for the majority of the time and coordinates with the Customer the dates that each can use it for its own activities. The Customer pays transaction consideration upfront to the Entity each month, based on the number of days it plans to use the office space.

The contract does not contain a lease of the floor.

Although the Customer has the right to direct the use of the floor in the days that it is using it, the Customer does not have the right to obtain substantially all of the economic benefits or service potential from the use of the floor because the Entity continues to use the floor for the majority of the time during the contract term and, therefore, obtaining substantially all of the economic benefits or service potential from the use of the floor.

Assessing Whether the Lease is at Market Terms or at Below-Market Terms (see paragraphs 18A–18D, AG32A, and AG60–AG62)

IE2A. The following examples illustrate how an entity assesses whether a lease is at market terms or at below-market terms.

Example 10C–Assessing Whether the Lease is at Market Terms or at Below-Market Terms

Municipality A (Lessee) enters into a lease contract with Government Agency B (Lessor) to use ten units in a building for its office operations for a ten-year period. The lease contract states that the Lessee agrees to pay the Lessor CU100,000 per month. The Lessor usually leases those units for CU185,000 per month,

which is the current market rate, to private sector entities for the same purpose. The Lessor decided to lease those units at below-market terms because the Lessee is running a specific sports program for youth.

The lease is at below-market terms at inception and at commencement dates.

Lease Incentives and Lease Concessions (see paragraphs 5, 18A–18D, AG32A, and AG60–AG62)

IE2B. The following examples illustrate how an entity distinguishes a lease incentive from a lease concession.

Example 10D–Lease Incentives

Private sector entity Y (Lessor) has for lease ten units in a building for office operations for CU110,000 per month. Government agency X (Lessee) is interested in leasing those ten units for a prolonged period of time and has lesser credit risk. The Lessee ended up entering into the lease because the Lessor reduced the price of the lease payments by CU5,000 per month, to match market rates at inception.

The CU5,000 per month reduction is a lease incentive at inception and at commencement dates.

Example 10E–Lease Concessions

Government agency Z (Lessor) has built and has for lease a multi-purpose sports complex for youth. The local sports club W (Lessee) wants to expand its activities in terms of numbers of athletes and types of sports being offered by the club. The Lessor intends to expand the sports activity among youth in the area of the multi-purpose sports complex as a way to support its goals in terms of youth from low-income households. By leasing out the sports complex to the Lessee, it would meet its policy objectives. The lease payments at market rates for a similar multi-purpose sports complex are CU150,000. However, the Lessee does not have the financial capacity to pay the lease payments, and pay, at the same time, the costs of managing such a large facility. The Lessor and Lessee ended up signing up the lease contract for CU45,000 per month because the Lessee was the right partner to achieve the Lessor's goals.

The CU105,000 per month reduction is a lease concession at inception and at commencement dates.

Leases of Low-Value Assets and Portfolio Application (see paragraphs 6–7, AG1 and AG4–AG9)

IE3. The following example illustrates how a lessee might (a) apply paragraphs AG4–AG9 of IPSAS 43 to leases of low-value assets; and (b) determine portfolios of leases to which it would apply the requirements in IPSAS 43.

Example 11–Leases of Low-Value Assets and Portfolio Application

A public sector entity (Lessee) with offices in each province/state of the country has the following leases:

(a) Leases of real estate (both office buildings and warehouses).

(b) Leases of hospital equipment.

(c) Leases of cars, both for services personnel and senior management and of varying quality, specification and value.

(d) Leases of trucks and vans used for service delivery purposes, of varying size and value.

(e) Leases of IT equipment for use by individual employees (such as laptop computers, desktop computers, hand held computer devices, desktop printers and mobile phones).

(f) Leases of servers, including many individual modules that increase the storage capacity of those servers. The modules have been added to the mainframe servers over time as Lessee has needed to increase the storage capacity of the servers.

(g) Leases of office equipment:

(i) Office furniture (such as chairs, desks and office partitions);

(ii) Water dispensers; and

(iii) High-capacity multifunction photocopier devices.

Leases of low-value assets

Lessee determines that the following leases qualify as leases of low-value assets on the basis that the underlying assets, when new, are individually of low value:

(a) Leases of IT equipment for use by individual employees; and

(b) Leases of office furniture and water dispensers.

Lessee elects to apply the requirements in paragraph 7 of IPSAS 43 in accounting for all of those leases.

Although each module within the servers, if considered individually, might be an asset of low value, the leases of modules within the servers do not qualify as leases of low-value assets. This is because each module is highly interrelated with other parts of the servers. Lessee would not lease the modules without also leasing the servers.

Portfolio application

As a result, Lessee applies the recognition and measurement requirements in IPSAS 43 to its leases of real estate, hospital equipment, cars, trucks and vans, servers and high-capacity multifunction photocopier devices. In doing so, Lessee groups its cars, trucks and vans into portfolios.

Lessee's cars are leased under a series of master lease agreements. Lessee uses eight different types of car, which vary by price and are assigned to staff on the basis of seniority and territory. Lessee has a master lease agreement for each different type of car. The individual leases within each master lease agreement are all similar (including similar start and end dates), but the terms and conditions generally vary from one master lease agreement to another. Because the individual leases within each master lease agreement are similar to each other, Lessee reasonably expects that applying the requirements of IPSAS 43 to each master lease agreement would not result in a materially different effect than applying the requirements of IPSAS 43 to each individual lease within the master lease agreement. Consequently, Lessee concludes that it can apply the requirements of IPSAS 43 to each master lease agreement as a portfolio. In addition, Lessee concludes that two of the eight master lease agreements are similar and cover substantially similar types of cars in similar territories. Lessee reasonably expects that the effect of applying IPSAS 43 to the combined portfolio of leases within the two master lease agreements would not differ materially from applying IPSAS 43 to each lease within that combined portfolio. Lessee, therefore, concludes that it can further combine those two master lease agreements into a single lease portfolio.

Lessee's trucks and vans are leased under individual lease agreements. There are 6,500 leases in total. All of the truck leases have similar terms, as do all of the van leases. The truck leases are generally for four years and involve similar models of truck. The van leases are generally for five years and involve similar models of van. Lessee reasonably expects that applying the requirements of IPSAS 43 to portfolios of truck leases and van leases, grouped by type of underlying asset, territory and the quarter of the year within which the lease was entered into, would not result in a materially different effect from applying those requirements to each individual truck or van lease. Consequently, Lessee applies the requirements of IPSAS 43 to different portfolios of truck and van leases, rather than to 6,500 individual leases.

Allocating Consideration to Components of a Contract (see paragraphs 13–17 and AG33–AG34)

IE4. The following example illustrates the allocation of consideration in a contract to lease and non-lease components by a lessee.

Example 12–Lessee allocation of consideration to lease and non-lease components of a contract

Lessor leases a server, a medical ventilator and a computed tomography machine to Lessee to be used in Lessee's hospital operations for four years. Lessor also agrees to maintain each item of equipment throughout the lease term. The total consideration in the contract is CU600,000[(a)], payable in annual instalments of CU150,000, and a variable amount that depends on the hours of work performed in maintaining the computed tomography machine. The variable payment is capped at 2 per cent of the replacement cost of the computed tomography machine. The consideration includes the cost of maintenance services for each item of equipment.

Lessee accounts for the non-lease components (maintenance services) separately from each lease of equipment applying paragraph 13 of IPSAS 43. Lessee does not elect the practical expedient in paragraph 16 of IPSAS 43. Lessee considers the requirements in paragraph AG33 of IPSAS 43 and concludes that the lease of the server, the lease of the *medical ventilator* and the lease of the *computed tomography machine* are each separate lease components. This is because:

(a) Lessee can benefit from use of each of the three items of equipment on its own or together with other readily available resources (for example, Lessee could readily lease or purchase an alternative medical ventilator or computed tomography machine to use in its operations); and

(b) Although Lessee is leasing all three items of equipment for one purpose (i.e., to engage in hospital operations), the machines are neither highly dependent on, nor highly interrelated with, each other. Lessee's ability to derive benefit from the lease of each item of equipment is not significantly affected by its decision to lease, or not lease, the other equipment from Lessor.

Consequently, Lessee concludes that there are three lease components and three non-lease components (maintenance services) in the contract. Lessee applies the guidance in paragraphs 14–15 of IPSAS 43 to allocate the consideration in the contract to the three lease components and the non-lease components.

Several suppliers provide maintenance services for a similar server and a similar medical ventilator. Accordingly, there are observable standalone prices for the maintenance services for those two items of leased equipment. Lessee is able to establish observable stand-alone prices for the maintenance of the server and the medical ventilator of CU32,000 and CU16,000, respectively, assuming similar payment terms to those in the contract with Lessor. The computed tomography machine is highly specialized and, accordingly, other suppliers do not lease or provide maintenance services for similar computed tomography machines. Nonetheless, Lessor provides four-year maintenance service contracts to customers that purchase similar computed tomography machine from Lessor. The observable consideration for those four-year maintenance service contracts is a fixed amount of CU56,000, payable over four years, and a variable amount that depends on the hours of work performed in maintaining the computed tomography machine. That variable payment is capped at 2 per cent of the replacement cost of the computed tomography machine. Consequently, Lessee estimates the stand-alone price of the maintenance services for the computed tomography machine to be CU56,000 plus any variable amounts. Lessee is able to establish observable stand-alone prices for the leases of the server, the desktop computer and the computed tomography machine of CU170,000, CU102,000 and CU224,000, respectively.

Lessee allocates the fixed consideration in the contract (CU600,000) to the lease and non-lease components as follows:

CU	**Server**	**Medical ventilator**	**Computed tomography machine**	**Total**
Lease	170.000	102.000	224.000	**496.000**
Non-lease				**104.000**

Total fixed consideration				**600.000**

Lessee allocates all of the variable consideration to the maintenance of the *computed tomography machine*, and, thus, to the non-lease components of the contract. Lessee then accounts for each lease component applying the guidance in IPSAS 43, treating the allocated consideration as the lease payments for each lease component.

(a) In these Illustrative Examples, currency amounts are denominated in 'currency units' (CU).

Lessee Measurement (see paragraphs 19–42, AG35–AG42, and AG60–AG61)

IE5. The following example illustrates how a lessee measures right-of-use assets, lease liabilities, and concessionary leases. It also illustrates how a lessee accounts for a change in the lease term.

Example 13–Measurement by a Lessee and Accounting for a Change in the Lease Term

Part 1—Initial Measurement of the Right-of-Use Asset and the Lease Liability

Lessee enters into a 10-year lease of a floor of a building, with an option to extend for five years. Lease payments are CU50,000 per year during the initial term and CU55,000 per year during the optional period, all payable at the beginning of each year. To obtain the lease, Lessee incurs initial direct costs of CU20,000, of which CU15,000 relates to a payment to a former tenant occupying that floor of the building and CU5,000 relates to a commission paid to the real estate agent that arranged the lease. As an incentive to Lessee for entering into the lease, Lessor agrees to reimburse to Lessee the real estate commission of CU5,000.

At the commencement date, Lessee concludes that it is not reasonably certain to exercise the option to extend the lease and, therefore, determines that the lease term is 10 years.

The interest rate implicit in the lease is not readily determinable. Lessee's incremental borrowing rate is 5 per cent per annum, which reflects the fixed rate at which Lessee could borrow an amount similar to the value of the right-of-use asset, in the same currency, for a 10-year term, and with similar collateral.

At the commencement date, Lessee makes the lease payment for the first year, incurs initial direct costs, receives the lease incentive from Lessor and measures the lease liability at the present value of the remaining nine payments of CU50,000, discounted at the interest rate of 5 per cent per annum, which is CU355,391.

Lessee initially recognizes assets and liabilities in relation to the lease as follows.

Right-of-use asset	CU405,391		
Lease liability		CU355,391	
Cash (lease payment for the first year)			CU50,000
Right-of-use asset	CU20,000		
Cash (initial direct costs)		CU20,000	
Cash (lease incentive)	CU5,000		
Right-of-use asset		CU5,000	

Part 2—Subsequent Measurement and Accounting for a Change in the Lease Term

In the sixth year of the lease, Lessee acquires Entity A. Entity A has been leasing a floor in another building. The lease entered into by Entity A contains a termination option that is exercisable by Entity A. Following the acquisition of Entity A, Lessee needs two floors in a building suitable for the increased workforce. To minimize costs, Lessee (a) enters into a separate eight-year lease of another floor in the building leased that will be

available for use at the end of Year 7 and (b) terminates early the lease entered into by Entity A with effect from the beginning of Year 8.

Moving Entity A's staff to the same building occupied by Lessee creates an economic incentive for Lessee to extend its original lease at the end of the non-cancellable period of 10 years. The acquisition of Entity A and the relocation of Entity A's staff is a significant event that is within the control of Lessee and affects whether Lessee is reasonably certain to exercise the extension option not previously included in its determination of the lease term. This is because the original floor has greater utility (and thus provides greater benefits) to Lessee than alternative assets that could be leased for a similar amount to the lease payments for the optional period—Lessee would incur additional costs if it were to lease a similar floor in a different building because the workforce would be located in different buildings. Consequently, at the end of Year 6, Lessee concludes that it is now reasonably certain to exercise the option to extend its original lease as a result of its acquisition and planned relocation of Entity A.

Lessee's incremental borrowing rate at the end of Year 6 is 6 per cent per annum, which reflects the fixed rate at which Lessee could borrow an amount similar to the value of the right-of-use asset, in the same currency, for a nine-year term, and with similar collateral. Lessee expects to consume the right-of-use asset's future economic benefits or service potential evenly over the lease term and, thus, depreciates the right-of-use asset on a straight-line basis.

The right-of-use asset and the lease liability from Year 1 to Year 6 are as follows.

	Lease liability				**Right-of-use asset**		
Year	**Beginning balance CU**	**Lease payment CU**	**5% interest expense CU**	**Ending balance CU**	**Beginning balance CU**	**Depreciation charge CU**	**Ending balance CU**
1	**355,391**	-	17,770	**373,161**	**420,391**	(42,039)	**378,352**
2	**373,161**	(50,000)	16,158	**339,319**	**378,352**	(42,039)	**336,313**
3	**339,319**	(50,000)	14,466	**303,785**	**336,313**	(42,039)	**294,274**
4	**303,785**	(50,000)	12,689	**266,474**	**294,274**	(42,039)	**252,235**
5	**266,474**	(50,000)	10,823	**227,297**	**252,235**	(42,039)	**210,196**
6	**227,297**	(50,000)	8,865	**186,162**	**210,196**	(42,039)	**168,157**

At the end of the sixth year, before accounting for the change in the lease term, the lease liability is CU186,162 (the present value of four remaining payments of CU50,000, discounted at the original interest rate of 5 per cent per annum). Interest expense of CU8,865 is recognized in Year 6. Lessee's right-of-use asset is CU168,157.

Lessee remeasures the lease liability at the present value of four payments of CU50,000 followed by five payments of CU55,000, all discounted at the revised discount rate of 6 per cent per annum, which is CU378,174. Lessee increases the lease liability by CU192,012, which represents the difference between the remeasured liability of CU378,174 and its previous carrying amount of CU186,162. The corresponding adjustment is made to the right-of-use asset to reflect the cost of the additional right of use, recognized as follows.

Right-of-use asset	CU192,012	
Lease liability		CU192,012

Following the remeasurement, the carrying amount of Lessee's right-of-use asset is CU360,169 (i.e., CU168,157 + CU192,012). From the beginning of Year 7 Lessee calculates the interest expense on the lease liability at the revised discount rate of 6 per cent per annum.

The right-of-use asset and the lease liability from Year 7 to Year 15 are as follows.

	Lease liability				Right-of-use asset		
Year	Beginning balance CU	Lease payment CU	6% interest expense CU	Ending balance CU	Beginning balance CU	Depreciation charge CU	Ending balance CU
7	**378,174**	(50,000)	19,690	**347,864**	**360,169**	(40,019)	**320,150**
8	**347,864**	(50,000)	17,872	**315,736**	**320,150**	(40,019)	**280,131**
9	**315,736**	(50,000)	15,944	**281,680**	**280,131**	(40,019)	**240,112**
10	**281,680**	(50,000)	13,901	**245,581**	**240,112**	(40,019)	**200,093**
11	**245,581**	(55,000)	11,435	**202,016**	**200,093**	(40,019)	**160,074**
12	**202,016**	(55,000)	8,821	**155,837**	**160,074**	(40,019)	**120,055**
13	**155,837**	(55,000)	6,050	**106,887**	**120,055**	(40,019)	**80,036**
14	**106,887**	(55,000)	3,113	**55,000**	**80,036**	(40,018)	**40,018**
15	**55,000**	(55,000)	-	**-**	**40,018**	(40,018)	**-**

Example 13A–Concessionary Lease (Lessee)–Concession Results from 30% Lower Contractual Payments than Payments for the Lease at Market Rates

Public sector not-for-profit entity X (Lessee) enters into a lease with Municipality Y (Lessor) to use a building to provide medical services to the population over a period of five years. The Lessor does not regulate the types of medical services provided to the population.

The annual payment for the lease at market rates based on the current use of the underlying asset is CU5,312,420.

- *The lease stipulates that the lease should be paid over the five-year period as follows:*

  Year 1: CU3,718,694

  Year 2: CU3,718,694

  Year 3: CU3,718,694

  Year 4: CU3,718,694

  Year 5: CU3,718,694

  This represents an agreed reduction of 30% to the lease payments at market rates. The lessee's incremental borrowing rate is 5 percent per annum which is readily determinable by the lessee.

- *The lease includes a compliance obligation, specifically to use the building to provide medical services to the population for five years. To the extent the compliance obligation is not met, the lease is cancelled, and the right to use the underlying asset returns to the lessor. The compliance obligation is met on a straight-line basis.*

- *Depreciation of the right-of-use asset is not considered in the example for simplification purposes.*

Analysis

It is a concessionary lease, as the present value of payments for the lease at market rates based on the current use of the underlying asset is higher than the present value of the contractual payments. The lessee has effectively received a concession of CU6,900,000, which is the difference between the present value of the payments for the lease at market rates–see Table 1 below–and the present value of the contractual

payments. (Note: An entity would consider whether the substance of the CU6,900,000 is a contribution from owners or revenue; assume for purposes of this example that the CU6,900,000 is revenue).

The concession component of CU6,900,000 is accounted for in accordance with IPSAS 47, and the present value of annual contractual payments of CU16,100,000 in accordance with this Standard.

The journal entries to account for the concessionary lease are as follows:

1. On initial recognition, the lessee recognizes the following (the lessee subsequently measures the lease liability at amortized cost):

Dr	Right-of-use asset	CU23,000,000		
Cr	Lease liability (refer to Table 1 below)			CU16,100,00
Cr	Liability (refer to Table 1 below)			CU6,900,000

Recognition of the lease at the present value of payments for the lease at market rates based on the current use of the asset.

IPSAS 47 is considered in recognizing either a liability or revenue for the concession component of the lease. Paragraph IE308 of that Standard provides journal entries for the recognition and measurement of the concession component of the lease.

2. Year 1: The lessee recognizes the following:

Dr	Interest expense (refer to Table 2 below)	CU805,000	
Cr	Lease liability		CU805,000

Recognition of interest using the effective interest method (CU16,100,000 × 5%)

Dr	Lease liability (refer to Table 2 below)	CU3,718,694	
Cr	Bank		CU3,718,694

Recognition of lease payment

3. Year 2: The lessee recognizes the following:

Dr	Interest expense	CU659,315	
Cr	Lease liability		CU659,315

Recognition of interest using the effective interest method (CU13,186,306 × 5%)

Dr	Lease liability	CU3,718,694	
Cr	Bank		CU3,718,694

Recognition of lease payment

4. Year 3: The lessee recognizes the following:

Dr	Interest expense	CU506,346	
Cr	Lease liability		CU506,346

Recognition of interest using the effective interest method (CU10,126,927 × 5%)

Dr	Lease liability		CU3,718,694	
Cr	Bank			CU3,718,694

Recognition of lease payment

5. Year 4: The lessee recognizes the following:

Dr	Interest expense		CU345,729	
Cr	Lease liability			CU345,729

Recognition of interest using the effective interest method (CU6,914,579 × 5%)

Dr	Lease liability		CU3,718,694	
Cr	Bank			CU3,718,694

Recognition of lease payment

6. Year 5: The lessee recognizes the following:

Dr	Interest expense		CU177,081	
Cr	Lease liability			CU177,081

Recognition of interest using the effective interest method (CU3,541,614 × 5%)

Dr	Lease liability		CU3,718,694	
Cr	Bank			CU3,718,694

Recognition of lease payment

Calculations:

Table 1: Annual Payments (Using Market Interest Rate at 5%)

	Undiscounted Annual Payments for the Lease at Market Rates	Present Value of Payments for the Lease at Market Rates	Undiscounted Annual Contractual Payments	Present Value of Annual Contractual Payments	Concession component of the lease to be recognized as revenue
	(1)	(2)	(3)	(4)	5=(2)-(4)

Right-of-use asset	23,000,000
Less: Present value of cash outflows (lease liability on initial recognition)	16,100,000
Concession component of the lease to be recognized as revenue over five years.	6,900,000

Variable Lease Payments (see paragraphs 28, 40, 43(b) and 44)

IE6. The following example illustrates how a lessee accounts for variable lease payments that depend on an index and variable lease payments not included in the measurement of the lease liability.

Example 14–Variable Lease Payments Dependent on an Index and Variable Lease Payments Linked to Sales

Example 14A—Lessee enters into a 10-year lease of property with annual lease payments of CU50,000, payable at the beginning of each year. The contract specifies that lease payments will increase every two years on the basis of the increase in the Consumer Price Index for the preceding 24 months. The Consumer Price Index at the commencement date is 125. This example ignores any initial direct costs. The rate implicit in the lease is not readily determinable. Lessee's incremental borrowing rate is 5 per cent per annum, which reflects the fixed rate at which Lessee could borrow an amount similar to the value of the right-of-use asset, in the same currency, for a 10-year term, and with similar collateral.

At the commencement date, Lessee makes the lease payment for the first year and measures the lease liability at the present value of the remaining nine payments of CU50,000, discounted at the interest rate of 5 per cent per annum, which is CU355,391.

Lessee initially recognizes assets and liabilities in relation to the lease as follows.

Right-of-use asset	CU405,391	
Lease liability		CU355,391
Cash (lease payment for the first year)		CU50,000

Lessee expects to consume the right-of-use asset's future economic benefits evenly over the lease term and, thus, depreciates the right-of-use asset on a straight-line basis.

During the first two years of the lease, Lessee recognizes in aggregate the following related to the lease.

Interest expense	CU33,928	
Lease liability		CU33,928
Depreciation charge	CU81,078 (CU405,391 ÷ 10 × 2 years)	
Right-of-use asset		CU81,078

At the beginning of the second year, Lessee makes the lease payment for the second year and recognizes the following.

Lease liability	CU50,000	
Cash		CU50,000

At the beginning of the third year, before accounting for the change in future lease payments resulting from a change in the Consumer Price Index and making the lease payment for the third year, the lease liability is CU339,319 (the present value of eight payments of CU50,000 discounted at the interest rate of 5 per cent per annum = CU355,391 + CU33,928 – CU50,000).

At the beginning of the third year of the lease the Consumer Price Index is 135.

The payment for the third year, adjusted for the Consumer Price Index, is CU54,000 (CU50,000 × 135 ÷ 125). Because there is a change in the future lease payments resulting from a change in the Consumer Price Index used to determine those payments, Lessee remeasures the lease liability to reflect those revised lease payments, i.e., the lease liability now reflects eight annual lease payments of CU54,000.

At the beginning of the third year, Lessee remeasures the lease liability at the present value of eight payments of CU54,000 discounted at an unchanged discount rate of 5 per cent per annum, which is CU366,464. Lessee increases the lease liability by CU27,145, which represents the difference between the remeasured liability of CU366,464 and its previous carrying amount of CU339,319. The corresponding adjustment is made to the right-of-use asset, recognized as follows.

Right-of-use asset	CU27,145	
Lease liability		CU27,145

At the beginning of the third year, Lessee makes the lease payment for the third year and recognizes the following.

Lease liability	CU54,000	
Cash		CU54,000

Example 14B—Assume the same facts as Example 14A except that Lessee is also required to make variable lease payments for each year of the lease, which are determined as 1 per cent of Lessee's sales generated from the leased property.

At the commencement date, Lessee measures the right-of-use asset and the lease liability recognized at the same amounts as in Example 14A. This is because the additional variable lease payments are linked to future sales and, thus, do not meet the definition of lease payments. Consequently, those payments are not included in the measurement of the asset and liability.

Right-of-use asset	CU405,391	
Lease liability		CU355,391
Cash (lease payment for the first year)		CU50,000

Lessee prepares financial statements on an annual basis. During the first year of the lease, Lessee generates sales of CU800,000 from the leased property.

Lessee incurs an additional expense related to the lease of CU8,000 (CU800,000 × 1 per cent), which Lessee recognizes in surplus or deficit in the first year of the lease.

Lease Modifications (see paragraphs 45–47)

IE7. Examples 15–19 illustrate the requirements of IPSAS 43 regarding lease modifications for a lessee.

Example 15–Modification that is a Separate Lease

Lessee enters into a 10-year lease for 2,000 square meters of office space. At the beginning of Year 6, Lessee and Lessor agree to amend the original lease for the remaining five years to include an additional 3,000 square meters of office space in the same building. The additional space is made available for use by

Lessee at the end of the second quarter of Year 6. The increase in total consideration for the lease is commensurate with the current market rate for the new 3,000 square meters of office space, adjusted for the discount that Lessee receives reflecting that Lessor does not incur costs that it would otherwise have incurred if leasing the same space to a new tenant (for example, marketing costs).

Lessee accounts for the modification as a separate lease, separate from the original 10-year lease. This is because the modification grants Lessee an additional right to use an underlying asset, and the increase in consideration for the lease is commensurate with the stand-alone price of the additional right-of-use adjusted to reflect the circumstances of the contract. In this example, the additional underlying asset is the new 3,000 square meters of office space. Accordingly, at the commencement date of the new lease (at the end of the second quarter of Year 6), Lessee recognizes a right-of-use asset and a lease liability relating to the lease of the additional 3,000 square meters of office space. Lessee does not make any adjustments to the accounting for the original lease of 2,000 square meters of office space as a result of this modification.

Example 16–Modification that Increases the Scope of the Lease by Extending the Contractual Lease Term

Lessee enters into a 10-year lease for 5,000 square meters of office space. The annual lease payments are CU100,000 payable at the end of each year. The interest rate implicit in the lease cannot be readily determined. Lessee's incremental borrowing rate at the commencement date is 6 per cent per annum. At the beginning of Year 7, Lessee and Lessor agree to amend the original lease by extending the contractual lease term by four years. The annual lease payments are unchanged (i.e., CU100,000 payable at the end of each year from Year 7 to Year 14). Lessee's incremental borrowing rate at the beginning of Year 7 is 7 per cent per annum.

At the effective date of the modification (at the beginning of Year 7), Lessee remeasures the lease liability based on: (a) an eight-year remaining lease term, (b) annual payments of CU100,000 and (c) Lessee's incremental borrowing rate of 7 per cent per annum. The modified lease liability equals CU597,130. The lease liability immediately before the modification (including the recognition of the interest expense until the end of Year 6) is CU346,511. Lessee recognizes the difference between the carrying amount of the modified lease liability and the carrying amount of the lease liability immediately before the modification (CU250,619) as an adjustment to the right-of-use asset.

Example 17–Modification that Decreases the Scope of the Lease

Lessee enters into a 10-year lease for 5,000 square meters of office space. The annual lease payments are CU50,000 payable at the end of each year. The interest rate implicit in the lease cannot be readily determined. Lessee's incremental borrowing rate at the commencement date is 6 per cent per annum. At the beginning of Year 6, Lessee and Lessor agree to amend the original lease to reduce the space to only 2,500 square meters of the original space starting from the end of the first quarter of Year 6. The annual fixed lease payments (from Year 6 to Year 10) are CU30,000. Lessee's incremental borrowing rate at the beginning of Year 6 is 5 per cent per annum.

At the effective date of the modification (at the beginning of Year 6), Lessee remeasures the lease liability based on: (a) a five-year remaining lease term, (b) annual payments of CU30,000 and (c) Lessee's incremental borrowing rate of 5 per cent per annum. This equals CU129,884.

Lessee determines the proportionate decrease in the carrying amount of the right-of-use asset on the basis of the remaining right-of-use asset (i.e., 2,500 square meters corresponding to 50 per cent of the original right-of-use asset).

50 per cent of the pre-modification right-of-use asset (CU184,002) is CU92,001. Fifty per cent of the pre-modification lease liability (CU210,618) is CU105,309. Consequently, Lessee reduces the carrying amount of the right-of-use asset by CU92,001 and the carrying amount of the lease liability by CU105,309. Lessee

recognizes the difference between the decrease in the lease liability and the decrease in the right-of-use asset (CU105,309 – CU92,001 = CU13,308) as a gain in surplus or deficit at the effective date of the modification (at the beginning of Year 6).

Lessee recognizes the difference between the remaining lease liability of CU105,309 and the modified lease liability of CU129,884 (which equals CU24,575) as an adjustment to the right-of-use asset reflecting the change in the consideration paid for the lease and the revised discount rate.

Example 18–Modification that Both Increases and Decreases the Scope of the Lease

Lessee enters into a 10-year lease for 2,000 square meters of office space. The annual lease payments are CU100,000 payable at the end of each year. The interest rate implicit in the lease cannot be readily determined. Lessee's incremental borrowing rate at the commencement date is 6 per cent per annum. At the beginning of Year 6, Lessee and Lessor agree to amend the original lease to (a) include an additional 1,500 square meters of space in the same building starting from the beginning of Year 6 and (b) reduce the lease term from 10 years to eight years. The annual fixed payment for the 3,500 square meters is CU150,000 payable at the end of each year (from Year 6 to Year 8). Lessee's incremental borrowing rate at the beginning of Year 6 is 7 per cent per annum.

The consideration for the increase in scope of 1,500 square meters of space is not commensurate with the stand-alone price for that increase adjusted to reflect the circumstances of the contract. Consequently, Lessee does not account for the increase in scope that adds the right to use an additional 1,500 square meters of space as a separate lease.

The pre-modification right-of-use asset and the pre-modification lease liability in relation to the lease are as follows.

	Lease liability				**Right-of-use asset**		
	Beginning balance	**6% interest expense**	**Lease payment**	**Ending balance**	**Beginning balance**	**Depreciation charge**	**Ending balance**
Year	**CU**	**CU**	**CU**	**CU**	**CU**	**CU**	**CU**
1	**736,009**	44,160	(100,000)	**680,169**	**736,009**	(73,601)	**662,408**
2	**680,169**	40,810	(100,000)	**620,979**	**662,408**	(73,601)	**588,807**
3	**620,979**	37,259	(100,000)	**558,238**	**588,807**	(73,601)	**515,206**
4	**558,238**	33,494	(100,000)	**491,732**	**515,206**	(73,601)	**441,605**
5	**491,732**	29,504	(100,000)	**421,236**	**441,605**	(73,601)	**368,004**
6	**421,236**				**368,004**		

At the effective date of the modification (at the beginning of Year 6), Lessee remeasures the lease liability on the basis of: (a) a three-year remaining lease term, (b) annual payments of CU150,000 and (c) Lessee's incremental borrowing rate of 7 per cent per annum. The modified liability equals CU393,647, of which (a) CU131,216 relates to the increase of CU50,000 in the annual lease payments from Year 6 to Year 8 and (b) CU262,431 relates to the remaining three annual lease payments of CU100,000 from Year 6 to Year 8.

Decrease in the lease term

At the effective date of the modification (at the beginning of Year 6), the pre-modification right-of-use asset is CU368,004. Lessee determines the proportionate decrease in the carrying amount of the right-of-use asset based on the remaining right-of-use asset for the original 2,000 square meters of office space (i.e., a

remaining three-year lease term rather than the original five-year lease term). The remaining right-of-use asset for the original 2,000 square meters of office space is CU220,802 (i.e., CU368,004 ÷ 5 × 3 years).

At the effective date of the modification (at the beginning of Year 6), the pre-modification lease liability is CU421,236. The remaining lease liability for the original 2,000 square meters of office space is CU267,301 (i.e., present value of three annual lease payments of CU100,000, discounted at the original discount rate of 6 per cent per annum).

Consequently, Lessee reduces the carrying amount of the right-of-use asset by CU147,202 (CU368,004 – CU220,802), and the carrying amount of the lease liability by CU153,935 (CU421,236 – CU267,301). Lessee recognizes the difference between the decrease in the lease liability and the decrease in the right-of-use asset (CU153,935 – CU147,202 = CU6,733) as a gain in surplus or deficit at the effective date of the modification (at the beginning of Year 6).

Lease liability	CU153,935	
Right-of-use asset		CU147,202
Gain		CU6,733

At the effective date of the modification (at the beginning of Year 6), Lessee recognizes the effect of the remeasurement of the remaining lease liability reflecting the revised discount rate of 7 per cent per annum, which is CU4,870 (CU267,301 – CU262,431), as an adjustment to the right-of-use asset.

Lease liability	CU4,870	
Right-of-use asset		CU4,870

Increase in the leased space

At the commencement date of the lease for the additional 1,500 square meters of space (at the beginning of Year 6), Lessee recognizes the increase in the lease liability related to the increase in scope of CU131,216 (i.e., present value of three annual lease payments of CU50,000, discounted at the revised interest rate of 7 per cent per annum) as an adjustment to the right-of-use asset.

Right-of-use asset	CU131,216	
Lease liability		CU131,216

The modified right-of-use asset and the modified lease liability in relation to the modified lease are as follows.

	Lease liability				**Right-of-use asset**		
	Beginning balance	**7% interest expense**	**Lease payment**	**Ending balance**	**Beginning balance**	**Depreciation charge**	**Ending balance**
Year	**CU**	**CU**	**CU**	**CU**	**CU**	**CU**	**CU**
6	**393,647**	27,556	(150,000)	**271,203**	**347,148**	(115,716)	**231,432**
7	**271,203**	18,984	(150,000)	**140,187**	**231,432**	(115,716)	**115,716**
8	**140,187**	9,813	(150,000)	**-**	**115,716**	(115,716)	**-**

Example 19–Modification that is a Change in Consideration Only

Lessee enters into a 10-year lease for 5,000 square meters of office space. At the beginning of Year 6, Lessee and Lessor agree to amend the original lease for the remaining five years to reduce the lease payments from CU100,000 per year to CU95,000 per year. The interest rate implicit in the lease cannot be

readily determined. Lessee's incremental borrowing rate at the commencement date is 6 per cent per annum. Lessee's incremental borrowing rate at the beginning of Year 6 is 7 per cent per annum. The annual lease payments are payable at the end of each year.

At the effective date of the modification (at the beginning of Year 6), Lessee remeasures the lease liability based on: (a) a five-year remaining lease term, (b) annual payments of CU95,000 and (c) Lessee's incremental borrowing rate of 7 per cent per annum. Lessee recognizes the difference between the carrying amount of the modified liability (CU389,519) and the lease liability immediately before the modification (CU421,236) of CU31,717 as an adjustment to the right-of-use asset.

Subleases (see paragraph AG59)

IE8. Examples 20–21 illustrate the application of the requirements in IPSAS 43 for an intermediate lessor that enters into a head lease and a sublease of the same underlying asset.

Example 20–Sublease Classified as a Finance Lease

Head lease—An intermediate lessor enters into a five-year lease for 5,000 square meters of office space (the head lease) with Entity A (the head lessor).

Sublease—At the beginning of Year 3, the intermediate lessor subleases the 5,000 square meters of office space for the remaining three years of the head lease to a sublessee.

The intermediate lessor classifies the sublease by reference to the right-of-use asset arising from the head lease. The intermediate lessor classifies the sublease as a finance lease, having considered the requirements in paragraphs 65–70 of IPSAS 43.

When the intermediate lessor enters into the sublease, the intermediate lessor:

(a) Derecognizes the right-of-use asset relating to the head lease that it transfers to the sublessee and recognizes the net investment in the sublease;

(b) Recognizes any difference between the right-of-use asset and the net investment in the sublease in surplus or deficit; and

(c) Retains the lease liability relating to the head lease in its statement of financial position, which represents the lease payments owed to the head lessor.

During the term of the sublease, the intermediate lessor recognizes both finance revenue on the sublease and interest expense on the head lease (Entity A).

Example 21—Sublease Classified as Operating Lease

Head lease—An intermediate lessor enters into a five-year lease for 5,000 square meters of office space (the head lease) with Entity A (the head lessor).

Sublease—At commencement of the head lease, the intermediate lessor subleases the 5,000 square meters of office space for two years to a sublessee.

The intermediate lessor classifies the sublease by reference to the right-of-use asset arising from the head lease. The intermediate lessor classifies the sublease as an operating lease, having considered the requirements in paragraphs 65–70 of IPSAS 43.

When the intermediate lessor enters into the sublease, the intermediate lessor retains the lease liability and the right-of-use asset relating to the head lease in its statement of financial position.

During the term of the sublease, the intermediate lessor:

(a) Recognizes a depreciation charge for the right-of-use asset and interest on the lease liability; and

(b) Recognizes lease revenue from the sublease.

Lessee Disclosure (see paragraphs 62 and AG50–AG51)

IE9. Example 22 illustrates how a lessee with different types of lease portfolios might comply with the disclosure requirements described in paragraphs 62 and AG50 of IPSAS 43 about variable lease payments. This example shows only current period information. IPSAS 1, *Presentation of Financial Statements* requires an entity to present comparative information.

Example 22–Variable Payment Terms

Lessee with a High Volume of Leases with Some Consistent Payment Terms

Example 22A: City XYZ (Lessee) operates four tourism outlets selling touristic merchandise about the city—A, B, C and D. Lessee has a high volume of property leases. Lessee's policy is to negotiate variable payment terms for newly established tourism outlets. Lessee concludes that information about variable lease payments is relevant to users of its financial statements and is not available elsewhere in its financial statements. In particular, Lessee concludes that information about the proportion of total lease payments that arise from variable payments, and the sensitivity of those variable lease payments to changes in sales, is the information that is relevant to users of its financial statements. This information is similar to that reported to Lessee's senior management about variable lease payments.

Some of the property leases within the city contain variable payment terms that are linked to sales generated from the tourism outlet. Variable payment terms are used, when possible, in newly established tourism outlets in order to link rental payments to tourism outlet cash flows and minimize fixed costs. Fixed and variable rental payments by tourism outlet for the period ended 31 December 20X0 are summarized below.

	Tourism outlet	Fixed payments	Variable payments	Total payments	Estimated annual impact on total tourism outlet rent of a 1% increase in sales
	No.	CU	CU	CU	%
A	4,522	3,854	120	3,974	0.03%
B	965	865	105	970	0.11%
C	124	26	163	189	0.86%
D	652	152	444	596	0.74%
	6,263	**4,897**	**832**	**5,729**	**0.15%**

Refer to the management commentary for tourism outlet information presented on a like-for-like basis and to Note X for segmental information applying IPSAS 18, *Segment Reporting* relating to Tourism Outlets A–D.

Example 22B: City XYZ (Lessee) has a high volume of property leases of tourism outlets selling touristic merchandise about the city. Many of these leases contain variable payment terms linked to sales from the store. Lessee's group policy sets out the circumstances in which variable payment terms are used and all lease negotiations must be approved centrally. Lease payments are monitored centrally. Lessee concludes that information about variable lease payments is relevant to users of its financial statements and is not available elsewhere in its financial statements. In particular, Lessee concludes that information about the different types of contractual terms it uses with respect to variable lease payments, the effect of those terms on its financial performance and the sensitivity of variable lease payments to changes in sales is the

information that is relevant to users of its financial statements. This is similar to the information that is reported to Lessee's senior management about variable lease payments.

Many of the property leases within City XYZ contain variable payment terms that are linked to the volume of sales made from leased tourism outlets. These terms are used, when possible, in order to match lease payments with tourism outlets generating higher cash flows. For individual tourism outlets, up to 100 per cent of lease payments are on the basis of variable payment terms and there is a wide range of sales percentages applied. In some cases, variable payment terms also contain minimum annual payments and caps.

Lease payments and terms for the period ended 31 December 20X0 are summarized below.

	Tourism outlets	**Fixed payments**	**Variable payments**	**Total payments**
	No.	**CU**	**CU**	**CU**
Fixed rent only	1,490	1,153	-	1,153
Variable rent with no -minimum	986	-	562	562
Variable rent with minimum	3,089	1,091	1,435	2,526
	5,565	**2,244**	**1,997**	**4,241**

A 1 per cent increase in sales across all tourism outlets in the public sector entity would be expected to increase total lease payments by approximately 0.6–0.7 per cent. A 5 per cent increase in sales across all tourism outlets in the public sector entity would be expected to increase total lease payments by approximately 2.6–2.8 per cent.

Lessee with a High Volume of Leases with a Wide Range of Different Payment Terms

Example 22C: City XYZ (Lessee) has a high volume of property leases of tourism outlets selling touristic merchandise about the city. These leases contain a wide range of different variable payment terms. Lease terms are negotiated and monitored by local management. Lessee concludes that information about variable lease payments is relevant to users of its financial statements and is not available elsewhere in its financial statements. Lessee concludes that information about how its property lease portfolio is managed is the information that is relevant to users of its financial statements. Lessee also concludes that information about the expected level of variable lease payments in the coming year (similar to that reported internally to senior management) is also relevant to users of its financial statements.

Many of the property leases within the city contain variable payment terms. Local management are responsible for store margins. Accordingly, lease terms are negotiated by local management and contain a wide range of payment terms. Variable payment terms are used for a variety of reasons, including minimising the fixed cost base for newly established tourism outlets or for reasons of margin control and operational flexibility. Variable lease payment terms vary widely across the city:

(a) The majority of variable payment terms are based on a range of percentages of tourism outlet sales;

(b) Lease payments based on variable terms range from 0–20 per cent of total lease payments on an individual property; and

(c) Some variable payment terms include minimum or cap clauses.

The overall financial effect of using variable payment terms is that higher rental costs are incurred by tourism outlet with higher sales. This facilitates the management of margins across the city's tourism outlets.

Variable rent expenses are expected to continue to represent a similar proportion of store sales in future years.

IE10. Example 23 illustrates how a lessee with different types of lease portfolios might comply with the disclosure requirements described in paragraphs 62 and AG51 of IPSAS 43 about extension options and termination options. This example shows only current period information. IPSAS 1 requires an entity to present comparative information.

Example 23–Extension Options and Termination Options

Lessee with a High Volume of Leases, that Have a Wide Range of Different Terms and Conditions, which are not Managed Centrally

Example 23A: Lessee has a high volume of equipment leases with a wide range of different terms and conditions. Lease terms are negotiated and monitored by local management. Lessee concludes that information about how it manages the use of termination and extension options is the information that is relevant to users of its financial statements and is not available elsewhere in its financial statements. Lessee also concludes that information about (a) the financial effect of reassessing options and (b) the proportion of its short-term lease portfolio resulting from leases with annual break clauses is also relevant to users of its financial statements.

Extension and termination options are included in a number of equipment leases across the economic entity. Local teams are responsible for managing their leases and, accordingly, lease terms are negotiated on an individual basis and contain a wide range of different terms and conditions. Extension and termination options are included, when possible, to provide local management with greater flexibility to align its need for access to equipment with the fulfilment of customer contracts. The individual terms and conditions used vary across the economic entity.

The majority of extension and termination options held are exercisable only by Lessee and not by the respective lessors. In cases in which Lessee is not reasonably certain to use an optional extended lease term, payments associated with the optional period are not included within lease liabilities.

During 20X0, the financial effect of revising lease terms to reflect the effect of exercising extension and termination options was an increase in recognized lease liabilities of CU489.

In addition, Lessee has a number of lease arrangements containing annual break clauses at no penalty. These leases are classified as short-term leases and are not included within lease liabilities. The short-term lease expense of CU30 recognized during 20X0 included CU27 relating to leases with an annual break clause.

Lessee with a High Volume of Leases with Some Consistent Terms and Options

Example 23B: City XYZ (Lessee) has a high volume of property leases containing penalty free termination options that are exercisable at the option of Lessee. Lessee's policy is to have termination options in leases of more than five years, whenever possible. Lessee has a central property team that negotiates leases. Lessee concludes that information about termination options is relevant to users of its financial statements and is not available elsewhere in its financial statements. In particular, Lessee concludes that information about (a) the potential exposure to future lease payments that are not included in the measurement of lease liabilities and (b) the proportion of termination options that have been exercised historically is the information that is relevant to users of its financial statements. Lessee also notes that presenting this information on the basis of the same operation for which segment information is disclosed applying IPSAS 18 is relevant to

users of its financial statements. This is similar to the information that is reported to Lessee's senior management about termination options.

Many of the property leases across the city contain termination options. These options are used to limit the period to which the city is committed to individual lease contracts and to maximize operational flexibility in terms of opening and closing individual offices. For most leases of offices, recognized lease liabilities do not include potential future rental payments after the exercise date of termination options because Lessee is not reasonably certain to extend the lease beyond that date. This is the case for most leases for which a longer lease period can be enforced only by Lessee and not by the landlord, and for which there is no penalty associated with the option.

Potential future rental payments relating to periods following the exercise date of termination options are summarized below.

Segment	Lease liabilities recognized (discounted)	Potential future lease payments not included in lease liabilities (undiscounted)		
		Payable during 20X1–20X5	Payable during 20X6–20Y0	Total
	CU	CU	CU	CU
Operation A	569	71	94	165
Operation B	2,455	968	594	1,562
Operation C	269	99	55	154
Operation D	1,002	230	180	410
Operation E	914	181	321	502
	5,209	**1,549**	**1,244**	**2,793**

The table below summarizes the rate of exercise of termination options during 20X0.

Segment	Termination option exercisable during 20X0	Termination option not exercised	Termination option exercised
	No. of leases	No. of leases	No. of leases
Operation A	33	30	3
Operation B	86	69	17
Operation C	19	18	1
Operation D	30	5	25
Operation E	66	40	26
	234	**162**	**72**

Example 23C: Lessee has a high volume of large equipment leases containing extension options that are exercisable by Lessee during the lease. Lessee's policy is to use extension options to align, when possible, committed lease terms for large equipment with the initial contractual term of associated customer contracts, whilst retaining flexibility to manage its large equipment and reallocate assets across contracts. Lessee concludes that information about extension options is relevant to users of its financial statements and is not available elsewhere in its financial statements. In particular, Lessee concludes that (a) information about the

potential exposure to future lease payments that are not included in the measurement of lease liabilities and (b) information about the historical rate of exercise of extension options is the information that is relevant to users of its financial statements. This is similar to the information that is reported to Lessee's senior management about extension options.

Many of the large equipment leases across the city contain extension options. These terms are used to maximize operational flexibility in terms of managing contracts. These terms are not reflected in measuring lease liabilities in many cases because the options are not reasonably certain to be exercised. This is generally the case when the underlying large equipment has not been allocated for use on a particular customer contract after the exercise date of an extension option. The table below summarizes potential future rental payments relating to periods following the exercise dates of extension options.

Segment	Lease liabilities recognized (discounted)	Potential future lease payments not included in lease liabilities (discounted)	Historical rate of exercise of extension options
	CU	CU	%
Operation A	569	799	52%
Operation B	2,455	269	69%
Operation C	269	99	75%
Operation D	1,002	111	41%
Operation E	914	312	76%
	5,209	**1,590**	**67%**

Lessor Measurement (see paragraphs 71A, 81A, AG60, and AG62)

IE10A. The following example illustrates how a lessor measures and accounts for concessionary leases.

Example 23A–Concessionary Operating Lease (Lessor)–Concession Results from 30% Lower Contractual Payments than Payments for the Lease at Market Rates

Municipality Y (Lessor) enters into an operating lease with public sector not-for-profit entity X (Lessee) to use a building over a period of five years with the condition to use it for providing medical services to the population in general. The Lessor does not regulate the types of medical services provided to the population.

The annual payment for the lease at market rates based on the current use of the underlying asset is CU5,000,000.

- *The agreement stipulates that the lease should be paid over the five-year period as follows:*

  Year 1: CU3,500,000

  Year 2: CU3,500,000

  Year 3: CU3,500,000

  Year 4: CU3,500,000

  Year 5: CU3,500,000

  This represents an agreed reduction of 30% to the lease payments at market rates. The interest rate implicit in the lease is 5 percent per annum which is readily determinable by the lessee.

- *Depreciation of the underlying asset is not considered in the example because it is within the scope of other IPSAS.*
- *The annual expenses (depreciation and maintenance) of the building are CU4,200,000.*

Analysis

It is a concessionary lease, as the present value of payments for the lease at market rates based on the current use of the underlying asset is higher than the present value of the contractual payments. The concessionary operating lease has two distinct components:

(a) An exchange component—Representing the portion of the economic value created by the lease contract to be received by the lessor as future cash inflows in the form of lease payments and accounted for as revenue (CU3,500,000 per year); and

(b) A foregone revenue component—Representing the foregone revenue by the lessor, which is not recognized as revenue (CU1,500,000 (CU5,000,000 – CU3,500,000)).

The contractual payments are accounted for in accordance with IPSAS 43.

The annual journal entries[1] to account for the concessionary lease are as follows:

Dr Cash	CU3,500,000	
Cr Lease revenue		CU3,500,000

[1] As revenue in an operating lease is recognized on either a straight-line basis or another systematic basis, there is no need to discount the lease payments.

Example 23B–Concessionary Finance Lease (Lessor)–Concession Results from 30% Lower Contractual Payments than Payments for the Lease at Market Rates

Municipality Y (Lessor) enters into a finance lease with public sector not-for-profit entity X (Lessee) to use a building over a period of five years with the condition to use it for providing medical services to the population in general. The Lessor does not regulate the types of medical services provided to the population.

The annual payment for the lease at market rates based on the current use of the underlying asset is CU5,312,420.

- *The agreement stipulates that the lease should be paid over the five-year period as follows:*

Year 1: CU3,718,694

Year 2: CU3,718,694

Year 3: CU3,718,694

Year 4: CU3,718,694

Year 5: CU3,718,694

This represents an agreed reduction of 30% to the lease payments at market rates. The interest rate implicit in the lease is 5 percent per annum which is readily determinable by the lessor.

- *The carrying amount of the underlying asset is CU20,000,000.*
- *The residual value is CU0 (zero) for simplification purposes.*
- *The lease includes compliance obligations. To the extent the conditions are not met, the lease is cancelled, and the right to use the underlying asset returns to the lessor. The conditions are met on a straight-line basis.*

Analysis

It is a concessionary finance lease, as the present value of payments for the lease at market rates based on the current use of the underlying asset is higher than the present value of the contractual payments. The concessionary finance lease has two distinct components:

(a) An exchange component—Representing the portion of the economic value created by the lease contract to be received by the lessor as future cash inflows in the form of lease payments and accounted for as the net investment in the lease (CU16,100,000); and

(b) A foregone revenue component—Representing the foregone revenue by the lessor, which is not recognized as revenue (CU6,900,000 (CU23,000,000 – CU16,100,000)).

The journal entries to account for the concessionary finance lease are as follows:

1. On initial recognition, the lessor recognizes the following (the lessor subsequently measures the lease receivable (net investment in the lease) at amortized cost):

Dr		Lease receivable (refer to Table 1 below)	CU16,100,000	
Dr		Surplus or deficit	CU3,900,000	
	Cr	Derecognition of the underlying asset		CU20,000,00[(2)]

[(2)] Net of accumulated depreciation.

Recognition of the contractual payments for the lease and derecognition of the underlying asset.

2. Year 1: The lessor recognizes the following:

Dr		Lease receivable	CU805,000	
	Cr	Interest revenue (refer to Table 2 below)		CU805,000

Recognition of interest using the effective interest method (CU16,100,000 × 5%)

Dr		Bank	CU3,718,694	
	Cr	Lease receivable (refer to Table 2 below)		CU3,718,694

Recognition of lease payment

3. Year 2: The lessor recognizes the following:

Dr		Lease receivable	CU659,315	
	Cr	Interest revenue		CU659,315

Recognition of interest using the effective interest method (CU13,186,306 × 5%)

Dr		Bank	CU3,718,694	
	Cr	Lease receivable		CU3,718,694

Recognition of lease payment

4. Year 3: The lessor recognizes the following:

Dr		Lease receivable	CU506,346	

	Cr	Interest revenue		CU506,346

Recognition of interest using the effective interest method (CU10,126,927 × 5%)

Dr		Bank	CU3,718,694	
	Cr	Lease receivable		CU3,718,694

Recognition of lease payment

5. Year 4: The lessor recognizes the following:

Dr		Lease receivable	CU345,729	
	Cr	Interest revenue		CU345,729

Recognition of interest using the effective interest method (CU6,914,579 × 5%)

Dr		Bank	CU3,718,694	
	Cr	Lease receivable		CU3,718,694

Recognition of lease payment

6. Year 5: The lessor recognizes the following:

Dr		Lease receivable	CU177,081	
	Cr	Interest revenue		CU177,081

Recognition of interest using the effective interest method (CU3,541,614 × 5%)

Dr		Bank	CU3,718,694	
	Cr	Lease receivable		CU3,718,694

Recognition of lease payment

Calculations:

Table 1: Annual Payments (Using Market Interest Rate at 5%)

	Undiscounted Annual Payments for the Lease at Market Rates	Present Value of Payments for the Lease at Market Rates	Undiscounted Annual Contractual Payments	Present Value of Annual Contractual Payments
	(1)	(2)	(3)	(4)
Year 1	5,312,420	5,059,448	3,718,694	3,541,614
Year 2	5,312,420	4,818,522	3,718,694	3,372,965
Year 3	5,312,420	4,589,068	3,718,694	3,212,348
Year 4	5,312,420	4,370,541	3,718,694	3,059,379
Year 5	5,312,420	4,162,420	3,718,694	2,913,694

Carrying amount of the derecognized underlying asset	20,000,000
Less: Present value of cash inflows (lease receivable on initial recognition)	16,100,000
Loss component with concessionary finance lease.	3,900,000

Sale and Leaseback Transactions (see paragraphs 97–102)

IE11. Examples 24 and 25 illustrate the application of the requirements in paragraphs 98–101 of IPSAS 43 for a seller-lessee and a buyer-lessor.

Example 24–Sale and Leaseback Transaction with fixed payments and above-market terms

An entity (Seller-lessee) sells a building to another entity (Buyer-lessor) for cash of CU2,000,000. Immediately before the transaction, the building is carried at a cost of CU1,000,000. At the same time, Seller-lessee enters into a contract with Buyer-lessor for the right to use the building for 18 years, with annual payments of CU120,000 payable at the end of each year. The terms and conditions of the transaction are such that the transfer of the building by Seller-lessee satisfies the requirements of IPSAS 47, Revenue to be accounted for as a sale of the building. Accordingly, Seller-lessee and Buyer-lessor account for the transaction as a sale and leaseback.

The fair value of the building at the date of sale is CU1,800,000. Because the consideration for the sale of the building is not at fair value, Seller-lessee and Buyer-lessor make adjustments to measure the sale proceeds at fair value. Applying paragraph 100(b) of IPSAS 43, the amount of the excess sale price of CU200,000 (CU2,000,000 – CU1,800,000) is recognized as additional financing provided by Buyer-lessor to Seller-lessee.

The interest rate implicit in the lease is 4.5 per cent per annum, which is readily determinable by Seller-lessee. The present value of the annual payments (18 payments of CU120,000, discounted at 4.5 per cent per annum) is CU1,459,200, of which CU200,000 relates to the additional financing and CU1,259,200 relates to the lease—corresponding to 18 annual payments of CU16,447 and CU103,553, respectively.

Seller-lessee

Applying paragraph 99(a) of IPSAS 43, at the commencement date Seller-lessee measures the right-of-use asset arising from the leaseback of the building at the proportion of the previous carrying amount of the building that relates to the right of use retained by Seller-lessee, which is CU699,555. Seller-lessee calculates this amount as: CU1,000,000 (the carrying amount of the building) × CU1,259,200 (the discounted lease payments for the 18-year right-of-use asset) ÷ CU1,800,000 (the fair value of the building).

Seller-lessee recognizes only the amount of the gain that relates to the rights transferred to Buyer-lessor of CU240,355 calculated as follows. The gain on sale of the building amounts to CU800,000 (CU1,800,000 – CU1,000,000), of which:

(a) CU559,645 (CU800,000 × CU1,259,200 ÷ CU1,800,000) relates to the right to use the building retained by Seller-lessee; and

(b) CU240,355 (CU800,000 × (CU1,800,000 – CU1,259,200) ÷ CU1,800,000) relates to the rights transferred to Buyer-lessor.

At the commencement date, Seller-lessee accounts for the transaction as follows.

Cash	CU2,000,000	
Right-of-use asset	CU699,555	
Building		CU1,000,000
Lease liability		CU1,259,200
Financial liability		CU200,000
Gain on rights transferred		CU240,355

Buyer-lessor

At the commencement date, Buyer-lessor accounts for the transaction as follows.

Building	CU1,800,000	
Financial asset	CU200,000 (18 payments of CU16,447, discounted at 4.5 per cent per annum)	
Cash		CU2,000,000

After the commencement date, Buyer-lessor accounts for the lease by treating CU103,553 of the annual payments of CU120,000 as lease payments. The remaining CU16,447 of annual payments received from Seller-lessee are accounted for as (a) payments received to settle the financial asset of CU200,000 and (b) interest revenue.

IE12. Example 25 illustrates the application of the requirements in paragraph 101A and paragraphs 30–47 of IPSAS 43 in a sale and leaseback transaction with variable lease payments that do not depend on an index or rate.

Example 25–Subsequent measurement of a right-of-use asset and lease liability in a sale and leaseback transaction with variable lease payments that do not depend on an index or rate

An entity (Seller-lessee) sells a building to another entity (Buyer-lessor) for cash of CU1,800,000 (the fair value of the building at the date of sale). Immediately before the transaction, the building is carried at a cost of CU1,000,000. At the same time, Seller-lessee enters into a contract with Buyer-lessor for the right to use the building for five years. Lease payments—payable annually—comprise fixed payments and variable payments that do not depend on an index or rate.

The terms and conditions of the transaction are such that the transfer of the building by Seller-lessee satisfies the requirements of IPSAS 47 to be accounted for as a sale of the building. Accordingly, Seller-lessee accounts for the transaction as a sale and leaseback.

The interest rate implicit in the lease cannot be readily determined. Seller-lessee's incremental borrowing rate is 3 percent per annum.

Applying paragraph 99(a) of IPSAS 43, Seller-lessee determines the proportion of the building transferred to Buyer-lessor that relates to the right of use it retains as 25 percent.[(a)] Consequently, at the commencement date Seller-lessee accounts for the transaction as follows.

Cash	*CU1,800,000*
Right-of-use asset (CU1,000,000 × 25 per cent)	*CU250,000*

Building	*CU1,000,000*
Lease liability	*CU450,000*
Gain on rights transferred ((CU1,800,000 – CU1,000,000) × 75 per cent)	*CU600,000*

Seller-lessee expects to consume the right-of-use asset's future economic benefits evenly over the lease term and, thus, depreciates the right-of-use asset on a straight-line basis.

In measuring the lease liability applying paragraphs 37–47 of IPSAS 43, Seller-lessee develops an accounting policy for determining 'lease payments' in a way that it would not recognize any amount of the gain that relates to the right of use it retains. Depending on the circumstances (including the method Seller-lessee used—applying paragraph 99(a) of IPSAS 43—for determining the measurement of the right-of-use asset and the gain recognized on the transaction at the commencement date), either Approach 1 or Approach 2 could meet the requirements in paragraph 101A.

Approach 1—Expected lease payments at the commencement date

Applying paragraph 101A of IPSAS 43, Seller-lessee determines 'lease payments' to reflect the expected lease payments at the commencement date that, when discounted using its incremental borrowing rate, result in the carrying amount of the lease liability at that date of CU450,000.

The lease liability and the right-of-use asset arising from the leaseback are:

	Lease liability				Right-of-use asset		
Year	**Beginning balance**	**Lease payments[(b)]**	**3 percent interest expense[(c)]**	**Ending balance**	**Beginning balance**	**Depreciation charge**	**Ending balance**
	CU	**CU**	**CU**	**CU**	**CU**	**CU**	**CU**
1	**450,000**	(95,902)	13,500	**367,598**	**250,000**	(50,000)	**200,000**
2	**367,598**	(98,124)	11,028	**280,502**	**200,000**	(50,000)	**150,000**
3	**280,502**	(99,243)	8,415	**189,674**	**150,000**	(50,000)	**100,000**
4	**189,674**	(100,101)	5,690	**95,263**	**100,000**	(50,000)	**50,000**
5	**95,263**	(98,121)	2,858	**0**	**50,000**	(50,000)	**0**

In applying paragraph 101A and paragraph 39(b) of IPSAS 43, Seller-lessee recognizes in surplus or deficit the difference between the payments made for the lease and the lease payments that reduce the carrying amount of the lease liability. For example, if Seller-lessee pays CU99,321 for the use of the building in Year 2, it recognizes CU1,197 (CU99,321 – CU98,124) in surplus or deficit.

Approach 2—Equal lease payments over the lease term

Applying paragraph 101A of IPSAS 43, Seller-lessee determines 'lease payments' to reflect equal periodic payments over the lease term that, when discounted using its incremental borrowing rate, result in the carrying amount of the lease liability at the commencement date of CU450,000.

The lease liability and the right-of-use asset arising from the leaseback are:

Year	Lease liability				Right-of-use asset		
	Beginning balance	Lease payments[d]	3 percent interest expense[c]	Ending balance	Beginning balance	Depreciation charge	Ending balance
	CU	CU	CU	CU	CU	CU	CU
1	**450,000**	(98,260)	13,500	**365,240**	**250,000**	(50,000)	**200,000**
2	**365,240**	(98,260)	10,957	**277,937**	**200,000**	(50,000)	**150,000**
3	**277,937**	(98,260)	8,338	**188,015**	**150,000**	(50,000)	**100,000**
4	**188,015**	(98,260)	5,640	**95,395**	**100,000**	(50,000)	**50,000**
5	**95,395**	(98,260)	2,865	**0**	**50,000**	(50,000)	**0**

In applying paragraph 101A and paragraph 39(b) of IPSAS 43, Seller-lessee recognizes in surplus or deficit the difference between the payments made for the lease and the lease payments that reduce the carrying amount of the lease liability. For example, if Seller-lessee pays CU99,321 for the use of the building in Year 2, it recognizes CU1,061 (CU99,321 – CU98,260) in surplus or deficit.

[a] Applying paragraph 99(a) of IPSAS 43, Seller-lessee determines the proportion of the building transferred to Buyer-lessor that relates to the right of use retained by comparing, at the commencement date, the right of use it retains via the leaseback to the rights comprising the entire building. Paragraph 99(a) does not prescribe a particular method for determining that proportion.

[b] Applying paragraph 101A and paragraph 37(b) of IPSAS 43, Seller-lessee reduces the carrying amount of the lease liability with 'lease payments' that reflect the expected lease payments estimated at the commencement date and, when discounted, result in the carrying amount of the lease liability at that date of CU450,000.

[c] Applying paragraph 101A and paragraph 37(a) of IPSAS 43, Seller-lessee increases the carrying amount of the lease liability to reflect interest on the lease liability using its incremental borrowing rate.

[d] Applying paragraph 101A and paragraph 37(b) of IPSAS 43, Seller-lessee reduces the carrying amount of the lease liability with 'lease payments' that reflect equal periodic payments over the lease term that, when discounted, result in the carrying amount of the lease liability at the commencement date of CU450,000.

IE13. Example 26 illustrates the application of the requirements in paragraphs 97A–97B of IPSAS 43 in a sale and leaseback transaction with an embedded concession at the inception of the lease.

Example 26–Sale at Market Terms and Leaseback at Below-Market Terms

Museum A (Seller-lessee) has faced some financial difficulties due to expected increasing maintenance costs to fulfill new safety measures required for their architecturally unique building. Therefore, Seller-lessee sells the building to local government X (Buyer-lessor) at its current market price. Seller-lessee enters into a contract with Buyer-lessor for the right to use the building for 18 years with an annual payment which is at below-market terms. Buyer-lessor ensures, with this contract, that the main tourist attraction in the region keeps open for all visitors.

Seller-lessee sells the building, which has a total useful life of 25.5 years, to Buyer-lessor at its current market price (fair value) for cash of CU1,800,000. Immediately before the transaction, the building is carried at a cost of CU1,000,000. At the same time, Seller-lessee enters into a contract with Buyer-lessor for the right to use the building for 18 years, with annual payments of CU103,553 at the end of each year. The terms and conditions of the transaction are such that the transfer of the building by Seller-lessee satisfies the requirements of IPSAS 47, Revenue. This example ignores any initial direct costs. The annual payment at market rates is CU120,000.

As the sale is at fair value, the sale is at market terms. As the lease payments are at below-market terms, the leaseback has an embedded concession.

Accordingly, Seller-lessee and Buyer-lessor account for the transaction as a sale at market terms and a leaseback at below-market terms.

The interest rate implicit in the lease is 4.5 percent per annum, which is readily determinable by Seller-lessee. The present value of the contractual annual payments (18 payments of CU103,553 discounted at 4.5 percent per annum), amounts to CU1,259,204.

There are no compliance obligations attached to the leaseback transaction.

Seller-lessee

At the commencement date, Seller-lessee measures the right-of-use asset arising from the leaseback of the building at the proportion of the previous carrying amount of the building that relates to the right of use retained by Seller-lessee, which is CU810,667. This is calculated as: CU1,000,000 (the carrying amount of the building) ÷ CU1,800,000 (the fair value of the building) × CU1,459,199 (the discounted payments for the lease at market rates for the 18-year right-of-use asset).

Seller-lessee recognizes only the amount of the gain that relates to the rights transferred to Buyer-lessor of CU151,467 calculated as follows. The gain on sale of the building amounts to CU800,000 (CU1,800,000 – CU1,000,000), of which:

(a) CU648,533 (CU1,459,200 × CU800,000 ÷ CU1,800,000) relates to the right to use the building retained by Seller-lessee; and

(b) CU151,467 (CU340,801 × CU800,000 ÷ CU1,800,000) relates to the rights transferred to Buyer-lessor.

Further calculations:

(a) CU340,801 (CU1,800,000-CU1,459,199) related to rights retained by the Buyer-lessor (unguaranteed residual value at the beginning of the lease).

(b) CU199,995 (CU1,459,199-CU1,259,204) related to the concession.

At the commencement date, Seller-lessee accounts for the transaction as follows.

Dr Cash	CU1,800,000	
Dr Right-of-use asset	CU810,666	
Cr Building		CU1,000,000
Cr Lease liability		CU1,259,204
Cr Revenue		CU199,995
Cr Gain on rights transferred		CU151,467

Buyer-lessor

The Buyer-lessor classifies the lease as a finance lease.

At the commencement date, Buyer-lessor accounts for the transaction as follows.

Dr Building	CU1,800,000
Dr Financial asset	CU1,600,005 (18 payments of CU103,553, discounted at 4.5 per cent per annum (CU1,259,204) + unguaranteed residual value (CU340,801))

Dr Surplus or deficit (Concession expense)	CU199.995	
Cr Cash		CU1,800,000
Cr Building (value of the rights transferred to the Seller-lessee)		CU1,459,199
Cr Building (unguaranteed residual value)		CU340,801

After the commencement date, the Seller-lessee and Buyer-lessor account for the lease by treating CU103,553 as lease payments.

COMPARISON WITH IFRS 16

IPSAS 43, *Leases* is drawn primarily from IFRS 16 (2016) *Leases*, including amendments up to March 2021.

The main differences between IPSAS 43 and IFRS 16 are as follows:

- IPSAS 43 uses different terminology from IFRS 16. For example, IPSAS 43 uses the terms “revenue”, “operation”, “accumulated surpluses/(deficits)” and “segment”, while IFRS 16 uses the terms “income”, “business unit”, “retained earnings” and “business segment’, respectively.
- IPSAS 43 refers to both “economic benefits” and “service potential”, where appropriate, in the section on identifying a lease, while IFRS 16 refers only to “economic benefits”.
- IPSAS 43 does not include specific requirements for manufacturer or dealer lessors, whereas IFRS 16 does.
- IPSAS 43 includes specific measurement requirements on concessionary leases for lessees, whereas IFRS 16 does not.
- IPSAS 43 includes specific disclosure requirements on concessionary leases for both lessees and lessors, whereas IFRS 16 does not.

COMPARISON WITH GFS

In developing IPSAS 43, *Leases*, the IPSASB considered Government Finance Statistics (GFS) reporting guidelines.

Key similarities and differences with GFS are as follows:

- IPSAS 43 applies a right-of-use model for lessees and a risks and rewards model for lessors, while GFS applies a risks and rewards model for both lessees and lessors.
- Under IPSAS 43, lessors classify leases as finance lease or operating lease and lessees do not classify leases as finance lease or operating lease. Under GFS, leases are classified as financial lease, operating lease, or resource lease.
- Under IPSAS 43, lessees recognize a right-of use asset and a lease liability. Under GFS, an underlying asset and a loan are recognized in a financial lease and lease payments from operating leases are recognized as use of goods and services.
- IPSAS 43 provides an optional recognition exemption for lessees on short-term leases and leases for which the underlying asset is of low value. GFS does not provide such recognition exemption.
- IPSAS 43 includes specific measurement requirements on concessionary leases for lessees, whereas GFS does not.
- IPSAS 43 includes specific disclosure requirements on concessionary leases for both lessees and lessors, whereas GFS does not.

IPSAS 44, *NON-CURRENT ASSETS HELD FOR SALE AND DISCONTINUED OPERATIONS*

History of IPSAS Accounting Standard

This version includes amendments resulting from IPSAS Accounting Standards issued up to January 31, 2026.

IPSAS 44, *Non-current Assets Held for Sale and Discontinued Operations* was issued in May 2022.

Since then, IPSAS 44 has been amended by the following IPSAS Accounting Standards:

- IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards* (issued November 2025)
- IPSAS 47, *Revenue* (issued May 2023)
- IPSAS 45, *Property, Plant, and Equipment* (issued May 2023)

Table of Amended Paragraphs in IPSAS 44

Comparison with GFS	

International Public Sector Accounting Standard 44, *Non-current Assets Held for Sale and Discontinued Operations*, is set out in paragraphs 1–60. All the paragraphs have equal authority. IPSAS 44 should be read in the context of its objective, the Basis for Conclusions, the *Preface to International Public Sector Accounting Standards*, and *The Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities*. IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*, provides a basis for selecting and applying accounting policies in the absence of explicit guidance.

Objective

1. The objective of this Standard is to specify the accounting for assets held for sale, and the presentation and disclosure of discontinued operations. In particular, this Standard requires:

   (a) Assets that meet the criteria to be classified as held for sale to be measured at the lower of carrying amount and fair value less costs to sell, and depreciation on such assets to cease; and

   (b) Assets that meet the criteria to be classified as held for sale to be presented separately in the statement of financial position and the results of discontinued operations to be presented separately in the statement of financial performance.

Scope

2. **An entity that prepares and presents financial statements under the accrual basis of accounting shall apply this Standard in accounting for non-current assets held for sale, and the presentation and disclosure of discontinued operations.**

3. The classification and presentation requirements of this Standard apply to all recognized non-current assets[1] and to all disposal groups of an entity. The measurement requirements of this Standard apply to all recognized non-current assets and disposal groups (as set out in paragraph 5), except for those assets listed in paragraph 6 which shall continue to be measured in accordance with the Standard noted.

4. Assets classified as non-current in accordance with IPSAS 1, *Presentation of Financial* Statements shall not be reclassified as current assets until they meet the criteria to be classified as held for sale in accordance with this Standard. Assets of a class that an entity would normally regard as non-current that are acquired exclusively with a view to resale shall not be classified as current unless they meet the criteria to be classified as held for sale in accordance with this Standard.

5. Sometimes an entity disposes of a group of assets, possibly with some directly associated liabilities, together in a single transaction. Such a disposal group may be a group of cash-generating units, a single cash-generating unit, or part of a cash-generating unit[2]. The group may include any assets and any liabilities of the entity, including current assets, current liabilities and assets excluded by paragraph 6 from the measurement requirements of this Standard. If a non-current asset within the scope of the measurement requirements of this Standard is part of a disposal group, the measurement requirements of this Standard apply to the group as a whole, so that the group is measured at the lower of its carrying amount and fair value less costs to sell. The requirements for measuring the individual assets and liabilities within the disposal group are set out in paragraphs 26, 27 and 31.

6. The measurement provisions of this Standard[3] do not apply to the following assets, which are covered by the Standards listed, either as individual assets or as part of a disposal group:

   (a) Deferred tax assets within the scope of the relevant international or national accounting standard dealing with income taxes;

   (b) Assets arising from employee benefits (IPSAS 39, *Employee Benefits*);

   (c) Financial assets within the scope of IPSAS 41, *Financial Instruments*;

---

[1] For assets classified according to a liquidity presentation, non-current assets are assets that include amounts expected to be recovered more than twelve months after the reporting period. Paragraph 4 applies to the classification of such assets.

[2] However, once the cash flows from an asset or group of assets are expected to arise principally from sale rather than continuing use, they become less dependent on cash flows arising from other assets, and a disposal group that was part of a cash-generating unit becomes a separate cash-generating unit.

[3] Other than paragraphs 26 and 27, which require the assets in question to be measured in accordance with other applicable IPSAS.

(d) Non-current assets that are accounted for in accordance with the current value model in IPSAS 16, *Investment Property;*

(e) Non-current assets that are measured at fair value less costs to sell in accordance with IPSAS 27, *Agriculture*; and

(f) Groups of contracts within the scope of the relevant international or national accounting standard dealing with insurance contracts.

7. The classification, presentation and measurement requirements in this Standard applicable to a non-current asset (or disposal group) that is classified as held for sale apply also to a non-current asset (or disposal group) that is classified as held for distribution to owners acting in their capacity as owners (held for distribution to owners).

8. This Standard specifies the disclosures required in respect of non-current assets (or disposal groups) classified as held for sale or discontinued operations. Disclosures in other IPSAS do not apply to such assets (or disposal groups) unless those IPSAS require:

(a) Specific disclosures in respect of non-current assets (or disposal groups) classified as held for sale or discontinued operations; or

(b) Disclosures about measurement of assets and liabilities within a disposal group that are not within the scope of the measurement requirement of this Standard and such disclosures are not already provided in the other notes to the financial statements.

Additional disclosures about non-current assets (or disposal groups) classified as held for sale or discontinued operations may be necessary to comply with the general requirements of IPSAS 1, in particular paragraphs 27 and 140 of that Standard.

Definitions

9. **The following terms are used in this Standard with the meanings specified:**

A cash-generating unit is the smallest identifiable group of assets held with the primary objective of generating a commercial return that generates cash inflows from continuing use that are largely independent of the cash inflows from other assets or groups of assets.

A component of an entity comprises operations and cash flows that can be clearly distinguished, operationally and for financial reporting purposes, from the rest of the entity.

Costs to sell are the incremental costs directly attributable to the disposal of an asset (or disposal group), excluding finance costs and income tax expense.

An entity shall classify an asset as a current asset when:

(a) **It expects to realize the asset, or intends to sell or consume it, in its normal operating cycle;**

(b) **It holds the asset primarily for the purpose of trading;**

(c) **It expects to realize the asset within twelve months after the reporting period; or**

(d) **The asset is cash or a cash equivalent (as defined in IPSAS 2, *Cash Flow Statements*) unless the asset is restricted from being exchanged or used to settle a liability for at least twelve months after the reporting period.**

A discontinued operation is a component of an entity that either has been disposed of or is classified as held for sale and:

(a) **Represents a separate major operation or geographical area of operations;**

(b) **Is part of a single coordinated plan to dispose of a separate operation or geographical area of operations; or**

(c) **Is a controlled entity acquired exclusively with a view to resale.**

A disposal group is a group of assets to be disposed of, by sale or otherwise, together as a group in a single transaction, and liabilities directly associated with those assets that will be transferred in the transaction. The group includes goodwill acquired in a public sector combination if the group is a cash-generating unit to which goodwill has been allocated in accordance with the requirements of paragraphs 90A–90H of IPSAS 26, *Impairment of Cash-Generating Assets or* if it is an operation within such a cash-generating unit.

A firm purchase commitment is an agreement with an unrelated party, binding on both parties and usually legally enforceable, that (a) specifies all significant terms, including the price and timing of the transactions, and (b) includes a disincentive for non-performance that is sufficiently large to make performance highly probable.

Highly probable means significantly more likely than probable.

A non-current asset is an asset that does not meet the definition of a current asset.

Probable means more likely than not.

Recoverable amount is the higher of an asset's fair value less costs of disposal and its value in use.

Terms defined in other IPSAS are used in this Standard with the same meaning as in those Standards and are reproduced in the *Glossary of Defined Terms* published separately.

10. **The term 'fair value' is used in this Standard with the same meaning as in IPSAS 46, *Measurement*.**

Classification of Non-current Assets (or Disposal Groups) as Held for Sale or as Held for Distribution to Owners

11. **An entity shall classify a non-current asset (or disposal group) as held for sale if its carrying amount will be recovered principally through a sale transaction rather than through continuing use.**

12. For this to be the case, the asset (or disposal group) must be available for immediate sale in its present condition subject only to terms that are usual and customary for sales of such assets (or disposal groups) and its sale must be highly probable.

13. For the sale to be highly probable, the appropriate level of management must be committed to a plan to sell the asset (or disposal group), and an active program to locate a buyer and complete the plan must have been initiated. Further, the asset (or disposal group) must be actively marketed for sale at a price that is reasonable in relation to its current fair value. In addition, the sale should be expected to qualify for recognition as a completed sale within one year from the date of classification, except as permitted by paragraph 15, and actions required to complete the plan should indicate that it is unlikely that significant changes to the plan will be made or that the plan will be withdrawn. The probability of owners' approval[4] (if required in the jurisdiction) should be considered as part of the assessment of whether the sale is highly probable.

14. An entity that is committed to a sale plan involving loss of control of a controlled entity shall classify all the assets and liabilities of that controlled entity as held for sale when the criteria set out in paragraphs 11–13 are met, regardless of whether the entity will retain a non-controlling interest in its former controlled entity after the sale.

[4] In the public sector, obtaining regulatory approval to sell assets is common.

15. Events or circumstances may extend the period to complete the sale beyond one year. An extension of the period required to complete a sale does not preclude an asset (or disposal group) from being classified as held for sale if the delay is caused by events or circumstances beyond the entity's control and there is sufficient evidence that the entity remains committed to its plan to sell the asset (or disposal group). This will be the case when the criteria in Appendix A are met.

16. Sale transactions include exchanges of non-current assets for other non-current assets when the exchange has commercial substance in accordance with IPSAS 45, *Property, Plant, and Equipment.*

17. When an entity acquires a non-current asset (or disposal group) exclusively with a view to its subsequent disposal, it shall classify the non-current asset (or disposal group) as held for sale at the acquisition date only if the one-year requirement in paragraph 13 is met (except as permitted by paragraph 15) and it is highly probable that any other criteria in paragraphs 12 and 13 that are not met at that date will be met within a short period following the acquisition (usually within three months).

18. If the criteria in paragraphs 12 and 13 are met after the reporting period, an entity shall not classify a non-current asset (or disposal group) as held for sale in those financial statements when issued. However, when those criteria are met after the reporting period but before the authorization of the financial statements for issue, the entity shall disclose the information specified in paragraph 51(a), (b) and (d) in the notes.

19. A non-current asset (or disposal group) is classified as held for distribution to owners when the entity is committed to distribute the asset (or disposal group) to the owners. For this to be the case, the assets must be available for immediate distribution in their present condition and the distribution must be highly probable. For the distribution to be highly probable, actions to complete the distribution must have been initiated and should be expected to be completed within one year from the date of classification. Actions required to complete the distribution should indicate that it is unlikely that significant changes to the distribution will be made or that the distribution will be withdrawn. The probability of owners' approval (if required in the jurisdiction) should be considered as part of the assessment of whether the distribution is highly probable.

Non-current Assets that are to be Abandoned

20. An entity shall not classify as held for sale a non-current asset (or disposal group) that is to be abandoned. This is because its carrying amount will be recovered principally through continuing use. However, if the disposal group to be abandoned meets the criteria in paragraph 41(a)–(c), the entity shall present the results and cash flows of the disposal group as discontinued operations in accordance with paragraphs 42 and 43 at the date on which it ceases to be used. Non-current assets (or disposal groups) to be abandoned include non-current assets (or disposal groups) that are to be used to the end of their economic life and non-current assets (or disposal groups) that are to be closed rather than sold.

21. An entity shall not account for a non-current asset that has been temporarily taken out of use as if it had been abandoned.

Measurement of Non-current Assets (or Disposal Groups) Classified as Held for Sale

Measurement of a Non-current Asset (or Disposal Group)

22. **An entity shall measure a non-current asset (or disposal group) classified as held for sale at the lower of its carrying amount and fair value less costs to sell.**

23. **An entity shall measure a non-current asset (or disposal group) classified as held for distribution to owners at the lower of its carrying amount and fair value less costs to distribute.[5]**

[5] Costs to distribute are the incremental costs directly attributable to the distribution, excluding finance costs and income tax expense.

24. If a newly acquired asset (or disposal group) meets the criteria to be classified as held for sale (see paragraph 17), applying paragraph 22 will result in the asset (or disposal group) being measured on initial recognition at the lower of its carrying amount had it not been so classified (for example, cost) and fair value less costs to sell. Hence, if the asset (or disposal group) is acquired as part of a public sector acquisition (see IPSAS 40, *Public Sector Combinations*), it shall be measured at fair value less costs to sell. If the asset (or disposal group) is acquired as part of a public sector amalgamation (see IPSAS 40,), it shall be measured at the lower of its carrying amount and fair value less costs to sell.

25. When the sale is expected to occur beyond one year, the entity shall measure the costs to sell at their present value. Any increase in the present value of the costs to sell that arises from the passage of time shall be presented in surplus or deficit as a financing cost.

26. Immediately before the initial classification of the asset (or disposal group) as held for sale, the carrying amounts of the asset (or all the assets and liabilities in the group) shall be measured in accordance with applicable IPSAS.

27. On subsequent remeasurement of a disposal group, the carrying amounts of any assets and liabilities that are not within the scope of the measurement requirements of this Standard, but are included in a disposal group classified as held for sale, shall be remeasured in accordance with applicable IPSAS before the fair value less costs to sell of the disposal group is remeasured.

Recognition of Impairment Losses and Reversals

28. An entity shall recognize an impairment loss for any initial or subsequent write-down of the asset (or disposal group) to fair value less costs to sell, to the extent that it has not been recognized in accordance with paragraph 27.

29. An entity shall recognize a gain for any subsequent increase in fair value less costs to sell of an asset, but not in excess of the cumulative impairment loss that has been recognized either in accordance with this Standard or previously in accordance with IPSAS 21, *Impairment of Non-Cash-Generating Assets* or IPSAS 26, *Impairment of Cash-Generating Assets.*

30. An entity shall recognize a gain for any subsequent increase in fair value less costs to sell of a disposal group:

    (a) To the extent that it has not been recognized in accordance with paragraph 27; but

    (b) Not in excess of the cumulative impairment loss that has been recognized, either in accordance with this Standard or previously in accordance with IPSAS 21 or IPSAS 26, on the non-current assets that are within the scope of the measurement requirements of this Standard.

31. The impairment loss (or any subsequent gain) recognized for a disposal group shall reduce (or increase) the carrying amount of the non-current assets in the group that are within the scope of the measurement requirements of this Standard, in the order of allocation set out in paragraphs 91(a) and (b) and 110 of IPSAS 26.

32. A gain or loss not previously recognized by the date of the sale of a non-current asset (or disposal group) shall be recognized at the date of derecognition. Requirements relating to derecognition are set out in:

    (a) Paragraphs 62–68 of IPSAS 45 for property, plant, and equipment; and

    (b) Paragraphs 111–116 of IPSAS 31*, Intangible Assets*, for intangible assets.

33. An entity shall not depreciate (or amortize) a non-current asset while it is classified as held for sale or while it is part of a disposal group classified as held for sale. Interest and other expenses attributable to the liabilities of a disposal group classified as held for sale shall continue to be recognized.

Changes to a Plan of Sale or to a Plan of Distribution to Owners

34. If an entity has classified an asset (or disposal group) as held for sale or as held for distribution to owners, but the criteria in paragraphs 12–15 (for held for sale) or in paragraph 19 (for held for distribution to owners) are no longer met, the entity shall cease to classify the asset (or disposal group) as held for sale or held for distribution to owners (respectively). In such cases an entity shall follow the guidance in paragraphs 36–38 to account for this change except when paragraph 35 applies.

35. If an entity reclassifies an asset (or disposal group) directly from being held for sale to being held for distribution to owners, or directly from being held for distribution to owners to being held for sale, then the change in classification is considered a continuation of the original plan of disposal. The entity:

    (a) Shall not follow the guidance in paragraphs 36–38 to account for this change. The entity shall apply the classification, presentation and measurement requirements in this Standard that are applicable to the new method of disposal.

    (b) Shall measure the non-current asset (or disposal group) by following the requirements in paragraph 22 (if reclassified as held for sale) or 23 (if reclassified as held for distribution to owners) and recognize any reduction or increase in the fair value less costs to sell/costs to distribute of the non-current asset (or disposal group) by following the requirements in paragraphs 28–33.

    (c) Shall not change the date of classification in accordance with paragraphs 13 and 19. This does not preclude an extension of the period required to complete a sale or a distribution to owners if the conditions in paragraph 15 are met.

36. The entity shall measure a non-current asset (or disposal group) that ceases to be classified as held for sale or as held for distribution to owners (or ceases to be included in a disposal group classified as held for sale or as held for distribution to owners) at the lower of:

    (a) Its carrying amount before the asset (or disposal group) was classified as held for sale or as held for distribution to owners, adjusted for any depreciation, amortization or revaluations that would have been recognized had the asset (or disposal group) not been classified as held for sale or as held for distribution to owners; and

    (b) Its recoverable amount at the date of the subsequent decision not to sell or distribute.[6]

37. The entity shall include any required adjustment to the carrying amount of a non-current asset that ceases to be classified as held for sale or as held for distribution to owners in surplus or deficit[7] from continuing operations in the period in which the criteria in paragraphs 12–15 or 19, respectively, are no longer met. Financial statements for the periods since classification as held for sale or as held for distribution to owners shall be amended accordingly if the disposal group or non-current asset that ceases to be classified as held for sale or as held for distribution to owners is a controlled entity, joint operation, joint venture, associate, or a portion of an interest in a joint venture or an associate. The entity shall present that adjustment in the same caption in the statement of financial performance used to present a gain or loss, if any, recognized in accordance with paragraph 47.

38. If an entity removes an individual asset or liability from a disposal group classified as held for sale, the remaining assets and liabilities of the disposal group to be sold shall continue to be measured as a group only if the group meets the criteria in paragraphs 12–15. If an entity removes an individual asset or liability

[6] If the non-current asset is part of a cash-generating unit, its recoverable amount is the carrying amount that would have been recognized after the allocation of any impairment loss arising on that cash-generating unit in accordance with IPSAS 26.

[7] Unless the asset is property, plant, and equipment or an intangible asset that had been revalued in accordance with IPSAS 31 or IPSAS 45 before classification as held for sale, in which case the adjustment shall be treated as a revaluation increase or decrease.

from a disposal group classified as held for distribution to owners, the remaining assets and liabilities of the disposal group to be distributed shall continue to be measured as a group only if the group meets the criteria in paragraph 19. Otherwise, the remaining non-current assets of the group that individually meet the criteria to be classified as held for sale (or as held for distribution to owners) shall be measured individually at the lower of their carrying amounts and fair values less costs to sell (or costs to distribute) at that date. Any non-current assets that do not meet the criteria for held for sale shall cease to be classified as held for sale in accordance with paragraph 34. Any non-current assets that do not meet the criteria for held for distribution to owners shall cease to be classified as held for distribution to owners in accordance with paragraph 34.

Presentation and Disclosure

39. **An entity shall present and disclose information that enables users of the financial statements to evaluate the financial effects of discontinued operations and disposals of non-current assets (or disposal groups).**

Presenting Discontinued Operations

40. A component of an entity comprises operations and cash flows that can be clearly distinguished, operationally and for financial reporting purposes, from the rest of the entity. In other words, a component of an entity may have been a cash-generating unit or a group of cash-generating units while being held for use.

41. A discontinued operation is a component of an entity that either has been disposed of, or is classified as held for sale, and

    (a) Represents a separate major operation or geographical area of operations;

    (b) Is part of a single coordinated plan to dispose of a separate major operation or geographical area of operations; or

    (c) Is a controlled entity acquired exclusively with a view to resale.

42. An entity shall disclose:

    (a) A single amount in the statement of financial performance comprising the total of:

        (i) The post-tax surplus or deficit of discontinued operations; and

        (ii) The post-tax gain or loss recognized on the measurement to fair value less costs to sell or on the disposal of the assets or disposal group(s) constituting the discontinued operation.

    (b) An analysis of the single amount in (a) into:

        (i) The revenue, expenses and pre-tax surplus or deficit of discontinued operations;

        (ii) The related income tax expense as required by the relevant international or national accounting standard dealing with income taxes;

        (iii) The gain or loss recognized on the measurement to fair value less costs to sell or on the disposal of the assets or disposal group(s) constituting the discontinued operation; and

        (iv) The related income tax expense as required by the relevant international or national accounting standard dealing with income taxes.

    The analysis may be presented in the notes or in the statement of financial performance. If it is presented in the statement of financial performance, it shall be presented in a section identified as relating to discontinued operations, i.e., separately from continuing operations. The analysis is not required for disposal groups that are newly acquired controlled entities that meet the criteria to be classified as held for sale on acquisition (see paragraph 17).

(c) The net cash flows attributable to the operating, investing and financing activities of discontinued operations. These disclosures may be presented either in the notes or in the financial statements. These disclosures are not required for disposal groups that are newly acquired controlled entities that meet the criteria to be classified as held for sale on acquisition (see paragraph 17).

(d) The amount of revenue from continuing operations and from discontinued operations attributable to owners of the controlling entity. These disclosures may be presented either in the notes or in the statement of financial performance.

43. An entity shall re-present the disclosures in paragraph 42 for prior periods presented in the financial statements so that the disclosures relate to all operations that have been discontinued by the end of the reporting period for the latest period presented.

44. Adjustments in the current period to amounts previously presented in discontinued operations that are directly related to the disposal of a discontinued operation in a prior period shall be classified separately in discontinued operations. The nature and amount of such adjustments shall be disclosed. Examples of circumstances in which these adjustments may arise include the following:

(a) The resolution of uncertainties that arise from the terms of the disposal transaction, such as the resolution of purchase price adjustments and indemnification issues with the purchaser.

(b) The resolution of uncertainties that arise from and are directly related to the operations of the component before its disposal, such as environmental and product warranty obligations retained by the seller.

(c) The settlement of employee benefit plan obligations, provided that the settlement is directly related to the disposal transaction.

45. If an entity ceases to classify a component of an entity as held for sale, the results of operations of the component previously presented in discontinued operations in accordance with paragraphs 42–44 shall be reclassified and included in revenue from continuing operations for all periods presented. The amounts for prior periods shall be described as having been re-presented.

46. An entity that is committed to a sale plan involving loss of control of a controlled entity shall disclose the information required in paragraphs 42–45 when the controlled entity is a disposal group that meets the definition of a discontinued operation in accordance with paragraph 41.

Gains or Losses Relating to Continuing Operations

47. Any gain or loss on the remeasurement of a non-current asset (or disposal group) classified as held for sale that does not meet the definition of a discontinued operation shall be included in surplus or deficit from continuing operations.

Presentation of a Non-current Asset or Disposal Group Classified as Held for Sale

48. An entity shall present a non-current asset classified as held for sale and the assets of a disposal group classified as held for sale separately from other assets in the statement of financial position. The liabilities of a disposal group classified as held for sale shall be presented separately from other liabilities in the statement of financial position. Those assets and liabilities shall not be offset and presented as a single amount. The major classes of assets and liabilities classified as held for sale shall be separately disclosed either in the statement of financial position or in the notes, except as permitted by paragraph 49. An entity shall present separately any cumulative revenue or expense recognized in the statement of changes in net assets/equity relating to a non-current asset (or disposal group) classified as held for sale.

49. If the disposal group is a newly acquired controlled entity that meets the criteria to be classified as held for sale on acquisition (see paragraph 17), disclosure of the major classes of assets and liabilities is not required.

50. An entity shall not reclassify or re-present amounts presented for non-current assets or for the assets and liabilities of disposal groups classified as held for sale in the statements of financial position for prior periods to reflect the classification in the statement of financial position for the latest period presented.

Additional Disclosures

51. An entity shall disclose the following information in the notes in the period in which a non-current asset (or disposal group) has been either classified as held for sale or sold:

    (a) A description of the non-current asset (or disposal group);

    (b) A description of the facts and circumstances of the sale, or leading to the expected disposal, and the expected manner and timing of that disposal;

    (c) The gain or loss recognized in accordance with paragraphs 28–30 and, if not separately presented in the statement of financial performance, the caption in the statement of financial performance that includes that gain or loss; and

    (d) If applicable, the segment in which the non-current asset (or disposal group) is presented in accordance with IPSAS 18, *Segment Reporting.*

52. An entity shall disclose in the notes, the fair value of the non-current asset (or disposal group) classified as held for sale when that non-current asset (or disposal group) is measured at a materially lower carrying amount than fair value.

53. If either paragraph 34 or paragraph 38 applies, an entity shall disclose, in the period of the decision to change the plan to sell the non-current asset (or disposal group), a description of the facts and circumstances leading to the decision and the effect of the decision on the results of operations for the period and any prior periods presented.

Fair Value Disclosures

54. An entity shall disclose information that helps users of its financial statements assess, for assets and liabilities that are measured at fair value in the statement of financial position after initial recognition, the measurement techniques and inputs used to develop those measurements.

55. To meet the objectives in paragraph 54, an entity shall consider all the following:

    (a) The level of detail necessary to satisfy the disclosure requirements;

    (b) How much emphasis to place on each of the various requirements;

    (c) How much aggregation or disaggregation to undertake; and

    (d) Whether users of financial statements need additional information to evaluate the quantitative information disclosed.

    If the disclosures provided in accordance with this Standard and other IPSAS are insufficient to meet the objectives in paragraph 54, an entity shall disclose additional information necessary to meet those objectives.

56. To meet the objectives in paragraph 54, an entity shall disclose, at a minimum, the following information for each class of assets and liabilities measured at fair value (including measurements based on fair value within the scope of IPSAS 46), in the statement of financial position after initial recognition:

    (a) The fair value measurement at the end of the reporting period, and the reasons for the measurement.

(b) The level of the fair value hierarchy within which the fair value measurements are categorized in their entirety (Level 1, 2 or 3).

(c) For fair value measurements categorized within Level 2 and Level 3 of the fair value hierarchy, a description of the measurement technique(s) and the inputs used in the fair value measurement. If there has been a change in measurement technique (e.g., changing from a market approach to an income approach or the use of an additional measurement technique), the entity shall disclose that change and the reason(s) for making it. For fair value measurements categorized within Level 3 of the fair value hierarchy, an entity shall provide quantitative information about the significant unobservable inputs used in the fair value measurement. An entity is not required to create quantitative information to comply with this disclosure requirement if quantitative unobservable inputs are not developed by the entity when measuring fair value (e.g., when an entity uses prices from prior transactions or third-party pricing information without adjustment). However, when providing this disclosure an entity cannot ignore quantitative unobservable inputs that are significant to the fair value measurement and are reasonably available to the entity.

(d) For fair value measurements categorized within Level 3 of the fair value hierarchy, a description of the valuation processes used by the entity (including, for example, how an entity decides its valuation policies and procedures and analyses changes in fair value measurements from period to period).

(e) For fair value measurements, if the highest and best use of a non-financial asset differs from its current use, an entity shall disclose that fact and why the non-financial asset is being used in a manner that differs from its highest and best use.

57. For each class of assets and liabilities not measured at fair value in the statement of financial position but for which the fair value is disclosed, an entity shall disclose the information required by paragraphs 56(b), 56(c) and 56(e). However, an entity is not required to provide the quantitative disclosures about significant unobservable inputs used in fair value measurements categorized within Level 3 of the fair value hierarchy required by paragraph 56(c). For such assets and liabilities, an entity does not need to provide the other disclosures required by this Standard.

Effective Date and Transition

Effective Date

58. **An entity shall apply this Standard for annual financial statements beginning on or after January 1, 2025. Earlier application is permitted. If an entity applies this Standard for a period beginning before January 1, 2025, it shall disclose that fact and apply IPSAS 43 *Leases* at the same time.**

58A. **Paragraphs 16, 32, and 37 were amended by IPSAS 45 issued in May 2023. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2025. Earlier application is encouraged. If an entity applies these amendments for a period beginning before January 1, 2025, it shall disclose that fact and apply IPSAS 45 at the same time.**

59. When an entity adopts accrual basis IPSAS Standards as defined in IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards* for financial reporting purposes subsequent to this effective date, this Standard applies to the entity's annual financial statements covering periods beginning on or after the date of adoption of IPSAS Standards.

Transition

60. This Standard shall be applied prospectively to non-current assets (or disposal groups) that meet the criteria to be classified as held for sale and operations that meet the criteria to be classified as discontinued after the effective date of this Standard. An entity may apply the requirements of this Standard to all non-current assets

(or disposal groups) that meet the criteria to be classified as held for sale and operations that meet the criteria to be classified as discontinued after any date before the effective date of this Standard, provided the valuations and other information needed to apply this Standard were obtained at the time those criteria were originally met.

Appendix A

Application Guidance

This appendix is an integral part of IPSAS 44

Extension of the period required to complete a sale (paragraph15)

AG1. As noted in paragraph 15, an extension of the period required to complete a sale does not preclude an asset (or disposal group) from being classified as held for sale if the delay is caused by events or circumstances beyond the entity's control and there is sufficient evidence that the entity remains committed to its plan to sell the asset (or disposal group). An exception to the one-year requirement in paragraph 13 shall therefore apply in the following situations in which such events or circumstances arise:

(a) At the date an entity commits itself to a plan to sell a non-current asset (or disposal group) it reasonably expects that others (not a buyer) will impose conditions on the transfer of the asset (or disposal group) that will extend the period required to complete the sale, and:

(i) Actions necessary to respond to those conditions cannot be initiated until after a firm purchase commitment is obtained, and

(ii) A firm purchase commitment is highly probable within one year.

(b) An entity obtains a firm purchase commitment and, as a result, a buyer or others unexpectedly impose conditions on the transfer of a non-current asset (or disposal group) previously classified as held for sale that will extend the period required to complete the sale, and:

(i) Timely actions necessary to respond to the conditions have been taken; and

(ii) A favorable resolution of the delaying factors is expected.

(c) During the initial one-year period, circumstances arise that were previously considered unlikely and, as a result, a non-current asset (or disposal group) previously classified as held for sale is not sold by the end of that period, and:

(i) During the initial one-year period the entity took action necessary to respond to the change in circumstances;

(ii) The non-current asset (or disposal group) is being actively marketed at a price that is reasonable, given the change in circumstances; and

(iii) The criteria in paragraphs 12 and 13 are met.

Appendix B

Amendments to Other IPSAS

[Deleted]

Basis for Conclusions

This Basis for Conclusions accompanies, but is not part of, IPSAS 44.

Objective

BC1. This Basis for Conclusions summarizes the IPSASB's considerations in reaching the conclusions on IPSAS 44, *Non-current Assets Held for Sale and Discontinued Operations*. This Standard is based on IFRS 5, *Non-current Assets Held for Sale and Discontinued Operations* (including amendments up to March 2017) issued by the International Accounting Standards Board (IASB). The Basis for Conclusions outlines only those areas where IPSAS 44 departs from the requirements of IFRS 5.

Background

BC2. IFRS 5 was issued by the IASB in March 2004 and its objective is to specify the accounting for non-current assets held for sale, and the presentation and disclosure of discontinued operations. Prior to the issuance of this Standard there were no equivalent requirements in IPSAS for the accounting for non-current assets held for sale.

BC3. The IPSASB's *Strategy and Work Plan 2019-2023* identified a project to develop an IPSAS aligned with IFRS 5 as part of Theme B – 'Maintaining alignment with IFRS' which then led to the development of this Standard. The IPSASB approved the Project Brief for this Standard at the June 2020 IPSASB meeting.

BC4. The IPSASB considered whether the title of this Standard should differ from IFRS 5 but decided that there was no public sector reason to do so.

Scope

BC5. The IPSASB considered whether assets that are surplus to an entity's operational requirements, but where no decision as to their future (i.e., either sale, transfer, or scrap) has been taken, should be within the scope of this Standard. The IPSASB also considered whether non-current assets that are to be transferred, rather than sold, to another public sector entity should be within scope.

BC6. The IPSASB noted that this project is an IFRS alignment project. IFRS 5 is intended to apply only to non-current assets that will be sold. Specific criteria have to be met for non-current assets to be classified as held for sale. As a result of public consultation and other regulatory requirements, public sector asset disposals can take considerable periods of time. The IPSASB decided that while such assets may be surplus to operational needs for this extended period, they would not meet the criteria for classification as held for sale until compliance with the necessary consultation and other regulatory requirements have been met. Until the criteria have been met, such assets, and assets to be transferred to another public sector entity, would fall outside the scope of this Standard, and should be accounted for under the requirements of the relevant IPSAS.

BC7. When this Standard was issued, the IPSASB had also discussed whether disclosures requiring the carrying amount of surplus non-current assets or non-current assets that are to be transferred to other public sector entities should have been added to IPSAS 17, *Property, Plant, and Equipment* and IPSAS 31, *Intangible Assets*. The IPSASB had decided that, because these transactions were beyond the scope of IPSAS 44 (as noted above in BC6) and were not consequential amendments arising from this Standard, it was not appropriate to include a requirement for such disclosures in IPSAS 44. The IPSASB had also noted that IPSAS 17 encouraged disclosures for temporarily idle property, plant, and equipment, and property, plant, and equipment retired from active use that is not within the scope of IPSAS 44. In developing IPSAS 45, *Property, Plant, and Equipment*, the IPSASB noted that these principles are still applicable.

Definitions

BC8. The IPSASB decided to replace the IFRS 5 definition of a 'cash-generating unit' with the definition in IPSAS 26, *Impairment of Cash-Generating Assets* to maintain consistency of terminology within IPSAS.

Measurement

BC9. The IPSASB considered whether there was any public sector reason to depart from the measurement requirements in IFRS 5. These requirements are that non-current assets classified as held for sale are to be measured at the lower of carrying amount and fair value less costs to sell. The IPSASB discussed whether non-current assets classified as held for sale should only be measured at fair value because the purpose of holding such assets is for financial capacity. It was noted that when public sector assets that are non-cash-generating and are held for their operational capacity are to be sold, the purpose of holding these assets changes from operational capacity to financial capacity, and fair value provides the most relevant value.

BC10. However, the IPSASB noted that, in circumstances where assets are measured using the historical cost model and the carrying amount is lower than the fair value less costs to sell, an entity would need to recognize an increase in value either as revenue or as a gain on revaluation. The IPSASB concluded that such an increase in value did not meet the recognition criteria for revenue nor was recognition as a gain on revaluation appropriate under the historical cost model. Further, this situation would not be unique to the public sector and so there was no reason to depart from the measurement requirement of IFRS 5 for this Standard.

BC11. The IPSASB also considered whether the measurement requirements in IFRS 5 should be adapted so that non-current assets that are to be sold in a negotiated agreement at a value other than fair value (for policy reasons) should be measured at the lower of carrying amount and net selling price. The IPSASB noted that private sector entities also sell assets at amounts other than fair value, and so there is no public sector reason to depart from the requirements of IFRS 5.

BC12. The IPSASB noted that IFRS 5 requires assets acquired in a business combination that meet the criteria to be classified as held for sale to be measured at fair value less costs to sell. However, in a public sector combination, assets can be acquired through an acquisition or an amalgamation. Assets acquired through a public sector acquisition are measured on acquisition at fair value; therefore, if they meet the criteria to be classified as held for sale, they are measured at fair value less costs to sell. However, assets acquired in a public sector amalgamation are measured at the carrying amount. Under the IFRS 5 requirements, if these assets met the criteria to be held for sale, they would be measured at fair value less costs to sell, and hence there may be an increase in value. Therefore, the IPSASB amended the requirements for assets acquired through a public sector amalgamation that met the criteria to be classified as held for sale: these should be measured at the lower of carrying amount and fair value less costs to sell.

Cross-Reference to IFRS 13, Fair Value

BC13. The IPSASB decided to refer to IFRS 13, *Fair Value* instead of the relevant national or international accounting standard dealing with measurement, where appropriate. In reaching this decision, the IPSASB noted that these references will be updated when a new IPSAS on Measurement is issued. IPSAS 46, *Measurement* was issued in May 2023, and references to IFRS 13 were updated.

Disclosure

BC14. The IPSASB decided that in the public sector, transparency and accountability are important when an entity decides to sell non-current assets. Therefore, when an asset is classified as held for sale and measured at a carrying amount that is materially lower than fair value, disclosure of the asset's fair value in the notes to the financial statements provides users with information relevant for holding the entity accountable. The IPSASB also noted that this was consistent with advice from members of the IPSASB Consultative Advisory

Group that information which allows users to hold the entity accountable for decisions regarding sales of non-current assets is in the public interest.

Effective Date

BC15. The IPSASB decided that IPSAS 44 should have an effective date for annual financial statements covering periods beginning on or after January 1, 2025, which aligns with the effective date for IPSAS 43, *Leases*. Earlier application permitted, but IPSAS 43, *Leases,* would need to be applied at the same time.

IMPLEMENTATION GUIDANCE

Measuring and presenting controlled entities acquired with a view to resale and classified as held for sale	Example 13

Implementation Guidance

This guidance accompanies, but is not part of, IPSAS 44.

Availability for immediate sale (paragraph 12)

To qualify for classification as held for sale, a non-current asset (or disposal group) must be available for immediate sale in its present condition subject only to terms that are usual and customary for sales of such assets (or disposal groups) (paragraph 12). A non-current asset (or disposal group) is available for immediate sale if a government entity currently has the intention and ability to transfer the asset (or disposal group) to a buyer in its present condition. Examples 1–3 illustrate situations in which the criterion in paragraph 12 would or would not be met.

Example 1

A government entity is committed to a plan to sell its municipal building and has initiated actions to locate a buyer.

(a) The government entity intends to transfer the building to a buyer after it vacates the building. The time necessary to vacate the building is usual and customary for sales of such assets. The criterion in paragraph 12 would be met at the plan commitment date.

(b) The government entity will continue to use the building until construction of a new municipal building is completed. The government entity does not intend to transfer the existing building to a buyer until after construction of the new building is completed (and it vacates the existing building). The delay in the timing of the transfer of the existing building imposed by the government entity (seller) demonstrates that the building is not available for immediate sale. The criterion in paragraph 12 would not be met until construction of the new building is completed, even if a firm purchase commitment for the future transfer of the existing building is obtained earlier.

Example 2

A government entity is committed to a plan to sell a road repair operation and has initiated actions to locate a buyer. At the plan commitment date, there is a backlog of uncompleted government road repair orders.

(a) The government entity intends to sell the road repair operation with its existing government road repair orders. Any uncompleted government road repair orders at the sale date will be transferred to the buyer and the buyer will repair government roads on a contract basis. The transfer of uncompleted government road repair orders at the sale date will not affect the timing of the transfer of the facility. The criterion in paragraph 12 would be met at the plan commitment date.

(b) The government entity intends to sell the road repair operation, but without its existing road repair orders. The government entity does not intend to transfer the operation to a buyer until after the backlog of uncompleted government road repair orders are fulfilled. The delay in the timing of the transfer of the operation imposed by the government entity (seller) demonstrates that the operation is not available for immediate sale. The criterion in paragraph 12 would not be met until government road repair orders are completed, even if a firm purchase commitment for the future transfer of the operation were obtained earlier.

Example 3

A government entity seizes, due to the owner failing to pay taxes, a property comprising land and buildings that it intends to sell.

(a) The government entity does not intend to transfer the property to a buyer until after it completes renovations to increase the property's sales value. The delay in the timing of the transfer of the property imposed by the government entity (seller) demonstrates that the property is not available for immediate sale. The criterion in paragraph 12 would not be met until the renovations are completed.

(b) After the renovations are completed and the property is classified as held for sale but before a firm purchase commitment is obtained, the government entity becomes aware of environmental damage requiring remediation. The government entity still intends to sell the property. However, the government entity does not have the ability to transfer the property to a buyer until after the remediation is completed. The delay in the timing of the transfer of the property imposed by others before a firm purchase commitment is obtained demonstrates that the property is not available for immediate sale. The criterion in paragraph 12 would not continue to be met as the property is no longer available for immediate sale. The property would be reclassified as held and used in accordance with paragraph 34.

Completion of sale expected within one year (paragraph 13)

Example 4

To qualify for classification as held for sale, the sale of a non-current asset (or disposal group) must be highly probable (paragraph 12), and transfer of the asset (or disposal group) must be expected to qualify for recognition as a completed sale within one year (paragraph 13). That criterion would not be met if, for example:

(a) A government entity that supplies computer equipment to individual departmental agencies, holds obsolete equipment and it has not yet been determined whether the equipment will be sold to employees, transferred to another public sector entity at no cost or donated to a not-for-profit entity.

(b) A government entity is committed to a plan to 'sell' a property that is in use as part of a sale and leaseback transaction, but the transfer does not qualify to be accounted for as a sale in accordance with paragraph 98 of IPSAS 43, *Leases* and, instead, will be accounted for in accordance with paragraph 102 of IPSAS 43.

Exceptions to the criterion that the sale should be expected to be completed in one year (paragraphs 13 and AG1)

An exception to the one-year requirement in paragraph 13 applies in limited situations in which the period required to complete the sale of a non-current asset (or disposal group) will be (or has been) extended by events or circumstances beyond an entity's control and specified conditions are met (paragraphs 15 and AG1). Examples 5–7 illustrate those situations.

Example 5

A government entity in the power generating industry is committed to a plan to sell a disposal group that represents a significant portion of its regulated operations. The sale requires prospective buyers to obtain regulatory approval, which could extend the period required to complete the sale beyond one year. Actions necessary to obtain that approval cannot be initiated until after a buyer is known and a firm purchase commitment is obtained. However, a firm purchase commitment is highly probable within one year. In that situation, the conditions in paragraph AG1(a) for an exception to the one-year requirement in paragraph 13 would be met.

Example 6

A government entity is committed to a plan to sell a government manufacturing facility in its present condition and classifies the facility as held for sale at that date. After a firm purchase commitment is obtained, the buyer's inspection of the property identifies environmental damage not previously known to exist. The government entity is required by the buyer to make good the damage, which will extend the period required to complete the sale beyond one year. However, the government entity has initiated actions to make good the damage, and satisfactory rectification of the damage is highly probable. In that situation, the conditions in paragraph AG1(b) for an exception to the one-year requirement in paragraph 13 would be met.

Example 7

A government entity is committed to a plan to sell a non-current asset and classifies the asset as held for sale at that date.

(a) During the initial one-year period, the market conditions that existed at the date the asset was classified initially as held for sale deteriorate and, as a result, the asset is not sold by the end of that period. During that period, the government entity actively solicited but did not receive any reasonable offers to purchase the asset and, in response, reduced the price. The asset continues to be actively marketed at a price that is reasonable given the change in market conditions, and the criteria in paragraphs 12 and 13 are therefore met. In that situation, the conditions in paragraph AG1(c) for an exception to the one-year requirement in paragraph 13 would be met. At the end of the initial one-year period, the asset would continue to be classified as held for sale.

(b) During the following one-year period, market conditions deteriorate further, and the asset is not sold by the end of that period. The government entity believes that the market conditions will improve and has not further reduced the price of the asset. The asset continues to be held for sale, but at a price in excess of its current fair value. In that situation, the absence of a price reduction demonstrates that the asset is not available for immediate sale as required by paragraph 12. In addition, paragraph 13 also requires an asset to be marketed at a price that is reasonable in relation to its current fair value. Therefore, the conditions in paragraph AG1(c) for an exception to the one-year requirement in paragraph 13 would not be met. The asset would be reclassified as held and used in accordance with paragraph 34.

Determining whether an asset has been abandoned (paragraph 20 and 21)

Paragraphs 20 and 21 of this Standard specify requirements for when assets are to be treated as abandoned. Example 8 illustrates when an asset has not been abandoned.

Example 8

A government entity ceases to use a storage facility because demand for storage has declined. However, the storage facility is maintained in workable condition, and it is expected that it will be brought back into use if demand picks up. The storage facility is not regarded as abandoned.

Presenting a discontinued operation that has been abandoned (paragraph 20)

Paragraph 20 of this Standard prohibits assets that will be abandoned from being classified as held for sale. However, if the assets to be abandoned are a major operation or geographical area of operations, they are reported in discontinued operations at the date at which they are abandoned. Example 9 illustrates this.

Example 9

In October 20X5 a government entity decides to abandon all its ammunition manufacturing facilities, which constitutes a major operation. All work stops at the ammunition manufacturing facilities during the year ended 31 December 20X6. In the financial statements for the year ended 31 December 20X5, results and cash flows of the ammunition manufacturing facilities are treated as continuing operations. In the financial statements for the year ended 31 December 20X6, the results and cash flows of the ammunition manufacturing facilities are treated as discontinued operations and the government entity makes the disclosures required by paragraphs 42 and 43 of this Standard.

Allocation of an impairment loss on a disposal group (paragraph 31)

Paragraph 31 of this Standard requires an impairment loss (or any subsequent gain) recognized for a disposal group to reduce (or increase) the carrying amount of the non-current assets in the group that are within the scope of the

measurement requirements of this Standard, in the order of allocation set out in paragraphs 91 and 110 of IPSAS 26. Example 10 illustrates the allocation of an impairment loss on a disposal group.

Example 10

A government entity plans to dispose of a group of its assets (as an asset sale). The assets form a disposal group, and are measured as follows:

	Carrying amount at the end of the reporting period before classification as held for sale	**Carrying amount as remeasured immediately before classification as held for sale**
	CU[(a)]	**CU**
Goodwill	1,500	1,500
Property, plant, and equipment (carried at revalued amounts)	4,600	4,000
Property, plant, and equipment (carried at cost)	5,700	5,700
Inventory	2,400	2,200
Investments in equity instruments	1,800	1,500
Total	**16,000**	**14,900**

(a) In this guidance, monetary amounts are denominated in 'currency units (CU)'.

The government entity recognizes the loss of CU1,100 (CU16,000 – CU14,900) immediately before classifying the disposal group as held for sale.

The government entity measures the fair value less costs to sell of the disposal group as CU13,000. Because a government entity measures a disposal group classified as held for sale at the lower of its carrying amount and fair value less costs to sell, the government entity recognizes an impairment loss of CU1,900 (CU14,900 – CU13,000) when the group is initially classified as held for sale.

The impairment loss is allocated to non-current assets to which the measurement requirements of this Standard are applicable. Therefore, no impairment loss is allocated to inventories and investments in equity instruments. The loss is allocated to the other assets in the order of allocation set out in paragraphs 91 and 110 of IPSAS 26.

The allocation can be illustrated as follows:

	Carrying amount as remeasured immediately before classification as held for sale	**Allocated impairment loss**	**Carrying amount after allocation of impairment loss**
	CU	**CU**	**CU**
Goodwill	1,500	(1,500)	0

	Carrying amount as remeasured immediately before classification as held for sale	Allocated impairment loss	Carrying amount after allocation of impairment loss
	CU	**CU**	**CU**
Property, plant, and equipment (carried at revalued amounts)	4,000	(165)	3,835
Property, plant, and equipment (carried at cost)	5,700	(235)	5,465
Inventories	2,200	–	2,200
Investments in equity instruments	1,500	–	1,500
Total	**14,900**	**(1,900)**	**13,000**

First, the impairment loss reduces any amount of goodwill. Then, the residual loss is allocated to other assets pro rata based on the carrying amounts of those assets.

Presenting discontinued operations in the statement of financial performance (paragraph 42)

Paragraph 42 of this Standard requires an entity to disclose a single amount in the statement of financial performance for discontinued operations with an analysis in the notes or in a section of the statement of financial performance separate from continuing operations. Example 11 illustrates how these requirements might be met.

Example 11

XYZ GOVERNMENT ENTITY – STATEMENT OF FINANCIAL PERFORMANCE FOR THE YEAR ENDED 31 DECEMBER 20X2 (illustrating the classification of expenses by function)

(in thousands of currency units)	**20X2**	**20X1**
Continuing operations		
Revenue		
Taxes	X	X
Other compulsory contributions and levies	X	X
Transfers without a binding arrangement	X	X
Revenue from compliance obligations in a binding arrangement	X	X
Other revenue	X	X
Total revenue	X	X
Expenses		
General public services	(X)	(X)
Defense	(X)	(X)
Public order and safety	(X)	(X)

Education	(X)	(X)
Health	(X)	(X)
Social benefits	(X)	(X)
Other social protection	(X)	(X)
Housing and community amenities	(X)	(X)
Recreational, cultural, and religion	(X)	(X)
Economic affairs	(X)	(X)
Environmental protection	(X)	(X)
Other expenses	(X)	(X)
Finance costs	(X)	(X)
Total expenses	**(X)**	**(X)**
Share of surplus of associates*	X	X
-		
Surplus/(deficit) for the period from continuing operations	X	X
Discontinued operations		
Surplus for the period from discontinued operations[(a)]	X	X
Surplus for the period	X	X
Attributable to:		
Owners of the controlling entity		
Surplus for the period from continuing operations	X	X
Surplus for the period from discontinued operations	X	X
Surplus for the period attributable to owners of the controlling entity	X	X
Non-controlling interests		
Surplus for the period from continuing operations	X	X
Surplus for the period from discontinued operations	X	X
Surplus for the period attributable to non-controlling interests	X	X
	X	X

* This means the share of associates' surplus attributable to owners of the associates, i.e., it is after tax and non-controlling interests in the associates.

(a) The required analysis would be given in the notes.

Presenting non-current assets or disposal groups classified as held for sale (paragraph 48)

Paragraph 48 of this Standard requires an entity to present a non-current asset classified as held for sale and the assets of a disposal group classified as held for sale separately from other assets in the statement of financial position. The liabilities of a disposal group classified as held for sale are also presented separately from other liabilities in the statement of financial position. Those assets and liabilities are not offset and presented as a single amount. Example 12 illustrates these requirements.

Example 12

At the end of 20X5, a government entity decides to dispose of part of its assets (and directly associated liabilities). The disposal, which meets the criteria in paragraphs 12 and 13 to be classified as held for sale, takes the form of two disposal groups, as follows:

	Carrying amount after classification as held for sale	
	Disposal group I: CU	Disposal group II: CU
Property, plant, and equipment	4,900	1,700
Investments in equity instruments	1,400[(a)]	–
Liabilities	(2,400)	(900)
Net carrying amount of disposal group	**3,900**	800

The presentation in the government entity's statement of financial position of the disposal groups classified as held for sale can be shown as follows:

(a) An amount of CU400 relating to these assets has been recognized in the statement of changes in net assets/equity and accumulated in net assets/equity.

	20X5	**20X4**
ASSETS		
Non-current assets		
AAA	X	X
BBB	X	X
CCC	X	X
	X	X
Current assets		
DDD	X	X
EEE	X	X
	X	X
Non-current assets classified as held for sale	8,000	–

	20X5	20X4
	X	X
Total assets	X	X
NET ASSETS/EQUITY AND LIABILITIES		
Net Assets/Equity attributable to owners of the controlling entity		
FFF	X	X
GGG	X	X
Amounts recognized in statement of changes in net assets/equity and accumulated in net assets/equity relating to non-current assets held for sale	400	–
	X	X
Non-controlling interests	X	X
Total net assets/equity	X	X
Non-current liabilities		
HHH	X	X
III	X	X
JJJ	X	X
	X	X
Current liabilities		
KKK	X	X
LLL	X	X
MMM	X	X
Liabilities directly associated with non-current assets classified as held for sale	3,300	–
	X	X
Total liabilities	X	X
Total net assets/equity and liabilities	X	X

The presentation requirements for assets (or disposal groups) classified as held for sale at the end of the reporting period do not apply retrospectively. The comparative statements of financial position for any previous periods are therefore not re-presented.

Measuring and presenting controlled entities acquired with a view to resale and classified as held for sale (paragraph 17)

A controlled entity acquired with a view to sale is not exempt from consolidation in accordance with IPSAS 35, *Consolidated Financial Statements*, unless the acquirer is an investment entity, as defined in IPSAS 35, and is required to measure the investment in that controlled entity at fair value through surplus or deficit. However, if it meets the criteria in paragraph 17, it is presented as a disposal group classified as held for sale. Example 13 illustrates these requirements.

Example 13

Government entity A acquires an entity H, which is a controlling entity with two controlled entities, CE1 and CE2. CE2 is acquired exclusively with a view to sale and meets the criteria to be classified as held for sale. In accordance with paragraph 41(c), CE2 is also a discontinued operation.

The fair value less costs to sell of CE2 is CU135. Government entity A accounts for CE2 as follows:

- Initially, government entity A measures the identifiable liabilities of CE2 at fair value, say at CU40
- Initially, government entity A measures the acquired assets as the fair value less costs to sell of CE2 (CU135) plus the fair value of the identifiable liabilities (CU40), i.e., at CU175
- At the end of the reporting period, government entity A remeasures the disposal group at the lower of its cost and fair value less costs to sell, say at CU130. The liabilities are remeasured in accordance with applicable IPSAS, say at CU35. The total assets are measured at CU130 + CU35, i.e., at CU165
- At the end of the reporting period, government entity A presents the assets and liabilities separately from other assets and liabilities in its consolidated financial statements as illustrated in Example 12 *Presenting non-current assets or disposal groups classified as held for sale*, and
- In the statement of financial performance, government entity A presents the total of the post-tax surplus or deficit of CE2 and the post-tax gain or loss recognized on the subsequent remeasurement of CE2, which equals the remeasurement of the disposal group from CU135 to CU130.

Further analysis of the assets and liabilities or of the change in value of the disposal group is not required.

COMPARISON WITH IFRS 5

IPSAS 44, *Non-current Assets Held for Sale and Discontinued Operations* is drawn primarily from IFRS 5, *Non-current Assets Held for Sale and Discontinued Operations* (issued in 2004, including amendments made up to May 2017).

The main difference between IPSAS 44 and IFRS 5 are as follows:

- IPSAS 44 requires disclosure in the notes of the fair value of a non-current asset (or disposal group) classified as held for sale if fair value is materially different to the carrying amount;
- IPSAS 44 replaces the IFRS 5 definition of a cash-generating unit with the definition of a cash-generating unit defined in IPSAS 26, *Impairment of Cash-Generating Assets*;
- IPSAS 44, acknowledges that public sector combinations differ from business combinations and can be either an acquisition or an amalgamation. Therefore, IPSAS 44 requires assets acquired in a public sector amalgamation that are to immediately be classified as held for sale to be measured at the lower of carrying amount and fair value less costs to sell; and
- IPSAS 44 uses different terminology in certain instances from IFRS 5. The most significant examples are the use of the terms “operation”, “public sector combination”, “revenue”, “owner”, “controlling entity” and “controlled entity”. The equivalent terms in IFRS 5 are “business”, “business combination”, “income”, “shareholder”, “parent” and “subsidiary”.

COMPARISON WITH GFS

In developing IPSAS 44, *Non-current Assets Held for Sale and Discontinued Operations*, the IPSASB considered Government Finance Statistics (GFS) reporting guidelines.

Key similarities and differences with GFS are as follows:

- GFS uses market value as the general valuation approach for all assets. Under IPSAS 44, a non-current asset (or disposal group) classified as held for sale is measured at the lower of its carrying amount and fair value less costs to sell. Market value can be used as a technique for estimating fair value under IPSAS.
- Under IPSAS 44, a non-current asset (or disposal group) is classified as held for sale when it is available for immediate sale in its present condition, and its sale is highly probable, subject only to terms that are usual for sales of such assets (or disposal groups). GFS does not have this type of classification.
- IPSAS 44 includes disclosure requirements that are not present in GFS.

IPSAS 45, *PROPERTY, PLANT, AND EQUIPMENT*

History of IPSAS Accounting Standard

This version includes amendments resulting from IPSAS Accounting Standards issued up to January 31, 2026.

IPSAS 45, *Property, Plant, and Equipment* was issued in May 2023.

Since then, IPSAS 45 has been amended by the following IPSAS Accounting Standards:

- IPSAS 51, *Tangible Natural Resources Held for Conservation* (issued January 2026)
- IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards* (issued November 2025)
- *Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* (issued August 2025)
- *Definition of Material* (Amendments to IPSAS 1, IPSAS 3, and the Conceptual Framework) (issued October 2025)
- *Amendments to IPSAS Standards: Specific IFRIC Interpretations* (issued January 2025)
- IPSAS 50, *Exploration for and Evaluation of Mineral Resources* (issued November 2024)
- IPSAS 47, *Revenue* (issued May 2023)

Table of Amended Paragraphs in IPSAS 45

Comparison with IAS 16	
Comparison with GFS	

International Public Sector Accounting Standard 45, *Property, Plant, and Equipment*, is set out in paragraphs 1–89. All the paragraphs have equal authority. IPSAS 45 should be read in the context of its objective, the Basis for Conclusions, the *Preface to IPSAS Accounting Standards and IPSASB SRS Standards*, and *The Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities*. IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*, provides a basis for selecting and applying accounting policies in the absence of explicit guidance.

Objective

1. The objective of this Standard is to prescribe the accounting treatment for property, plant, and equipment so that users of financial statements can discern information about an entity's investment in its property, plant, and equipment and the changes in such investment. The principal issues in accounting for property, plant, and equipment are the recognition of the assets, the determination of their carrying amounts, and the depreciation charges and impairment losses to be recognized in relation to them.

Scope (see paragraphs AG1-AG7)

2. **An entity that prepares and presents financial statements under the accrual basis of accounting shall apply this Standard in accounting for property, plant, and equipment, except when another Standard requires or permits a different accounting treatment.**

3. This Standard does not apply to:

   (a) Biological assets related to agricultural activity other than bearer plants (see IPSAS 27, *Agriculture*). This Standard applies to bearer plants but does not apply to the produce on bearer plants;

   (b) Mineral rights and mineral reserves such as oil, natural gas, and similar non-regenerative resources (see the relevant international or national accounting standard dealing with mineral rights, mineral reserves, and similar non-regenerative resources);

   (c) Property, plant, and equipment classified as held for sale in accordance with IPSAS 44, *Non-current Assets Held for Sale and Discontinued Operations*;

   (d) The recognition and measurement of exploration and evaluation assets (see IPSAS 50, *Exploration for and Evaluation of Mineral Resources*); and

   (e) Tangible natural resources held for conservation within the scope of IPSAS 51, *Tangible Natural Resources Held for Conservation*.

   However, this Standard applies to property, plant, and equipment used to develop or maintain the assets described in 3(a), 3(b) and 3(d).

4. An entity using the historical cost model for investment property in accordance with IPSAS 16, *Investment Property* shall use the historical cost model in this Standard for owned investment property.

Definitions (see paragraphs AG8-AG11)

5. **The following terms are used in this Standard with the meanings specified:**

   Carrying amount (for the purpose of this Standard) is the amount at which an asset is recognized after deducting any accumulated depreciation and accumulated impairment losses.

   Class of property, plant, and equipment means a grouping of assets of a similar nature or function in an entity's operations that is shown as a single item for the purpose of disclosure in the financial statements.

   Depreciable amount is the cost of an asset, or other amount substituted for cost, less its residual value.

   Depreciation is the systematic allocation of the depreciable amount of an asset over its useful life.

   Property, plant, and equipment are tangible assets that:

   (a) **Are held for use in the production or supply of goods or services, for rental to others, or for administrative purposes; and**

(b) **Are expected to be used during more than one reporting period.**

The residual value of an asset is the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal, if the asset were already of the age and in the condition expected at the end of its useful life.

Useful life is:

(a) **The period over which an asset is expected to be available for use by an entity; or**

(b) **The number of production or similar units expected to be obtained from the asset by an entity.**

Terms defined in other IPSAS are used in this Standard with the same meaning as in those Standards and are reproduced in the *Glossary of Defined Terms* published separately.

The following terms are defined and are used in this Standard with the same meaning as in IPSAS 46, *Measurement*:

(a) **Historical cost;**

(b) **Current operational value; and**

(c) **Fair value.**

The term recoverable service amount is defined in IPSAS 21, *Impairment of Non-Cash-Generating Assets* and is used in this Standard with the same meaning as in IPSAS 21.

The term recoverable amount is defined in IPSAS 26, *Impairment of Cash-Generating-Assets* and is used in this Standard with the same meaning as in IPSAS 26.

The term bearer plant is defined in IPSAS 27 and is used in this Standard with the same meaning as in IPSAS 27.

Recognition (see paragraphs AG12-AG16)

6. **An item of property, plant, and equipment shall be recognized if, and only if:**

   (a) **It is probable that future economic benefits or service potential associated with the item will flow to the entity; and**

   (b) **The item can be measured reliably**[1]**.**

7. If an entity holds heritage property, plant, and equipment that meets the definition of an asset, but which does not meet the recognition criteria in paragraph (b), information as required by paragraph 77 shall be disclosed in the notes to the financial statements. When information about the cost or current value of the heritage property, plant, and equipment becomes available, the entity shall, from that date, recognize the heritage property, plant, and equipment in accordance with paragraph 6 and apply the measurement principles in this Standard.

8. This Standard does not prescribe the unit of measure for recognition, i.e., what constitutes an item of property, plant, and equipment. Thus, judgment is required in applying the recognition criteria to an entity's specific circumstances. It may be appropriate to (a) disaggregate individually significant items, such as floors of a building, into separate units of account when the objective for which the entity holds the building is both for operational and financial capacity or (b) aggregate individually insignificant items, such as library books, computer peripherals, and small items of equipment, and to apply the criteria to the aggregate value.

[1] Information that is reliable is free from material error and bias, and can be depended on by users to faithfully represent that which it purports to represent or could reasonably be expected to represent. Paragraph BC16 of IPSAS 1, Presentation of Financial Statements discusses the transitional approach to the explanation of reliability.

9. An entity evaluates under this recognition principle all its property, plant, and equipment costs at the time they are incurred. These costs include costs incurred initially to acquire, construct or develop an item of property, plant, and equipment and costs incurred subsequently to add to, replace part of, or service it. The cost of an item of property, plant, and equipment may include costs incurred relating to leases of assets that are used to construct, add to, replace part of or service an item of property, plant, and equipment, such as depreciation of right-of-use assets.

10. Items of property, plant, and equipment may be required for safety or environmental reasons. The acquisition, construction, or development of such property, plant, and equipment, although not directly increasing the future economic benefits or service potential of any particular existing item of property, plant, and equipment, may be necessary for an entity to obtain the future economic benefits or service potential from its other assets. Such items of property, plant, and equipment qualify for recognition as assets, because they enable an entity to derive future economic benefits or service potential from related assets in excess of what could be derived had those items not been acquired, constructed, or developed. For example, fire safety regulations may require a hospital to retrofit new sprinkler systems. These enhancements are recognized because, without them, the entity is unable to operate the hospital in accordance with the regulations. However, the resulting carrying amount of such an asset and related assets is reviewed for impairment in accordance with IPSAS 21 and IPSAS 26.

Initial Measurement (see paragraphs AG17-AG19)

11. **An item of property, plant, and equipment that qualifies for recognition shall be measured at its cost, as described in paragraphs 14-19, unless it is acquired through a non-exchange transaction.**

12. **Property, plant, and equipment acquired through a non-exchange transaction shall be measured at its deemed cost. An entity shall apply IPSAS 46 when measuring deemed cost of an item of property, plant, and equipment.**

13. For the purposes of this Standard, the measurement at recognition of an item of property, plant, and equipment, acquired at no or nominal cost, at its deemed cost consistent with the requirements of paragraph 12, does not constitute a revaluation. Accordingly, the revaluation requirements in paragraph 29, and the supporting Application Guidance, only apply where an entity elects to revalue an item of property, plant, and equipment in subsequent reporting periods.

Elements of Cost

14. The cost of an item of property, plant, and equipment comprises:

    (a) Its purchase price, including import duties and non-refundable purchase taxes, after deducting trade discounts and rebates;

    (b) Any costs directly attributable to bringing the asset to the location and condition necessary for it to be capable of operating in the manner intended by management; and

    (c) The initial estimate of the costs of dismantling and removing the item and restoring the site on which it is located, the obligation for which an entity incurs either when the item is acquired, or as a consequence of having used the item during a particular period for purposes other than to produce inventories during that period.

15. Examples of directly attributable costs are:

    (a) Costs of employee benefits (as defined in IPSAS 39, *Employee Benefits*) arising directly from the acquisition, construction, or development of the item of property, plant, and equipment;

    (b) Costs of site preparation;

(c) Initial delivery and handling costs;

(d) Installation and assembly costs;

(e) Costs of testing whether the asset is functioning properly (i.e., assessing whether the technical and physical performance of the asset is such that it is capable of being used in the production or supply of goods or services, for rental to others, or for administrative purposes); and

(f) Professional fees.

16. An entity applies IPSAS 12, *Inventories*, to the costs of obligations for dismantling, removing, and restoring the site on which an item is located that are incurred during a particular period as a consequence of having used the item to produce inventories during that period. The obligations for costs accounted for in accordance with IPSAS 12 and this Standard are recognized and measured in accordance with IPSAS 19, *Provisions, Contingent Liabilities and Contingent Assets*.

17. Recognition of costs in the carrying amount of an item of property, plant, and equipment ceases when the item is in the location and condition necessary for it to be capable of operating in the manner intended by management. Therefore, costs incurred in using or redeploying an item are not included in the carrying amount of that item. For example, the following costs are not included in the carrying amount of an item of property, plant, and equipment:

(a) Costs incurred while an item capable of operating in the manner intended by management has yet to be brought into use or is operated at less than full capacity;

(b) Initial operating losses, such as those incurred while demand for the item's output builds up; and

(c) Costs of relocating or reorganizing part or all of the entity's operations.

18. Items may be produced while bringing an item of property, plant, and equipment to the location and condition necessary for it to be capable of operating in the manner intended by management (such as samples produced when testing whether the asset is functioning properly). An entity recognizes the proceeds from selling any such items, and the cost of those items, in surplus or deficit in accordance with applicable Standards. The entity measures the cost of those items applying the measurement requirements of IPSAS 12.

19. Some operations occur in connection with the construction or development of an item of property, plant, and equipment, but are not necessary to bring the item to the location and condition necessary for it to be capable of operating in the manner intended by management. These incidental operations may occur before or during the construction or development activities. For example, revenue may be earned through using a building site as a car park until construction starts. Because incidental operations are not necessary to bring an item to the location and condition necessary for it to be capable of operating in the manner intended by management, the revenue and related expenses of incidental operations are recognized in surplus or deficit, and included in their respective classifications of revenue and expense.

Measurement of Cost

20. The cost of an item of property, plant, and equipment is the cash price equivalent or, for an item referred to in paragraph 12, its deemed cost at the recognition date. If payment is deferred and the time value of money is material, the difference between the cash price equivalent and the total payment is recognized as interest over the period of credit, unless such interest is recognized in the carrying amount of the item in accordance with the allowed alternative treatment in IPSAS 5, *Borrowing Costs*.

21. One or more items of property, plant, and equipment may be acquired in exchange for a non-monetary asset or assets, or a combination of monetary and non-monetary assets. The following discussion refers simply to

an exchange of one non-monetary asset for another, but it also applies to all exchanges described in the preceding sentence. The cost of such an item of property, plant, and equipment is measured at its current value unless the exchange transaction lacks commercial substance, or the current value of neither the asset received nor the asset given up is reliably measurable. The acquired item is measured in this way even if an entity cannot immediately derecognize the asset given up. If the acquired item is not measured at current value, its cost is measured at the carrying amount of the asset given up.

22. An entity determines whether an exchange transaction has commercial substance by considering the extent to which its future cash flows or service potential is expected to change as a result of the transaction. An exchange transaction has commercial substance if:

    (a) The configuration (risk, timing, and amount) of the cash flows or service potential of the asset received differs from the configuration of the cash flows or service potential of the asset transferred; or

    (b) The portion of the entity's operations affected by the transaction changes as a result of the exchange; and

    (c) The difference in (a) or (b) is significant relative to the current value of the assets exchanged.

    For the purpose of determining the portion of the entity's operations affected by the transaction, as in paragraph 22(b), the entity calculates the present value of the expected cash flows, (or post-tax cash flows when tax applies), to arise from the continuing use of an asset and from its disposal at the end of its useful life. The result of these analyses may be clear without an entity having to perform detailed calculations.

23. The current value of an asset is reliably measurable if the variability in the range of reasonable current value measurements is not significant for that asset, or the probabilities of the various estimates within the range can be reasonably assessed and used when measuring current value. If an entity is able to measure reliably the current value of either the asset received or the asset given up, then the current value of the asset given up is used to measure the cost of the asset received unless the current value of the asset received is more clearly evident.

Subsequent Measurement (see paragraphs AG20-AG36)

24. **An entity shall choose either the historical cost model in paragraph 26 or the current value model in paragraph 27 as its accounting policy and shall apply that policy to an entire class of property, plant, and equipment.**

25. **When the measurement requirements are applied to the item of property, plant, and equipment after recognition, an entity shall apply IPSAS 46. If an entity's initial measurement of an item of property, plant, and equipment included an initial estimate of the cost of dismantling and removing the item and restoring the site under paragraph 14(c), for which it recognized a corresponding liability in accordance with IPSAS 19, *Provisions, Contingent Liabilities and Contingent Assets*, the entity shall also apply Appendix B of IPSAS 19 in its subsequent measurement of the item.**

Historical Cost Model

26. **After recognition, an item of property, plant, and equipment shall be carried at its historical cost, less any accumulated depreciation and any accumulated impairment losses.**

Current Value Model (see paragraphs AG20-AG23)

27. **After recognition, an item or part of an item of property, plant, and equipment whose current value can be measured reliably shall be carried at a revalued amount, being its current operational value or fair value at the date of the revaluation, less any subsequent accumulated depreciation, and subsequent accumulated impairment losses. The primary objective for which an entity holds an item**

or part of an item of property, plant, and equipment determines the current value measurement basis. An item or part of an item of property, plant, and equipment held primarily for its operational capacity is measured at current operational value, and when it is held primarily for its financial capacity is measured at fair value.

28. The measurement basis used to measure current value, either current operational value or fair value, shall be applied consistently to an item or part of an item of property, plant, and equipment at each measurement date, unless the primary objective for which the entity holds an item or part of an item of property, plant, and equipment has changed. In that case a change in the current value measurement basis, from current operational value to fair value, or vice versa, is appropriate.

29. **Revaluations shall be made with sufficient regularity to ensure that the carrying amount does not differ materially from that which would be determined using current value at the reporting date. The accounting treatment for revaluations is set out in paragraphs 36-38.**

30. The frequency of revaluations depends upon the changes in current values of the items of property, plant, and equipment being revalued. When the current value of a revalued asset differs materially from its carrying amount, a further revaluation is necessary. Some items of property, plant, and equipment experience significant and volatile changes in current value, thus necessitating annual revaluation. Such frequent revaluations are unnecessary for items of property, plant, and equipment with only insignificant changes in current value. Instead, it may be necessary to revalue the item only every three or five years.

31. When an item of property, plant, and equipment is revalued, the carrying amount of that asset is adjusted to the revalued amount. At the date of the revaluation, the asset is treated in one of the following ways:

    (a) The gross carrying amount is adjusted in a manner that is consistent with the revaluation of the carrying amount of the asset. For example, the gross carrying amount may be restated by reference to observable market data or it may be restated proportionately to the change in the carrying amount. The accumulated depreciation at the date of the revaluation is adjusted to equal the difference between the gross carrying amount and the carrying amount of the asset after taking into account accumulated impairment losses; or

    (b) The accumulated depreciation is eliminated against the gross carrying amount of the asset.

    The amount of the adjustment of accumulated depreciation forms part of the increase or decrease in carrying amount that is accounted for in accordance with paragraphs 36 and 37.

32. **If an item of property, plant, and equipment is revalued, the entire class of property, plant, and equipment to which that asset belongs shall be revalued.**

33. Impairment losses and reversals of impairment losses of an asset under IPSAS 21 and IPSAS 26 do not necessarily give rise to the need to revalue the class of assets to which that asset, or group of assets, belongs.

34. A class of property, plant, and equipment is a grouping of assets of a similar nature or function in an entity's operations. The following are examples of separate classes:

    (a) Land;

    (b) Operational buildings;

    (c) Machinery;

    (d) Ships;

    (e) Aircraft;

    (f) Weapons systems;

(g) Motor vehicles;

(h) Furniture and fixtures;

(i) Office equipment;

(j) Oil rigs;

(k) Bearer plants;

(l) Heritage collections; and

(m) Infrastructure.

When grouping property, plant, and equipment into classes, an entity may identify items with similar nature, but held for different functions, or vice versa. For example, while various parcels of land might be similar in nature, some may be held for agricultural purposes and others for commercial purposes. This may result in the entity identifying two classes of land and presenting information using historical cost for one class and current value for the other.

35. The items within a class of property, plant, and equipment are revalued simultaneously in order to avoid selective revaluation of assets and the reporting of amounts in the financial statements that are a mixture of costs and values as at different dates. However, a class of assets may be revalued on a rolling basis provided revaluation of the class of assets is completed within a short period and provided the revaluations are kept up to date.

36. **If the carrying amount of a class of assets is increased as a result of a revaluation, the increase shall be credited directly to revaluation surplus. However, the increase shall be recognized in surplus or deficit to the extent that it reverses a revaluation decrease of the same class of assets previously recognized in surplus or deficit.**

37. **If the carrying amount of a class of assets is decreased as a result of a revaluation, the decrease shall be recognized in surplus or deficit. However, the decrease shall be debited directly to revaluation surplus to the extent of any credit balance existing in the revaluation surplus in respect of that class of assets.**

38. **Revaluation increases and decreases relating to individual assets within a class of property, plant, and equipment must be offset against one another within that class but must not be offset in respect of assets in different classes.**

39. Some or all of the revaluation surplus included in net assets/equity in respect of property, plant, and equipment may be transferred directly to accumulated surpluses or deficits when the assets are derecognized. This may involve transferring some or the whole of the surplus when the assets within the class of property, plant, and equipment to which the surplus relates are retired or disposed of. However, some of the surplus may be transferred as the assets are used by the entity. In such a case, the amount of the surplus transferred would be the difference between depreciation, based on the revalued carrying amount of the assets and depreciation, based on the assets' original cost. Transfers from revaluation surplus to accumulated surpluses or deficits are not made through surplus or deficit.

40. Guidance on the effects of taxes on surpluses, if any, resulting from the revaluation of property, plant, and equipment can be found in the relevant international or national accounting standard dealing with income taxes.

Depreciation (see paragraphs AG24-AG36)

41. **Each part of an item of property, plant, and equipment with a cost or value that is significant in relation to the total cost or value of the item shall be depreciated separately.**

42. A significant part of an item of property, plant, and equipment may have a useful life and a depreciation method that are the same as the useful life and the depreciation method of another significant part of that same item. Such parts may be grouped in determining the depreciation charge.

43. To the extent that an entity depreciates separately some parts of an item of property, plant, and equipment, it also depreciates separately the remainder of the item. The remainder consists of the parts of the item that are individually not significant. If an entity has varying expectations for these parts, approximation techniques may be necessary to depreciate the remainder in a manner that faithfully represents the consumption pattern and/or useful life of its parts.

44. An entity may choose to depreciate separately the parts of an item that do not have a cost that is significant in relation to the total cost of the item.

45. **The depreciation charge for each period shall be recognized in surplus or deficit, unless it is included in the carrying amount of another asset.**

46. The depreciation charge for a period is usually recognized in surplus or deficit. However, sometimes, the future economic benefits or service potential embodied in an asset is absorbed in producing other assets. In this case, the depreciation charge constitutes part of the cost of the other asset, and is included in its carrying amount. For example, the depreciation of manufacturing plant and equipment is included in the costs of conversion of inventories (see IPSAS 12). Similarly, depreciation of property, plant, and equipment used for development activities may be included in the cost of an intangible asset recognized in accordance with IPSAS 31, *Intangible Assets*.

Depreciable Amount and Depreciation Period (see paragraphs AG25-AG27)

47. **The depreciable amount of an asset shall be allocated on a systematic basis over its useful life.**

48. **The residual value and the useful life of an asset shall be reviewed at least at each annual reporting date and, if expectations differ from previous estimates, the change(s) shall be accounted for as a change in an accounting estimate in accordance with IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*.**

49. Depreciation is recognized even if the current value of the asset exceeds its carrying amount, as long as the asset's residual value does not exceed its carrying amount. Repair and maintenance of an asset does not negate the need to depreciate it. Conversely, some assets may be poorly maintained or maintenance may be deferred indefinitely because of budgetary constraints. Where asset management policies exacerbate the wear and tear of an asset, its useful life should be reassessed, and/or the asset tested for impairment in accordance with paragraph 59, and adjusted accordingly.

50. Land and buildings are separable assets and are accounted for separately, even when they are acquired together. With some exceptions, such as quarries and sites used for landfill, land has an indefinite useful life and therefore is not depreciated. Buildings generally have a finite useful life and therefore are depreciable assets. An increase in the value of the land on which a building stands does not affect the determination of the depreciable amount of the building.

51. If the carrying amount of land includes the cost of site dismantlement, removal, and restoration, that portion of the land asset is depreciated over the period of benefits or service potential obtained by incurring those costs. In some cases, the land itself may have a finite useful life, in which case it is depreciated in a manner that reflects the benefits or service potential to be derived from it.

Finite and Indefinite Useful Lives (see paragraphs AG28-AG32)

52. An entity shall assess whether the useful life of property, plant, and equipment is finite or indefinite and, if finite, the length of, or number of production or similar units constituting that useful life. Land usually has an indefinite useful life. There is a rebuttable presumption that non-land property, plant, and equipment have finite useful lives. Property, plant, and equipment shall be regarded by the entity as having an indefinite useful life when, based on an analysis of all of the relevant factors, there is no foreseeable limit to the period over which the asset is expected to provide service potential to, or be used to generate net cash inflows for the entity.

53. An item of property, plant, and equipment with a finite useful life is depreciated. An item of property, plant, and equipment with an indefinite useful life is not depreciated.

54. The term “indefinite” does not mean “infinite.” The useful life of property, plant, and equipment should reflect evidence on factors that could affect the useful life at the time of estimating the asset’s useful life. Projections of those factors and the estimated useful life should be realistic rather than optimistic or pessimistic, which means that they should be supported by objective evidence and generate relevant and faithfully representative measures of asset value and depreciation, rather than optimistic or pessimistic projections of those factors. For example, a conclusion that the useful life of property, plant, and equipment is indefinite should not depend on planned future expenditure in excess of that required to maintain the asset at its current standard of performance. Nor should such a conclusion depend on preservation actions for which there is no realistic likelihood under present or projected budget constraints.

55. The useful life of an item of property, plant, and equipment may be very long or even indefinite. Uncertainty about an asset’s useful life when it is very long does not justify choosing a life that is unrealistically short.

Annual Impairment Reviews for Assets with Indefinite Useful Lives

56. An entity is required to review property, plant, and equipment with an indefinite useful life annually for indications of impairment in accordance with IPSAS 21 and IPSAS 26.

Depreciation Method (see paragraphs AG33-AG34)

57. **The depreciation method shall reflect the pattern in which the asset’s future economic benefits or service potential is expected to be consumed by the entity.**

58. **The depreciation method applied to an asset shall be reviewed at least at each annual reporting date and, if there has been a significant change in the expected pattern of the consumption of the future economic benefits or service potential embodied in the asset, the method shall be changed to reflect the changed pattern. Such a change shall be accounted for as a change in an accounting estimate in accordance with IPSAS 3.**

Impairment

59. To determine whether an item of property, plant, and equipment is impaired, an entity applies IPSAS 21 or IPSAS 26, as appropriate. These Standards explain how an entity reviews the carrying amount of its assets, how it determines the recoverable service amount or recoverable amount of an asset, and when it recognizes, or reverses the recognition of, an impairment loss.

Compensation for Impairment

60. **Compensation from third parties for items of property, plant, and equipment that were impaired, lost, or given up shall be included in surplus or deficit when the compensation becomes receivable.**

61. Impairments or losses of items of property, plant, and equipment, related claims for or payments of compensation from third parties, and any subsequent purchase, construction, or development of replacement assets are separate economic events and are accounted for separately as follows:

(a) Impairments of items of property, plant, and equipment are recognized in accordance with IPSAS 21 or IPSAS 26, as appropriate;

(b) Derecognition of items of property, plant, and equipment retired or disposed of is determined in accordance with this Standard;

(c) Compensation from third parties for items of property, plant, and equipment that were impaired, lost, or given up is included in determining surplus or deficit when it becomes receivable; and

(d) The cost of items of property, plant, and equipment restored, purchased, constructed, or developed as replacement is determined in accordance with this Standard.

Derecognition

62. **The carrying amount of an item of property, plant, and equipment shall be derecognized:**

(a) **On disposal; or**

(b) **When no future economic benefits or service potential is expected from its use or disposal.**

63. **The gain or loss arising from the derecognition of an item of property, plant, and equipment shall be included in surplus or deficit when the item is derecognized (unless IPSAS 43, *Leases* requires otherwise on a sale and leaseback).**

64. The disposal of an item of property, plant, and equipment may occur in a variety of ways (e.g., by sale, by entering into a finance lease or by donation). The date of disposal of an item of property, plant, and equipment is the date the recipient obtains control of that item in accordance with the requirements, and any enforceable obligations or compliance obligations are satisfied in IPSAS 47, *Revenue*. IPSAS 43 applies to disposal by a sale and leaseback.

65. If, under the recognition principle in paragraph 6, an entity recognizes in the carrying amount of an item of property, plant, and equipment the cost of a replacement for part of the item, then it derecognizes the carrying amount of the replaced part regardless of whether the replaced part had been depreciated separately. If it is not practicable for an entity to determine the carrying amount of the replaced part, it may use the cost of the replacement as an indication of what the cost of the replaced part was at the time it was acquired, constructed, or developed.

66. **The gain or loss arising from the derecognition of an item of property, plant, and equipment shall be determined as the difference between the net disposal proceeds, if any, and the carrying amount of the item.**

67. The amount of consideration to be included in the surplus or deficit arising from the derecognition of property, plant, and equipment is determined in accordance with the requirements for determining the transaction consideration in paragraphs 109–132 of IPSAS 47. Subsequent changes to the estimated amount of consideration included in surplus or deficit shall be accounted for in accordance with the requirements for changes in the transaction consideration in IPSAS 47.

68. However, an entity that, in the course of its activities, routinely provides items of property, plant, and equipment that it has held for rental to others shall transfer such assets to inventories at their carrying amount when they cease to be rented and become held for sale. The amount of consideration from the disposal of such assets shall be recognized as revenue in accordance with IPSAS 47. IPSAS 44 does not apply when assets that are held for sale in the ordinary course of its operations are transferred to inventories.

Disclosure

General Disclosure for Property, Plant, and Equipment

69. **The financial statements shall disclose, for each class of property, plant, and equipment recognized in the financial statements:**

    (a) **The measurement bases used for determining the gross carrying amount;**

    (b) **The depreciation methods used;**

    (c) **The useful lives or the depreciation rates used;**

    (d) **The gross carrying amount and the accumulated depreciation (aggregated with accumulated impairment losses) at the beginning and end of the period; and**

    (e) **A reconciliation of the carrying amount at the beginning and end of the period showing:**

        (i) **Additions;**

        (ii) **Assets classified as held for sale or included in a disposal group classified as held for sale in accordance with IPSAS 44 and other disposals;**

        (iii) **Acquisitions through public sector combinations;**

        (iv) **Increases or decreases resulting from revaluations under paragraphs 29, 36, and 37 and from impairment losses (if any) recognized or reversed directly in net assets/equity in accordance with IPSAS 21 or IPSAS 26, as appropriate;**

        (v) **Impairment losses recognized in surplus or deficit in accordance with IPSAS 21 or IPSAS 26, as appropriate;**

        (vi) **Impairment losses reversed in surplus or deficit in accordance with IPSAS 21 or IPSAS 26, as appropriate;**

        (vii) **Depreciation;**

        (viii) **The net exchange differences arising on the translation of the financial statements from the functional currency into a different presentation currency, including the translation of a foreign operation into the presentation currency of the reporting entity; and**

        (ix) **Other changes.**

70. **The financial statements shall also disclose for each class of property, plant, and equipment recognized in the financial statements:**

    (a) **The existence and amounts of restrictions on title, and property, plant, and equipment pledged as securities for liabilities;**

    (b) **The amount of expenditures recognized in the carrying amount of an item of property, plant, and equipment in the course of its construction or development; and**

    (c) **The amount of contractual commitments for the acquisition, construction, or development of property, plant, and equipment.**

71. **If not presented separately in the statement of financial performance, the financial statements shall also disclose:**

    (a) **The amount of compensation from third parties for items of property, plant, and equipment that were impaired, lost or given up that is included in surplus or deficit; and**

(b) **The amounts of proceeds and cost included in surplus or deficit in accordance with paragraph 18 that relate to items produced that are not an output of the entity's ordinary activities, and which line item(s) in the statement of financial performance include(s) such proceeds and cost.**

72. Selection of the depreciation method and the estimation of the useful life of the assets are matters of judgment. Therefore, disclosure of the methods adopted and the estimated useful lives or depreciation rates provides users of financial statements with information that allows them to review the policies selected by management, and enables comparisons to be made with other entities. For similar reasons, it is necessary to disclose:

(a) Depreciation, whether recognized in surplus or deficit or as a part of the cost of other assets, during a period; and

(b) Accumulated depreciation at the end of the period.

73. In accordance with IPSAS 3, an entity discloses the nature and effect of a change in an accounting estimate that has an effect in the current period or is expected to have an effect in subsequent periods. For property, plant, and equipment, such disclosure may arise from changes in estimates with respect to:

(a) Residual values;

(b) The estimated costs of dismantling, removing, or restoring items of property, plant, and equipment;

(c) Useful lives; and

(d) Depreciation methods.

74. **If a class of property, plant, and equipment is stated at revalued amounts, the following shall be disclosed:**

(a) **The effective date of the revaluation;**

(b) **Whether an independent valuer was involved;**

(c) **The revaluation surplus, indicating the change for the period and any restrictions on the distribution of the balance to owners;**

(d) **The sum of all revaluation surpluses for individual items of property, plant, and equipment within that class; and**

(e) **The sum of all revaluation deficits for individual items of property, plant, and equipment within that class.**

75. In accordance with IPSAS 21 and IPSAS 26, an entity discloses information on impaired property, plant, and equipment in addition to the information required by paragraph (iv)-(vi).

76. Users of financial statements may also find the following information relevant to their needs:

(a) The carrying amount of temporarily idle property, plant, and equipment;

(b) The gross carrying amount of any fully depreciated property, plant, and equipment that is still in use;

(c) The carrying amount of property, plant, and equipment retired from active use and not classified as held for sale in accordance with IPSAS 44; and

(d) When the historical cost model is used, the current value (current operational value or fair value) of property, plant, and equipment when this is materially different from the carrying amount.

Therefore, entities are encouraged to disclose these amounts.

Disclosure of Unrecognized Heritage Property, Plant, and Equipment (see paragraphs AG37-AG38)

77. **Where heritage property, plant, and equipment or a class of heritage property, plant, and equipment is not recognized in the financial statements because, at initial measurement, its cost or current value cannot be measured reliably, the entity shall disclose:**

    (a) **The difficulties in obtaining a reliable measurement that prevented recognition; and**

    (b) **The significance of the unrecognized heritage property, plant, and equipment in relation to delivery of the entity's objectives.**

78. Where subsequent expenditures on unrecognized heritage property, plant, and equipment are recognized, the disclosure requirements in paragraphs 69-76 and 79-84 will apply.

Current Value Measurement

79. **An entity shall disclose information that helps users of its financial statements assess both of the following:**

    (a) **For property, plant, and equipment that are measured at current operational value or fair value in the statement of financial position after initial recognition, the measurement techniques and inputs used to develop those measurements.**

    (b) **For fair value measurements using significant unobservable inputs (Level 3), or current operational value measurements estimated using significant unobservable inputs, the effect of the measurements on surplus or deficit or net assets/equity for the period.**

80. To meet the objectives in paragraph 79, an entity shall consider all the following:

    (a) The level of detail necessary to satisfy the disclosure requirements;

    (b) How much emphasis to place on each of the various requirements;

    (c) How much aggregation or disaggregation to undertake; and

    (d) Whether users of financial statements need additional information to evaluate the quantitative information disclosed.

    If the disclosures provided in accordance with this Standard are insufficient to meet the objectives in paragraph 79, an entity shall disclose additional information necessary to meet those objectives.

81. To meet the objectives in paragraph 79, an entity shall disclose, at a minimum, the following information for each class of property, plant, and equipment (see paragraph 82 for information on determining appropriate classes of property, plant, and equipment for current value measurement disclosures) measured at current operational value or fair value in the statement of financial position after initial recognition:

    (a) The current operational value or fair value measurement at the end of the reporting period;

    (b) If there has been a change in measurement basis (e.g., changing from current operational value to fair value), the entity shall disclose that change and the reason(s) for making it;

    (c) For current operational value measurements, whether the current operational value measurements are estimated using observable or unobservable inputs. For fair value measurements, the level of the fair value hierarchy within which the fair value measurements are categorized in their entirety (Level 1, 2 or 3);

    (d) For current operational value or fair value measurements estimated using unobservable inputs, a description of the measurement technique(s) and the inputs used in the current operational value or fair value measurement. If there has been a change in measurement technique (e.g., changing from a

cost approach to a market approach or the use of an additional measurement technique), the entity shall disclose that change and the reason(s) for making it. For fair value measurements categorized within Level 3 of the fair value hierarchy, or for current operational value or fair value measurements estimated using significant unobservable inputs, an entity shall provide quantitative information about the significant unobservable inputs used in the current operational value or fair value measurement. An entity is not required to create quantitative information to comply with this disclosure requirement if quantitative unobservable inputs are not developed by the entity when measuring current operational value or fair value (e.g., when an entity uses prices from prior transactions or third-party pricing information without adjustment). However, when providing this disclosure an entity cannot ignore quantitative unobservable inputs that are significant to the current operational value or fair value measurement and are reasonably available to the entity;

(e) For fair value measurements categorized within Level 3 of the fair value hierarchy, or for current operational value measurements estimated using significant unobservable inputs, a reconciliation from the opening balances to the closing balances, disclosing separately changes during the period attributable to the following:

(i) Total gains or losses for the period recognized in surplus or deficit, and the line item(s) in surplus or deficit in which those gains or losses are recognized;

(ii) Total gains or losses for the period recognized in net assets/equity, and the line item(s) in net assets/equity in which those gains or losses are recognized; and

(iii) Purchases, and sales (each of those types of changes disclosed separately);

(f) For fair value measurements categorized within Level 3 of the fair value hierarchy, or for current operational value estimated using significant unobservable inputs, the amount of the total gains or losses for the period in (i) included in surplus or deficit that is attributable to the change in unrealized gains or losses relating to those items of property, plant, and equipment held at the end of the reporting period, and the line item(s) in surplus or deficit in which those unrealized gains or losses are recognized;

(g) For fair value measurements categorized within Level 3 of the fair value hierarchy, or for current operational value measurements estimated using significant unobservable inputs, a description of the valuation processes used by the entity (including, for example, how an entity decides its valuation policies and procedures and analyses changes in current operational value or fair value measurements from period to period); and

(h) For fair value measurements categorized within Level 3 of the fair value hierarchy or for current operational value measurements estimated using significant unobservable inputs a narrative description of the sensitivity of the current operational value or fair value measurement to changes in unobservable inputs if a change in those inputs to a different amount might result in a significantly higher or lower current operational value or fair value measurement. If there are interrelationships between those inputs and other unobservable inputs used in the current operational value or fair value measurement, an entity shall also provide a description of those interrelationships and of how they might magnify or mitigate the effect of changes in the unobservable inputs on the current operational value or fair value measurement. To comply with that disclosure requirement, the narrative description of the sensitivity to changes in unobservable inputs shall include, at a minimum, the unobservable inputs disclosed when complying with (d).

82. For the purposes of current value measurement disclosures an entity may decide that a greater disaggregation of the classes of property, plant, and equipment (see paragraph 34) is required on the basis of (a) the measurement bases applied, and (b) the level of the fair value hierarchy within which the fair value

measurement is categorized, or the extent to which the current operational value uses observable or unobservable inputs.

The number of classes may need to be greater for fair value measurements categorized within Level 3 of the fair value hierarchy, or for current operational value measurements estimated using significant unobservable inputs, because those measurements have a greater degree of uncertainty and subjectivity. Determining appropriate classes of property, plant, and equipment for which disclosures about current operational value or fair value measurements should be provided requires judgment. A class of property, plant, and equipment will often require greater disaggregation than the line items presented in the statement of financial position. However, an entity shall provide information sufficient to permit reconciliation to the line items presented in the statement of financial position.

83. For each class of property, plant, and equipment measured on the historical cost basis in the statement of financial position but for which the current operational value or fair value is disclosed, an entity shall disclose the information required by paragraph 81(b), (c) and (g). However, an entity is not required to provide the quantitative disclosures about significant unobservable inputs used in fair value measurements categorized within Level 3 of the fair value hierarchy, or for current operational value or fair value measurements estimated using significant unobservable inputs, required by paragraph (d). For such property, plant, and equipment, an entity does not need to provide the other current value measurement disclosures required by this Standard.

84. An entity shall present the quantitative current value measurement disclosures required by this Standard in a tabular format unless another format is more appropriate.

Effective Date and Transition

Effective Date

85. **An entity shall apply this Standard for annual financial statements covering periods beginning on or after January 1, 2025. Earlier application is permitted for entities that apply IPSAS 43, IPSAS 44, and IPSAS 46 at or before the date of initial application of the Standard. If an entity applies this Standard for a period beginning before January 1, 2025, it shall disclose that fact.**

85A. **Paragraphs 64, 67, and 68 were amended by IPSAS 47, issued in May 2023. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2026. Earlier application is encouraged. If an entity applies the amendments for a period beginning before January 1, 2026, it shall disclose that fact and apply IPSAS 47 at the same time.**

85B. **Paragraph 3 was amended by IPSAS 50, issued in November 2024. An entity shall apply this amendment for annual financial statements covering periods beginning on or after January 1, 2027. Earlier application is permitted. If an entity applies the amendments for a period beginning before January 1, 2027, it shall disclose that fact.**

85C. **Paragraph 25 was amended by *Amendments to IPSAS Standards: Specific IFRIC Interpretations*, issued in January 2025. An entity shall apply these amendments for annual periods beginning on or after January 1, 2026. Earlier application is encouraged. If an entity applies these amendments to financial statements for a period beginning before January 1, 2026, it shall disclose that fact.**

85D. **Paragraphs 79(a) and 81(d) are amended by Part 3 of *Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement*, issued in August 2025. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2028. Earlier application is permitted.**

85E. **Paragraphs 3(e) and AG2 were amended by IPSAS 51, issued in January 2026. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2028. Earlier application is permitted. If an entity applies the amendments for a period beginning before January 1, 2028, it shall disclose that fact and apply IPSAS 51 at the same time.**

86. When an entity adopts accrual basis IPSAS Standards as defined in IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards* for financial reporting purposes subsequent to this effective date, this Standard applies to the entity's annual financial statements covering periods beginning on or after the date of adoption of IPSAS Standards.

Transition

87. **An entity shall apply this Standard retrospectively, in accordance with IPSAS 3 except that:**

(a) **An entity may elect to measure heritage assets at their deemed cost when reliable cost information about these assets is not available at the date of application of this Standard.**

(b) **If, on initial application of this Standard, there is a difference between the previous carrying amount at fair value and the new carrying amount at fair value or current operational value, an entity shall recognize that difference as an adjustment to the opening accumulated surplus or deficit (or other component of net assets/equity, as appropriate) without restatement of comparative information.**

88. **For entities that have previously applied IPSAS 17 (2006), *Property, Plant, and Equipment* the requirements of paragraphs 21–22 regarding the initial measurement of an item of property, plant, and equipment acquired in an exchange of assets transaction shall be applied prospectively only to future transactions.**

Withdrawal of IPSAS 17 (2006)

89. This Standard supersedes IPSAS 17 issued in 2006. IPSAS 17 remains applicable until IPSAS 45, *Property, Plant, and Equipment* is applied or becomes effective, whichever is earlier.

Appendix A

Application Guidance

This Appendix is an integral part of IPSAS 45.

Scope (see paragraphs 2-4)

AG1. This Standard applies to all property, plant, and equipment including:

(a) Heritage;

(b) Infrastructure;

(c) Service concession arrangement assets after initial recognition and measurement in accordance with IPSAS 32, *Service Concession Arrangements: Grantor*; and

(d) Weapons systems.

Heritage Assets

AG2. Some property, plant, and equipment are described as heritage assets because of their rarity and/or significance in relation, but not limited, to their archeological, architectural, agricultural, artistic, cultural, historical, scientific, or technological features. Entities usually intend to hold heritage assets for long periods and preserve them for the benefit of present and future generations. Examples of heritage assets include historic buildings, monuments, museum collections, and works of art.

AG3. Heritage assets typically have the following distinguishing characteristics:

(a) They have restrictions on their use and/or disposal;

(b) They are irreplaceable; and

(c) They have long and sometimes indefinite useful lives.

Infrastructure Assets

AG4. Some property, plant, and equipment are described as infrastructure assets because they comprise a number of assets that make up networks or systems that serve the community at large. Generally, infrastructure assets have long lives because the number of assets that make up these networks or systems are continually maintained, replaced and refurbished. If a number of these assets were removed, the network or system may not achieve its service potential objective.

AG5. Infrastructure assets typically have the following distinguishing characteristics:

(a) They are networks or systems; and

(b) They have long useful lives.

AG6. Although not confined to entities in the public sector, significant infrastructure assets are frequently found in the public sector. Examples include:

(a) Electricity transmission networks, which may comprise assets such as power generating plants, substations, switchyards, transmission line towers, distribution system equipment, energy control centers, communication systems and equipment, emergency power backup equipment, emergency operations centers and service and maintenance facilities;

(b) Road networks, which may comprise assets such as pavements, formation, curbs and channels, footpaths, bridges, signal and lighting; and

(c) Water systems, which may comprise assets such as dams, pipelines, tunnels, canals, terminal reservoirs, tanks, wells, pumps, and treatment plants.

Weapons Systems

AG7. Weapons systems will normally meet the definition of property, plant, and equipment, and should be recognized in accordance with this Standard. Weapons systems include vehicles and other equipment, such as warships, submarines, military aircraft, tanks, missile carriers and launchers that are used continuously in the provision of defense services, even if their peacetime use is simply to provide deterrence. Some single-use items, such as certain types of ballistic missiles, may provide an ongoing service of deterrence against aggressors and, therefore, can be classified as weapons systems.

Definitions (see paragraph 5)

Property, Plant, and Equipment as Assets

AG8. In the public sector, there may be uncertainty whether certain items of property, plant, and equipment are an asset as defined in IPSAS 1, *Presentation of Financial Statements*. This is because to be recognized as an asset, an item of property, plant, and equipment must meet all three criteria of an asset: a resource, presently controlled by the entity and arose from a past transaction or other past event.

AG9. Items that a reporting entity uses to deliver services to the public will be resources from the reporting entity's perspective when those services contribute to achieving the entity's service delivery and other objectives. For example, heritage items that are used purely for the benefit of the public can have service potential and be resources because the entity has the objective of making heritage accessible to the public. Where an entity's objectives are to provide heritage-related services such as the appreciation and study of heritage, the entity holds heritage items to achieve those objectives and the heritage items have service potential and are resources from the entity's perspective. Similarly, infrastructure assets that are used to deliver public services (e.g., road networks or water systems) will be resources to an entity that holds them if those services contribute to achieving the entity's service delivery and other objectives.

AG10. In assessing whether it presently controls a resource, an entity assesses whether one or more of the following indicators of control exists:

(a) Legal ownership;

(b) Access to the resource, or the ability to deny or restrict others to access the resource;

(c) The means to ensure that the resource is used to achieve its objectives; or

(d) The existence of an enforceable right to service potential or the ability to generate economic benefits arising from the resource.

An entity is more likely to demonstrate control if it satisfies most of these indicators. However, assessments of control involve judgment, and control may exist when only some of these indicators are satisfied. Conversely, control may not exist even when most of these indicators are met.

AG11. No one indicator is more important than another indicator. Legal ownership is only one indicator of demonstrating control of a resource. An entity may demonstrate that it controls the resource even when there is no legal ownership because it can direct the use of the resource and obtain the economic benefits or service potential that may flow from it. Conversely, an entity may have legal ownership but no rights to service potential or ability to generate future economic benefits. In such circumstances, an entity considers substance over form in determining whether it controls an asset.

Recognition (see paragraphs 6-10)

Spare Parts, Stand-By Equipment, and Servicing Equipment

AG12. Items such as spare parts, stand-by equipment and servicing equipment are recognized in accordance with this Standard when they meet the definition of property, plant, and equipment. Otherwise, such items are classified as inventory (see IPSAS 12, *Inventories*).

Subsequent Costs

AG13. Under the recognition principle in paragraph 6, an entity does not recognize in the carrying amount of an item of property, plant, and equipment the costs of the day-to-day servicing of the item. Rather, these costs are recognized in surplus or deficit as incurred. Costs of day-to-day servicing are primarily the costs of labor and consumables, and may include the cost of small parts. The purpose of these expenditures is often described as for the “repairs and maintenance” of the item of property, plant, and equipment.

AG14. Parts of some items of property, plant, and equipment may require replacement at regular intervals. For example, a road may need resurfacing every few years, a furnace may require relining after a specified number of hours of use, or aircraft interiors such as seats and galleys may require replacement several times during the life of the airframe. Items of property, plant, and equipment may also be required to make a less frequently recurring replacement, such as replacing the interior walls of a building. Under the recognition principle in paragraph 6, an entity recognizes in the carrying amount of an item of property, plant, and equipment the cost of replacing part of such an item when that cost is incurred if the recognition criteria are met. The carrying amount of those parts that are replaced is derecognized in accordance with the derecognition provisions of this Standard (see paragraphs 62-68).

AG15. A condition of continuing to operate an item of property, plant, and equipment (for example, an aircraft) may be performing regular major inspections for faults regardless of whether parts of the item are replaced. When each major inspection is performed, its cost is recognized in the carrying amount of the item of property, plant, and equipment as a replacement if the recognition criteria are satisfied. Any remaining carrying amount of the cost of the previous inspection (as distinct from physical parts) is derecognized. This occurs regardless of whether the cost of the previous inspection was identified in the transaction in which the item was acquired, constructed, or developed. If necessary, the estimated cost of a future similar inspection may be used as an indication of what the cost of the existing inspection component was when the item was acquired, constructed, or developed.

Subsequent Costs on Unrecognized Heritage Property, Plant, and Equipment

AG16. An entity recognizes subsequent expenditure on heritage property, plant, and equipment in accordance with the recognition principle in paragraph 6. Recognition of such subsequent expenditure as an asset is unaffected by whether or not the underlying heritage property, plant, and equipment was initially recognized. If the subsequent expenditure relates to heritage property, plant, and equipment, that was not recognized initially, because its cost or current value could not be measured reliably, it should nonetheless be reviewed in light of paragraph 6 to determine whether or not it meets the recognition principle and should be recognized as an asset.

Initial Measurement (see paragraphs 11-23)

Elements of Cost

AG17. Examples of costs that are not costs of an item of property, plant, and equipment are:

(a) Costs of opening a new facility;

(b) Costs of introducing a new product or service (including costs of advertising and promotional activities);

(c) Costs of conducting an operation in a new location or with a new class of purchasers (including costs of staff training);

(d) Administration and other general overhead costs; and

(e) Costs of day-to-day servicing or repairs and maintenance.

AG18. The cost of a self-constructed asset is determined using the same principles as for an acquired asset. If an entity makes similar assets for sale in the normal course of operations, the cost of the asset is usually the same as the cost of constructing an asset for sale (see IPSAS 12). Therefore, any internal surpluses are eliminated in arriving at such costs. Similarly, the cost of abnormal amounts of wasted material, labor, or other resources incurred in self-constructing an asset is not included in the cost of the asset. IPSAS 5, *Borrowing Costs*, establishes criteria for the recognition of interest as a component of the carrying amount of a self-constructed item of property, plant, and equipment.

AG19. Bearer plants are accounted for in the same way as self-constructed items of property, plant, and equipment before they are in the location and condition necessary to be capable of operating in the manner intended by management. Consequently, references to 'construction' in this Standard should be read as covering activities that are necessary to cultivate bearer plants before they are in the location and condition necessary to be capable of operating in the manner intended by management.

Subsequent Measurement (see paragraphs 24-61)

Current Value Model (Paragraphs 27-40)

AG20. After recognition, an item or part of an item of property, plant, and equipment whose current value can be measured in a faithfully representative manner may be carried at a revalued amount, being its:

(a) Current operational value; or

(b) Fair value;

at the date of the revaluation, less any subsequent accumulated depreciation, and subsequent accumulated impairment losses.

Financial and Operational Capacity

AG21. The primary objective for which an entity holds an item or part of an item of property, plant, and equipment is an important consideration when determining the current value measurement basis. An item or part of an item of property, plant, and equipment held for its:

(a) Operational capacity supports the provision of services in future periods through physical and other resources. This requires information on the value of the item or part of an item of property, plant, and equipment as it is currently used by the entity. An item or part of an item of property, plant, and equipment held with the primary objective of service delivery is held for its operational capacity and is measured at current operational value; and

(b) Financial capacity provides an entity with the means to fund its activities. This requires information on the amount that would be received on the sale of the asset or in the revenue it generates in use. An item or part of an item of property, plant, and equipment held with the primary objective of generating a financial return is held for its financial capacity and is measured at fair value.

AG22. In certain instances, an item or part of an item of property, plant, and equipment may generate a financial return although it is primarily held for service delivery purposes. For example, a waste disposal plant is operated to ensure the safe disposal of medical waste generated by state-controlled hospitals, but the plant

also treats a small amount of medical waste generated by other private hospitals on a commercial basis. In this instance, the disposal waste plant would be measured at current operational value.

AG23. In some cases, it may not be clear whether the intended primary objective of holding an item or part of an item of property, plant, and equipment is for its operational or financial capacity. Judgment is needed. An entity develops criteria so that it can exercise judgment consistently in concluding whether an item or part of an item of property, plant, and equipment is held primarily for its operational or financial capacity. When the intended primary objective of holding an item or part of an item of property, plant, and equipment cannot be determined, given the overall objectives of most public sector entities, the presumption is that an item or part of an item of property, plant, and equipment is held for its operational capacity.

Depreciation (see paragraphs 41-58)

AG24. An entity allocates the amount initially recognized in respect of an item of property, plant, and equipment to its significant parts and depreciates separately each such part. For example, it may be required to depreciate separately the substructure and the surface of a road. Similarly, it may be appropriate to depreciate separately the airframe and engines of an aircraft. If an entity acquires property, plant, and equipment subject to an operating lease in which it is the lessor, it may also be appropriate to depreciate separately amounts reflected in the cost of that item that are attributable to favorable or unfavorable lease terms relative to market terms.

Depreciable Amount and Depreciation Period (see paragraphs 47-51)

AG25. The depreciable amount of an asset is determined after deducting its residual value. In practice, the residual value of an asset is often insignificant, and therefore immaterial in the calculation of the depreciable amount.

AG26. The residual value of an asset may increase to an amount equal to or greater than the asset's carrying amount. If it does, the asset's depreciation charge is zero unless and until its residual value subsequently decreases to an amount below the asset's carrying amount.

AG27. Depreciation of an asset begins when it is available for use, i.e., when it is in the location and condition necessary for it to be capable of operating in the manner intended by management. Depreciation of an asset ceases at the earlier of the date that the asset is classified as held for sale (or included in a disposal group that is classified as held for sale) in accordance with IPSAS 44, *Non-current Assets Held for Sale and Discontinued Operations* and the date when the asset is derecognized. Therefore, depreciation does not cease when the asset becomes idle or is retired from active use and held for disposal unless the asset is fully depreciated. However, under usage methods of depreciation, the depreciation charge can be zero while there is no production.

Finite and Indefinite Useful Lives (see paragraphs 52-55)

AG28. The useful lives of property, plant, and equipment, including buildings, are generally finite. However, there are circumstances in which property, plant, and equipment could have an indefinite useful life. For example, a heritage painting or sculpture held in a protective environment that is carefully controlled to preserve the asset could be considered to have an indefinite useful life, so long as those conditions continue to apply.

AG29. Given the history of rapid changes in technology, it will often be the case that computers and other property, plant, and equipment susceptible to technological obsolescence have short useful lives. Expected future reductions in the selling price of an item that was produced using property, plant, and equipment could indicate the expectation of technological or commercial obsolescence of the asset, which, in turn, might reflect a reduction of the future economic benefits or service potential embodied in the asset.

AG30. With some exceptions, such as quarries and sites used for landfill, land has an indefinite useful life and therefore is not depreciated. Another example of land with a finite useful life is when land is being encroached by rising sea levels with the result that the entity expects that, within a finite period of time, the land will no longer be useable due either to a severe and continual risk of regular flooding or actual submersion beneath the water.

AG31. An entity that controls land that is being consumed as a result of, for example, mining or quarrying activities will need to consider the period over which economic benefits or service potential are expected to be derived from, and the effect of, carrying out those activities on the value of the land to determine the appropriate depreciable period and amount.

AG32. Where land is being lost or displaced as a result of, for example, coastline erosion, the entity will need to apply:

(a) The derecognition requirements in paragraphs 62-68 of this Standard; or

(b) The impairment requirement in IPSAS 21, *Impairment of Non-Cash-Generating Assets* or IPSAS 26, *Impairment of Cash-Generating Assets* depending on the circumstances.

Depending on the factors associated with the loss or displacement of land, an entity may need to consider the appropriateness of depreciating the land in future reporting periods, and should continue to assess for impairment in accordance with the requirements of this Standard.

Depreciation Method (see paragraphs 57-58)

AG33. A variety of depreciation methods can be used to allocate the depreciable amount of an asset on a systematic basis over its useful life. These methods include the straight-line method, the diminishing balance method, and the units of production method. Straight-line depreciation results in a constant charge over the useful life if the asset's residual value does not change. The diminishing balance method results in a decreasing charge over the useful life. The units of production method results in a charge based on the expected use or output. The entity selects the method that most closely reflects the expected pattern of consumption of the future economic benefits or service potential embodied in the asset. That method is applied consistently from period to period unless there is a change in the expected pattern of consumption of those future economic benefits or service potential.

AG34. A depreciation method that is based on revenue that is generated by an activity that includes the use of an asset is not appropriate. The revenue generated by an activity that includes the use of an asset generally reflects factors other than the consumption of the economic benefits or service potential of the asset. For example, revenue is affected by other inputs and processes, selling activities and changes in sales volumes and prices. The price component of revenue may be affected by inflation, which has no bearing upon the way in which an asset is consumed.

Depreciation – Useful Life of an Asset (see paragraphs 41-55)

AG35. The future economic benefits or service potential embodied in an item of property, plant, and equipment are consumed by the entity principally through the use of the asset. However, economic, political, social, and legal factors may also affect the useful life. Technical or commercial obsolescence and wear and tear while an asset remains idle may also result in the diminution of the economic benefits or service potential that might otherwise have been obtained from the asset. The useful life is the shorter of the periods identified through consideration of these factors. Consequently, the following factors are considered in determining the useful life of an asset:

(a) Expected usage of the asset, which is assessed by reference to the asset's expected capacity or physical output;

(b) Expected physical wear and tear, which depends on operational factors such as the number of shifts for which the asset is to be used and the repair and maintenance program, and the care and maintenance of the asset while idle;

(c) The level of maintenance expenditure required to obtain the expected future economic benefits or service potential from the asset and the entity's ability and intention to reach such a level;

(d) Technical or commercial obsolescence arising from changes or improvements in production, or from a change in the market demand for the product or service output of the asset. Expected future reductions in the selling price of an item that was produced using an asset could indicate the expectation of technical or commercial obsolescence of the asset, which, in turn, might reflect a reduction of the future economic benefits or service potential embodied in the asset;

(e) The period of control over the asset and legal or similar limits on the use of the asset, such as the expiry dates of related leases;

(f) Typical product life cycles for the asset and public information on estimates of useful lives of similar assets that are used in a similar way;

(g) The stability of the industry in which the asset operates and changes in the market or government and service recipients' demand for the products or services output from the asset;

(h) Expected actions by competitors or potential competitors; and

(i) Whether the useful life of the asset is dependent on the useful life of other assets of the entity.

AG36. The useful life of an asset is defined in terms of the asset's expected utility to the entity. The asset management policy of an entity may involve the disposal of assets after a specified time, or after consumption of a specified proportion of the future economic benefits or service potential embodied in the asset. Therefore, the useful life of an asset may be shorter than its economic life. The estimation of the useful life of the asset is a matter of judgment based on the experience of the entity with similar assets.

Disclosure of Unrecognized Heritage Property, Plant, and Equipment when Cost or Current Value Cannot be Measured Reliably (see paragraphs 77-78)

AG37. The disclosures identified in paragraph 77 for unrecognized heritage property, plant, and equipment should ensure that, when read in the context of information about recognized property, plant, and equipment, the financial statements provide useful and relevant information about the entity's overall holding of property, plant, and equipment, and thereby support users' evaluation of the entity's finances, including its net financial position, and understanding of its ability to deliver services.

AG38. These disclosures may be presented in aggregate for groups or classes of property, plant, and equipment, provided this aggregation does not obscure significant information.

Appendix B

Amendments to Other IPSAS

[Deleted]

Basis for Conclusions

This Basis for Conclusions accompanies, but is not part of, IPSAS 45.

Introduction

BC1. IPSAS 17, *Property, Plant, and Equipment* was drawn primarily from International Accounting Standard (IAS) 16 (Revised 2003), *Property, Plant, and Equipment*. The IPSASB reviewed IASB's improvements to IFRS and narrow scope amendments to IAS 16 (up to May 2020) and generally concurred with the IASB's reasons for revising the IAS and with the amendments made with the exception noted in paragraphs BC24. The IPSASB revised IPSAS 17 to reflect these improvements and amendments, as appropriate.

BC2. After considering responses to the Consultation Paper (CP), *Financial Reporting for Heritage in the Public Sector*, and constituents' feedback on infrastructure assets the IPSASB concluded that:

(a) IPSAS 17 should fully apply to heritage assets that are property, plant, and equipment; and

(b) Additional authoritative and non-authoritative guidance should be included in IPSAS 45 to clarify its application to heritage and infrastructure assets.

This resulted in the development of ED 78, *Property, Plant, and Equipment* proposing the replacement of IPSAS 17.

Background

Development of ED 78, Property, Plant, and Equipment

BC3. In March 2020, the IPSASB had agreed that heritage assets should be recognized as property, plant, and equipment when they satisfy the IPSAS 17 definition and the recognition criteria (see paragraph 6). Because heritage assets are subsets of property, plant, and equipment and should be treated in accordance with the principles in IPSAS 17.

BC4. The IPSASB developed ED 78 to update its existing property, plant, and equipment guidance in IPSAS 17 to help constituents apply the principles to heritage and infrastructure assets. To this effect, additional authoritative, and non-authoritative guidance was issued. The IPSASB notes that such guidance is applicable to all property, plant, and equipment.

Heritage Assets: Additional Guidance

BC5. When developing ED 78, the IPSASB had considered whether IPSAS 45 should include additional authoritative guidance to support the application and implementation of this Standard's principles to heritage assets. On the basis that no principles existed to address these topics, the IPSASB decided to add authoritative guidance on:

(a) Characteristics of heritage assets (see paragraphs AG2-AG3);

(b) Heritage assets as a resource and assessment of control (see paragraphs AG9-AG11);

(c) Depreciation (see paragraphs 52-55 and AG28); and

(d) Disclosures on unrecognized heritage assets (see paragraphs 77-78 and paragraphs AG37-AG38).

BC6. When developing ED 78, the IPSAS had considered whether IPSAS 45 should include additional non-authoritative guidance to enhance the consistency of entities' application and implementation of IPSAS 45 to heritage assets. On this basis, the IPSASB decided to add non-authoritative guidance on:

(a) Control (see paragraphs IG6-IG8);

(b) Recognition related to subsequent expenditure on unrecognized heritage assets (see paragraph IG9);

(c) Capitalization thresholds (see paragraphs IG10-IG14);

(d) Measurement at current value (see paragraphs IG18-IG21); and

(e) Depreciation related to useful lives (see paragraphs IG30-IG33).

BC7. In developing IPSAS 45, the IPSASB decided to include additional non-authoritative guidance as noted in this Basis for Conclusions:

(a) Measurement of Heritage Assets (see Decision Tree in the Implementation Guidance); and

(b) Measurement at current value (see paragraphs IG15-IG17).

Infrastructure Assets: Additional Guidance

BC8. When developing ED 78, the IPSASB had considered whether IPSAS 45 should include additional guidance to enhance the consistency of entities' application and implementation of IPSAS 45 to infrastructure assets. The IPSASB decided to add authoritative guidance on:

(a) Characteristics and examples of infrastructure assets (see paragraphs AG4-AG6);

(b) Assessment of control (see paragraphs AG10-AG11); and

(c) Identifying parts of infrastructure assets (see paragraph AG24).

BC9. When developing ED 78, the IPSAS had considered whether IPSAS 45 should include non-authoritative guidance to enhance the consistency of the entities' application and implementation of IPSAS 45. On this basis, the IPSASB decided to add non-authoritative guidance on:

(a) Control of land under or over infrastructure assets (see paragraphs IG1-IG5 and IE1-IE5);

(b) Capitalization thresholds (see paragraphs IG10-IG14);

(c) Valuing land under or over infrastructure assets (see paragraphs IG23-IG25);

(d) Identifying parts of infrastructure assets (see paragraphs IG34-IG38);

(e) Use of information in asset management plans for financial reporting (see paragraphs IG39-IG40); and

(f) Under-maintenance of assets (see paragraphs IG41-IG44).

No Additional Guidance

BC10. When developing ED 78, on the basis that sufficient guidance existed, the IPSASB had concluded that no additional guidance was needed in IPSAS 45 to address:

(a) A separate definition for infrastructure assets because they are property, plant, and equipment;

(b) Spare parts for infrastructure assets;

(c) Costs to dismantle infrastructure assets;

(d) Separately accounting for land under or over infrastructure assets;

(e) Renewals accounting;

(f) Impairment; and

(g) Derecognition.

The IPSASB included its rationale for not adding guidance to address these issues in the Basis for Conclusions to inform constituents that the IPSASB had considered these issues.

IPSAS 45, Property, Plant, and Equipment

BC11. This Standard replaces IPSAS 17, *Property, Plant, and Equipment* and is based on IAS 16, *Property, Plant, and Equipment*. In accordance with existing practice, this Basis for Conclusions outlines only those areas where IPSAS 45 departs from the main requirements of IAS 16[2] or where the IPSASB considered further guidance is needed to enhance consistent application of principles to address a prevalent public sector specific issue.

BC12. When developing this Standard, the IPSASB decided to relocate IPSAS 17 guidance that supports core principles to the application guidance, generic measurement guidance to IPSAS 46, *Measurement*, and add guidance for accounting for heritage assets and infrastructure assets in scope of the Standard. Responses received to ED 78 did not identify information the IPSASB had not previously considered or a public sector specific issue or challenge when applying the structure or principles in IPSAS 45.

Scope

Remove the Heritage Scope Exclusion Paragraphs

BC13. The IPSASB concluded that the principles in IPSAS 45 should fully apply to heritage assets and decided to remove the scope exclusion for heritage assets, on the basis that:

(a) Recognition of heritage assets will increase the transparency of heritage-related financial information so that users are better able to hold entities accountable for their heritage-related decisions, particularly those that support heritage preservation;

(b) Their heritage nature does not prevent heritage items being assets for financial reporting purposes;

(c) Many heritage items are assets and should be recognized in the statement of financial position when they meet the IPSAS 1, *Presentation of Financial Statements* recognition criteria of an asset;

(d) Since the heritage nature of an item is not, by itself, a reason for special financial reporting requirements, a separate heritage focused IPSAS is unnecessary; and

(e) Where heritage items are within the scope of another IPSAS, that Standard should apply (for example, IPSAS 31, *Intangible Assets* should be applied for heritage assets that are intangible in nature).

Move List of Property, Plant, and Equipment to Application Guidance

BC14. The IPSASB noted that the list of different types of property, plant, and equipment included in the scope of IPSAS 17 was more in the nature of application guidance than that of principles to be included in core text. On this basis, the IPSASB had decided that the list and related descriptions should be moved to the application guidance.

Definition of Property, Plant, and Equipment

Definition of Property, Plant, and Equipment

BC15. The IPSASB had noted that the definition of property, plant, and equipment in IPSAS 17 referred to 'tangible items' instead of 'tangible assets' and that a strict application of this definition could lead to the recognition of an item that did not meet the definition of an asset in IPSAS 1 *or* the *Conceptual Framework*[3]. The lack of

[2] The IASB's Bases for Conclusions are not reproduced here. Subscribers to the IASB's Comprehensive Subscription Service can view the Bases for Conclusions on the IASB's website at http://www.iasb.org.

[3] An asset is defined in *The Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities* (the Conceptual Framework) and IPSAS 1, *Presentation of Financial Statements* and contains three common components: resource(s), control and past event.

reference to ‘asset’ caused confusion in practice because there are instances when it is uncertain whether an item is a resource or it is controlled by the entity. To address the uncertainty, the IPSASB had decided to:

(a) Replaced the term “tangible items” with “‘tangible assets,” in the definition of property, plant, and equipment (see paragraph 5);

(b) Added authoritative guidance on resource and control (see paragraphs AG9 and AG10-AG11 respectively); and

(c) Added non-authoritative implementation guidance and illustrative examples on control (see paragraphs IG1-IG8 and IE1-IE5 respectively).

BC16. One of the responses received to ED 78 noted that paragraphs AG8-AG15 of ED 78 were a duplication of content found in the *Conceptual Framework* and suggested removing the content and instead, make a cross-reference to the *Conceptual Framework*. The IPSASB discussed that this authoritative guidance was added to ED 78 to ensure consistency of principle application, specifically to help an entity determine whether an item met all three criteria of the definition of an asset, but specifically two of the three criteria of an asset, resource and control. Rather than removing the guidance and adding a cross-reference to the *Conceptual Framework*, the IPSASB decided to keep guidance on the two key topics (i.e., whether a heritage item is a resource and assessment of control for both heritage and infrastructure items).

Characteristics of Heritage and Infrastructure Assets

BC17. The IPSASB had decided neither heritage nor infrastructure assets needed to be defined, because they were subsets of property, plant, and equipment and therefore, the principles in this Standard apply to heritage and infrastructure assets.

BC18. Based on responses to the Heritage CP and constituents’ comments related to infrastructure, the IPSASB had concluded that ED 78 should include application guidance, including specific characteristics of heritage and infrastructure, to help entities identify their heritage assets (see paragraphs AG2-AG3) and infrastructure assets (see paragraphs AG4-AG6) from other property, plant, and equipment. The IPSASB had decided to only include characteristics that distinguished heritage and infrastructure assets from other property, plant, and equipment, and which presented complexities in the application and implementation of the principles in ED 78, as opposed to including an exhaustive list of the characteristics of heritage and infrastructure assets.

BC19. A few responses to ED 78 recommended the IPSASB to expand (a) to reflect that heritage assets also have restrictions on their disposal, which present complexities in the application and implementation of ED 78 principles, specifically on the measurement of heritage assets. The IPSASB agreed that restrictions on the disposal of heritage assets, similarly to restrictions on their use, present complexities in the application and implementation of IPSAS 45 principles, although not a unique characteristic to heritage assets.

BC20. In developing IPSAS 45, the IPSASB decided to expand the characteristics for heritage assets and to retain the characteristics for infrastructure assets from ED 78 in IPSAS 45. Except as noted in BC19, responses to ED 78 on heritage and infrastructure assets characteristics did not identify information the IPSASB had not previously considered or a public sector specific issue or challenge when applying the principles in IPSAS 45.

BC20A During the development of IPSAS 51, *Tangible Natural Resources Held for Conservation*, the IPSASB decided to amend the description of heritage assets to better distinguish between heritage assets which are not naturally occurring and naturally occurring heritage assets held for conservation. As a result, the description of heritage assets in paragraph AG2 was amended to remove the references to environmental and natural features.

Recognition

Deemed Cost of Non-Exchange Transactions

BC21. When developing ED 78, the IPSASB decided to replace the terminology of 'fair value' on the initial measurement of a non-exchange transaction of an item or property, plant, and equipment with 'deemed cost'. This was proposed for alignment with the initial measurement principles in IPSAS 46.

BC22. A response to ED 78 suggested a definition of deemed cost be included in IPSAS 45. The IPSASB discussed that deemed cost for assets acquired in a non-exchange transaction is fair value, in accordance with IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards.* The IPSASB noted that ED 78's proposal added unintended complexity as it now required an entity to review IPSAS 33, *First-Time Adoption of Accrual Basis International Public Sector Accounting Standards* to understand which measurement basis to apply for deemed cost of a non-exchange transaction at recognition. However, the proposal was not intended to change the initial measurement of Plant, Property, and Equipment acquired in a non-exchange transaction.

BC23. Following the development of current operational value in IPSAS 46, the IPSASB discussed how to measure 'deemed cost' and concluded that fair value or current operational value are appropriate. The IPSASB further decided the guidance on deemed cost would be included in IPSAS 46.

Weapons Systems

BC24. When IPSAS 17 was revised as a result of Part III of *Improvements to IPSAS 2015,* the IPSASB had considered that Government Finance Statistics (GFS) reporting guidelines use the term "weapons systems" to comprise items that are used continuously in the provision of defense services, even if their peacetime use is simply to provide deterrence. At that time, the IPSASB had concluded that replacing the IPSAS term "specialist military equipment" with the GFS term "weapons systems" and including a description would clarify the applicability of IPSAS 17 while increasing consistency with GFS reporting guidelines. In developing IPSAS 45, the IPSASB concluded that the same principles should apply and continued to use the term "weapons systems" with a description (see paragraph AG7).

Heritage Assets: The Operational/Non-Operational Distinction

BC25. The IPSASB had considered whether only those heritage assets that are used for non-heritage purposes, called "operational" heritage assets, should be recognized. Operational heritage assets include, for example, a heritage bridge that functions as a bridge or a heritage railway station that is used as a railway station. Some national jurisdictions use the term "non-operational" to describe heritage assets that are used purely for heritage purposes. For example, museum collections held for public appreciation are non-operational heritage assets. Some constituents argued that non-operational heritage assets should not be recognized.

BC26. However, the IPSASB had concluded that both operational and non-operational heritage items can be assets, since both can meet the IPSAS 1's definition of an asset (resource, control, past event). On this basis, the IPSASB had decided that the distinction is not relevant to a decision on whether or not to recognize a heritage item as an asset.

Spare Parts for Infrastructure Assets

BC27. The IPSASB considered whether ED 78 provided sufficient guidance on the accounting treatment of spare parts for infrastructure assets. The IPSASB had concluded that accounting for spare parts is a generic issue and that sufficient authoritative guidance existed in ED 78 for infrastructure asset spare parts that meet the definition of property, plant, and equipment, and in IPSAS 12, *Inventories* for spare parts that meet the definition of inventory.

Capitalization Thresholds

BC28. The IPSASB considered the issues identified by constituents with respect to establishing capitalization thresholds for costs related to infrastructure assets. The IPSASB had concluded that this issue applies broadly to property, plant, and equipment, and that any guidance should also apply broadly, and not be restricted to applying only to infrastructure assets.

BC29. The IPSASB had noted that this issue is generally considered to be a practical issue that is best addressed by management. Entities' management consider their specific assets holdings, and apply the need to meet users' information needs, materiality, and cost-benefit. However, the IPSASB concluded that there is scope for guidance on the factors for consideration when entities set their capitalization thresholds. On this basis, the IPSASB decided to add implementation guidance (see paragraphs IG10-IG14) on the factors to consider when establishing capitalization thresholds for property, plant, and equipment.

Disclosures Related to Unrecognized Heritage Property, Plant, and Equipment

BC30. When developing ED 78, the IPSASB had considered the issues identified by constituents with respect to disclosures related to unrecognized heritage assets. Being able to measure an asset in a way that achieves the qualitative characteristics and takes account of the constraints on information included in General Purpose Financial Statements (GPFSs) is necessary for recognition of an asset in the financial statements. ED 78 stated, in paragraph 6, that property, plant, and equipment must be measured reliably to be recognized. The IPSASB had agreed with constituents that heritage assets may present measurement difficulties which prevent their recognition, but that information on such assets could be important to meet users' needs.

BC31. In considering the need for additional disclosures when heritage property, plant, and equipment is not recognized, the IPSASB had noted that, as explained in the *Conceptual Framework*, disclosures in the notes to the financial statements:

(a) Can provide information on elements that cannot be measured in a manner that achieves the qualitative characteristics sufficiently to meet the objectives of financial reporting;

(b) Are appropriate when knowledge of the item is relevant to the evaluation of the net financial position of the entity and therefore meets the objectives of financial reporting; and

(c) May include items that do not meet the recognition criteria but are important to an understanding of the entity's finances and ability to deliver services.

BC32. The IPSASB had noted that there were cases where the cost or current value of heritage property, plant, and equipment was not able to be measured reliably and therefore, the assets could not be recognized. Information about the contribution of such assets to the delivery of the entity's objectives would nonetheless be useful to users of the financial statements.

BC33. The IPSASB had decided to include a requirement for additional disclosures on heritage property, plant, and equipment that is not recognized because it cannot be measured reliably on the basis that such information contributes to:

(a) Achievement of the objectives of financial reporting; and

(b) Users' understanding of the entity's finances and ability to deliver services for accountability and decision-making purposes.

Therefore, ED 78 included paragraph 77, which established that additional disclosures were required, and application guidance for such disclosures was added in paragraphs AG37-AG38.

BC34. Responses to ED 78 requested for the disclosure requirement to be expanded to either infrastructure assets or to all property, plant, and equipment that is not recognized because it cannot be measured reliably. The IPSASB noted that measurement challenges, which prevent recognition of a tangible asset, were specific to heritage assets.

BC35. In developing IPSAS 45, the IPSASB decided to retain the ED 78 proposal in IPSAS 45 because the responses received to ED 78 did not identify information the IPSASB had not previously considered or a public sector specific issue or challenge when applying the principles in IPSAS 45.

Treatment of Subsequent Expenditure on Unrecognized Heritage Assets

BC36. The IPSASB considered constituents' views on additional guidance on decisions to capitalize or expense subsequent expenditure on unrecognized heritage assets. The IPSASB concluded that there is sufficient authoritative guidance addressing heritage-related concerns. The IPSASB's decision to not have a heritage scope exclusion in ED 78, resulted in the Standard's authoritative guidance fully applying to heritage assets. Therefore, heritage assets that satisfy the recognition criteria shall be recognized. Given measurement difficulties associated with heritage assets, however, the IPSASB acknowledged that some heritage assets may not be able to be recognized. The IPSASB decided that application guidance should be added (see paragraph AG20) to establish that paragraph 6's principles apply to the recognition of subsequent expenditure on unrecognized heritage assets. The IPSASB further decided to include additional implementation guidance (see paragraph IG9), which is needed to support decisions on when to capitalize or expense subsequent expenditure on unrecognized heritage property, plant, and equipment.

Measurement

Measurement of Heritage Assets

BC37. The IPSASB received requests for additional non-authoritative guidance for the recognition and measurement of heritage assets. The IPSASB decided to add implementation guidance, which walks an entity through the recognition criteria, in paragraph 6, and includes initial measurement considerations to help an entity in the recognition and measurement of heritage assets.

Initial Measurement

BC38. A response to ED 78 noted a cross reference to ED 77, *Measurement* on initial measurement stating an entity shall apply ED 77 when measuring an item of property, plant, and equipment. The respondent asked the IPSASB to clarify the scope of each standard and on the terminology differences for initial measurement between ED 78 and ED 77, 'at cost' and 'at transaction price' respectively.

BC39. The IPSASB discussed that terminology in IPSAS 45 was carried forward from IPSAS 17, to reflect continued alignment with IAS 16 terminology and that this core principle from IPSAS 17 remains unchanged. Additionally, the IPSASB noted that ED 78 contained specific initial measurement guidance (see paragraph 11) and guidance in ED 77 is generic, therefore not developed to replace existing detailed guidance in any specific IPSAS.

BC40. In developing IPSAS 45, the IPSASB decided to:

(a) Retain IPSAS 17 terminology 'at cost' for initial measurement;

(b) Remove the cross reference from IPSAS 45, *Property, Plant, and Equipment* to IPSAS 46 on initial measurement of property, plant, and equipment to remove the circularity between these standards; and

(c) Revise paragraph 5 in IPSAS 46 to reflect that when specific guidance on initial and subsequent measurement is included in an individual IPSAS, such guidance shall be applied.

Elements of Cost

Costs to Dismantle Infrastructure Assets

BC41. The IPSASB considered whether sufficient guidance existed for accounting for costs to dismantle infrastructure assets when there is a need to highlight the impact of the future environmental or decommissioning costs on the value of acquired property, plant, and equipment, including infrastructure assets.

BC42. The IPSASB decided that this issue was not specific to infrastructure assets, and no additional guidance was necessary, because sufficient authoritative guidance existed in:

(a) ED 78 that stated that the cost of an item of property, plant, and equipment included the initial estimate of the costs of dismantling and removing the item and restoring the site on which it is located; and

(b) IPSAS 19, *Provisions, Contingent Liabilities and Contingent Assets* that requires a public sector entity to recognize a provision for decommissioning costs to the extent that the public sector entity is obliged to rectify damage already caused.

Subsequent Measurement

Accounting Policy Choice

BC43. The IPSASB considered whether additional guidance was necessary to assist in making the accounting policy choice of subsequently measuring classes of property, plant, and equipment either on a historical cost or current value model.

BC44. The IPSASB concluded no additional guidance was needed. Management should continue to apply its judgment in choosing an accounting policy that results in information that:

(a) Is relevant to the accountability and decision-making needs of users;

(b) Faithfully represents the financial position, financial performance, and cash flows of the entity;

(c) Meets the qualitative characteristics of understandability, timeliness, comparability, and verifiability; and

(d) Considers the constraints on information included in GPFSs and the balance between the qualitative characteristics.

Current Value Model

Measurement Bases

BC45. During the development of IPSAS 46, the IPSASB had considered concerns raised by respondents with regard to the application of fair value in the public sector. While respondents agreed fair value was applicable in some circumstances, they raised concerns about its applicability to public sector assets held for their operational capacity. Respondents suggested it was inappropriate to apply fair value to those assets because the following concepts are not applicable:

(a) Highest and best use; and

(b) Maximizing the use of market participant data.

BC46. The IPSASB had decided to address respondents' concerns by developing a public sector specific measurement basis – Current Operational Value. This measurement basis addressed the measurement of assets held for their operational capacity.

BC47. When developing ED 78, the IPSASB had proposed that when an entity chooses the current value model as its accounting policy for a class of property, plant, and equipment, it should have the option of measuring that class of assets either at current operational value or fair value.

BC48. Some responses to ED 78 raised concerns about basing the measurement basis on management's intent, particularly as it will reduce the comparability of financial statements and reduce consistency of principle application. These respondents were of the view that the selection between measurement bases should be driven by facts and circumstances, such as the reason why the asset is held, and that a change between measurement bases is only appropriate when there is a change in the primary objective for which the entity holds the asset.

BC49. Other responses to ED 78 requested additional non-authoritative guidance on when a change between current value measurement bases was appropriate and how to make the selection between measurement bases, as it may be difficult to determine whether an asset is held for operational or financial capacity (for example, a mixed-use office building) if the measurement bases are applied to an entire class of property, plant, and equipment.

BC50. The IPSASB acknowledged that current operational value was developed to address a public sector specific need for a measurement basis that was more representative of the current value of assets held for their operational capacity in the public sector. The IPSASB further discussed, as noted in (a) and (b), that it was inappropriate to apply fair value concepts of 'highest and best use' and 'maximizing the use of market participant data' for assets held for their operational capacity.

BC51. The IPSASB agreed that it would seem contradictory for the decision of measurement basis in the current value model to be a free choice, considering the guidance included in paragraph 29 and AG26-AG27 of ED 78 and the reason behind the development of current operational value as a measurement basis for public sector assets held for their operational capacity.

BC52. The IPSASB also discussed whether the measurement bases should be applied to an entire class of property, plant, and equipment or whether it should be applied at the item or part of an item of property, plant, and equipment level, taking into consideration mixed-use assets (BC49). Additionally, the IPSASB considered whether a cross reference from IPSAS 45 to IPSAS 46 was needed to help entities on the selection of current value measurement bases.

BC53. The IPSASB concluded that

(a) An item or part of an item of property, plant, and equipment held for its operational capacity shall be measured at its current operational value, and when it is held for its financial capacity, it shall be measured at fair value (see paragraph 27);

(b) Deemed cost could be measured using either current operational value or fair value;

(c) While measurement models are to be applied to an entire class of property, plant, and equipment, the measurement bases are to be applied to an item or part of an item of property, plant, and equipment (see paragraphs 27-28, AG20-AG23 and IG15);

(d) To include additional implementation guidance on when a change between current value measurement bases is appropriate (see paragraphs IG16-IG17); and

(e) A cross reference from IPSAS 45 to IPSAS 46 is not necessary because application guidance on whether property, plant, and equipment is held for operational or financial capacity is included in this Standard (see paragraphs AG20-AG23).

Current Value Measurement of Heritage Assets

BC54. The IPSASB considered constituents' views on the need for guidance on application of the current value model to heritage assets. The IPSASB decided that additional implementation guidance is needed on measurement at current value when heritage assets are viewed as irreplaceable, and have restrictions on their use to ensure consistent application and implementation of this Standard's principles (see paragraphs IG19-IG22).

Valuing Land Under or Over Infrastructure Assets

BC55. The IPSASB considered whether existing guidance in IPSAS 17 addressed the approach to valuing land under or over infrastructure assets such as land under roads and railways.

BC56. The IPSASB decided to add non-authoritative implementation guidance to this Standard to clarify the existing principles related to the valuation of land under or over infrastructure assets (see paragraphs IG23-IG25).

Depreciation

Finite and Indefinite Useful Lives

BC57. When developing this Standard, the IPSASB noted that generally, land has an indefinite useful life and therefore, is not depreciated. Exceptions, where land should be depreciated include:

(a) Land is being consumed due to depletion (such as mines and quarries or landfill sites); or

(b) Land is being lost or displaced as a result of natural phenomena such as climate change (for example, rock or soil erosion, or desertification).

BC58. The IPSASB decided that the IPSAS 17 discussion of useful lives should be revised to better address situations where land has a finite useful life and should be depreciated (see paragraphs 52-55). During its consideration of this issue and those raised by heritage assets' useful lives, the IPSASB decided that the terminology of finite and indefinite useful lives, as used in IPSAS 31, should be used in ED 78. This provided consistent terminology across IPSAS when considering useful lives for asset depreciation.

BC59. The IPSASB further decided that the revised core text and related application guidance should also provide guidance to address situations where items of property, plant, and equipment (e.g., heritage assets, discussed further below) could have indefinite useful lives and therefore, should not be depreciated.

BC60. The IPSASB considered that most non-land property, plant, and equipment have finite useful lives. On this basis, the IPSASB decided to include a rebuttable presumption that non-land property, plant, and equipment has a finite useful life, so that an entity must have evidence to rebut that presumption before it can treat non-land property, plant, and equipment as having an indefinite useful life (see paragraph 52).

Depreciation of Heritage Assets

BC61. When developing ED 78, the IPSASB had concluded based on responses to the CP, *Financial Reporting for Heritage in the Public Sector*, that the same depreciation requirements applied to other types of property, plant, and equipment shall apply to heritage assets. Where respondents disagreed with that approach, some argued against depreciation, while others stated that guidance was needed on how to estimate heritage assets' useful lives and identify heritage assets for which there is no depreciation expense. On the basis that

many heritage assets were consumed over time, as they delivered services and/or economic benefits, the IPSASB had concluded that heritage assets can be depreciable assets.

BC62. However, the IPSASB had further concluded that heritage assets may have very long and even indefinite useful lives, due to factors such as their nature and/or the circumstances in which they were held. On this basis, the IPSASB had decided that useful lives should be clarified to apply to situations where property, plant, and equipment have indefinite useful lives.

BC63. To support entities' assessments of whether a heritage asset has a finite or indefinite useful life, the IPSASB had decided to add non-authoritative implementation guidance (see paragraphs IG30-IG33).

Identifying Parts of Infrastructure Assets that Should Be Separately Depreciated

BC64. The IPSASB considered whether it was a challenge to determine the appropriate unit of account when identifying significant parts of infrastructure assets that should be separately depreciated.

BC65. The IPSASB noted the existing principles are clear that an asset could have different units of account for depreciation because parts of an item of property, plant, and equipment with a significant cost in relation to the total cost of the item shall be depreciated separately. This principle holds true for infrastructure assets, but judgment needs to be exercised in determining or identifying the units of account, which may be separate assets in their own right (see paragraph 8).

BC66. The IPSASB decided to revise the example in paragraph AG6 which listed a number of assets (such as curbs and channels, pavements and bridges) that make up the road system as the units of account or parts that should be identified for separate recognition and depreciation to illustrate the principle of depreciating separately the parts of items of property, plant, and equipment at the appropriate level.

BC67. The IPSASB acknowledged that the separate units of account described in the example may be relevant in some jurisdictions but considered that jurisdictions will apply judgment in determining the appropriate units of accounts for their circumstances.

BC68. The IPSASB decided to add implementation guidance (see paragraphs IG34-IG38).

Annual Impairment Tests for Property, Plant, and Equipment with Indefinite Useful Lives

BC69. The IPSASB had decided that where an entity has assessed property, plant, and equipment as having indefinite useful lives it is important that the assets be reviewed regularly for indicators of impairment. On this basis the IPSASB decided to insert a requirement for annual reviews for indicators of impairment applied to such assets into ED 78 (see paragraph 56.

Separately Accounting for Land and Infrastructure Assets

BC70. The IPSASB considered the issue of whether land and infrastructure assets are separate assets that should be separately accounted for.

BC71. The IPSASB decided that no additional authoritative guidance should be included in ED 78 because the guidance is clear that:

(a) Land and buildings are separable assets and are accounted for separately (e.g., separate recognition and measurement) even when they are acquired together (see paragraph 50); and

(b) Land, buildings, roads and electricity transmission networks are examples of separate classes of property, plant, and equipment that should be separately disclosed (see paragraphs 34 and 69).

Renewals Accounting

BC72. The IPSASB considered whether "renewals accounting" was an appropriate technique to estimate depreciation of property, plant, and equipment when these are managed in accordance with a detailed asset management plan.

BC73. The IPSASB concluded there is no definitive "renewals accounting" method and that this technique should not be used in its literature to estimate depreciation of property, plant, and equipment given the numerous interpretations across different jurisdictions.

Use of Information in Asset Management Plans for Financial Reporting

BC74. When developing this Standard, the IPSASB had noted that many public sector entities have asset management plans that facilitate the proper management of an item of property, plant, and equipment over its life cycle. These asset management plans are usually developed by qualified experts and focus on the operational aspects of the item of property, plant, and equipment.

BC75. The IPSASB noted that, where these asset management plans are kept up to date by qualified experts and the information is reliable, these plans could provide detailed information relevant for accounting for property, plant, and equipment.

BC76. The IPSASB decided to add implementation guidance to clarify when asset management plans might provide information useful for financial reporting purposes when accounting for property, plant, and equipment (see paragraphs IG39-IG40).

Impairment

Liabilities for Future Preservation/Maintenance of Heritage and Infrastructure Assets

BC77. When developing this Standard, the IPSASB considered whether an entity's intention to preserve and/or maintain heritage and infrastructure assets could give rise to liabilities. For a liability to exist the entity must have an unavoidable present obligation (i.e. little or no realistic alternative to avoid) to incur future expenditure to an external party.

BC78. While acknowledging that entities who hold heritage and infrastructure assets often intend to preserve and/or maintain them and there may be expectations on the entity to do so, the IPSASB concluded that neither intentions nor expectations are sufficient to establish a present obligation.

BC79. The IPSASB concluded no liability arises from the entity's plan and/or intention to preserve and/or maintain heritage and infrastructure assets, unless there were arrangements in place that create an obligation to an external party for the entity.

Impairment of Heritage and Infrastructure Assets

BC80. The IPSASB considered if sufficient guidance existed on whether an infrastructure asset is impaired when one part of the network or system becomes damaged or inoperable. The IPSASB also considered whether additional guidance is needed to address the impairment of heritage assets.

BC81. The IPSASB decided no additional guidance is necessary because sufficient authoritative impairment guidance exists in IPSAS 21, *Impairment of Non-Cash-Generating Assets*, and IPSAS 26, *Impairment of Cash-Generating Assets*, to adequately address the impairment of both heritage and infrastructure assets, including guidance for entities to determine when a part of the network or system was impaired.

Under-Maintenance of Assets

BC82. The IPSASB considered the issue that guidance did not articulate whether “backlog maintenance” or “deferred maintenance” should be recognized in the financial statements.

BC83. The IPSASB had decided not to use the terms, “backlog maintenance” or “deferred maintenance” because the terms have several interpretations and applications across different jurisdictions. The IPSASB clarified that the issue highlighted by constituents related to the “under-maintenance of assets”.

BC84. Even though IPSAS 17 principles are clear on the accounting for assets that are “under-maintained”, the IPSASB decided to add implementation guidance to clarify the accounting for “under-maintenance of assets” in ED 78 (see paragraphs IG41-IG44).

Recoverable Amount

BC85. IAS 16 defines recoverable amount as “the higher of an asset’s fair value less costs of disposal and its value in use.” IPSAS 17 refers to the IPSAS 26 definition of recoverable amount which is defined as “the higher of an asset’s or cash generating unit’s fair value less costs to sell and its value in use.” The definition in IPSAS 17 is the same as in IPSAS 26 but differs slightly from the definition in IAS 16. In developing IPSAS 45*,* the IPSASB noted that this departure from IAS 16 on the definition of recoverable amount is still applicable in IPSAS 45.

Derecognition

Derecognition of Infrastructure Assets

BC86. When developing this Standard, the IPSASB had considered whether sufficient derecognition guidance with respect to accounting for infrastructure assets existed. The IPSASB had noted the derecognition issue arose because parts of infrastructure assets were constantly replaced and there could be a lack of detailed accounting records to support the derecognition of the carrying amounts of the parts that are replaced.

BC87. The IPSASB decided not to add additional derecognition guidance in this Standard because sufficient authoritative derecognition guidance exists and the challenges identified by constituents when accounting for derecognition of parts of infrastructure assets appeared administrative and related to record keeping.

Presentation—Display and Disclosure

Heritage: Focus on Information in the Financial Statements

BC88. When developing this Standard, the IPSASB noted that some jurisdictions disclosed supplementary information about heritage assets as a substitute for recognizing heritage assets in the financial statements. Supplementary disclosures may include qualitative information that is not commonly included in the financial statements. This type of information could be useful for broader accountability purposes such as reporting on an entity’s heritage-related service performance.

BC89. The IPSASB concluded that it would focus on guidance related to the financial statements on the basis that the *Recommended Practice Guidelines* (RPG) provides sufficient guidance for reporting supplementary information about heritage assets outside of the financial statements. The RPG Guidelines allow entities to align heritage-related supplementary information to the specific information needs arising from their heritage holdings, heritage-related objectives, and national or local context.

Transitional Provision

BC90. When developing ED 78, the IPSASB had decided that IPSAS 45 shall be applied retrospectively in accordance with IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*, except that an

entity may elect to measure heritage assets at current value when reliable cost information for these assets was not available. In developing IPSAS 45, the IPSASB acknowledged that an additional transitional provision was needed for the initial application of IPSAS 45 current value measurement bases. The IPSASB decided to include additional authoritative guidance reflecting that rather than restating comparative periods, an entity shall recognize the effect of initially applying current operational value and fair value basis in the current value model as an adjustment to the opening accumulated surplus or deficit at the date of initial application of IPSAS 45 (see paragraph (b)).

Revisions of IPSAS 45 as a result of *Amendments to IPSAS Standards: Specific IFRIC Interpretations*

BC91. In September 2023, the IPSASB initiated a narrow scope project to consider seven IFRIC and SIC Interpretations that were issued by the IFRS Interpretations Committee, but had not yet been considered by the IPSASB, to determine their applicability to the public sector. In its assessment, the IPSASB considered whether public sector entities may face similar application issues, and whether incorporating guidance based on the Interpretations into IPSAS would help clarify the application of existing accounting principles.

BC92. The IPSASB reviewed the requirements of IFRIC 1 *Changes in Existing Decommissioning, Restoration and Similar Liabilities*, first issued by the IASB in 2004, and the IFRS Interpretations Committee's considerations in reaching its consensus as set out in its Basis for Conclusions. The IPSASB generally concurred that there was no public sector specific reason for not incorporating these requirements into IPSAS 19, Provisions, Contingent Liabilities and Contingent Assets.

BC93. In April 2024, the IPSASB published Exposure Draft (ED) 89, *Amendments to Consider IFRIC Interpretations*, which proposed to add guidance to IPSAS 45 to direct users to relevant guidance in IPSAS 19. The IPSASB received strong constituent support for these proposals. Therefore, it decided to amend IPSAS 45 to incorporate the proposed guidance.

Revision of IPSAS 45 as a result of Part 3 of *Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* issued in August 2025

BC94. The IPSASB replaced the term 'valuation techniques' with the term 'measurement techniques' for consistency with the new terminology introduced in IPSAS 46, *Measurement*.

Implementation Guidance

This guidance accompanies, but is not part of, IPSAS 45.

Definition of Property, Plant, and Equipment

Assessment of Control

IG1. **Assessing Control:** An entity controls a resource if it has the ability to use the resource or direct other parties on its use or prevent other parties from using the resource so as to derive service potential or economic benefits embodied in the resource in the achievement of its service delivery or other objectives. Paragraph AG10 identifies the indicators of control as follows:

(a) Legal ownership;

(b) Access to the resource, or the ability to deny or restrict others to access the resource;

(c) The means to ensure that the resource is used to achieve its objectives; or

(d) The existence of an enforceable right to service potential or the ability to generate economic benefits arising from the resource.

IG2. **Control over tangible items**: This implementation guidance focuses on control over items of property, plant, and equipment, where the resource is represented by a tangible item. Intangible assets arising from a loan, lease or other type of "right to use" are not addressed in this implementation guidance because they are outside of IPSAS 45's scope.

IG3. **Apply judgment**: The entity applies judgment to the facts of each situation when:

(a) Assessing the existence of indicators of control; and

(b) Reaching a view on whether or not control exists.

Control of Land Under or Over Property, Plant, and Equipment

Property, plant, and equipment can be built on land that is fundamental to the operation of the item but is owned by another entity. For example, State or Municipal Governments may construct road networks on land that is owned by another level of government. Should the entity that controls the property, plant, and equipment also recognize the land?

IG4. Where an item of property, plant, and equipment is built on land owned by another level of government, legal ownership of that land will not be held by the entity constructing the property, plant, and equipment. However, legal ownership is only one indicator of demonstrating control of a resource. An entity may demonstrate that it controls the resource even when there is no legal ownership because it has the ability to direct the use of the resource and obtain the economic benefits or service potential that may flow from it.

IG5. When assessing whether land, owned by another level of government, under an item of property, plant, and equipment is controlled by the entity, the entity considers the rights it has to continue to operate the item of property, plant, and equipment. If the ongoing operation of the item of property, plant, and equipment is dependent on the other level of government continuing to grant the entity access to the land, it is unlikely the entity controls the land.

Control over Items in a Heritage Collection

Does an entity have control over items in its heritage collection, when it only has the right to hold the items temporarily, for a defined period under an agreement (or agreements) with another entity (or entities) or individual (group of individuals)?

IG6. No. The entity does not have control over these items in its heritage collection. Applying the application guidance in IPSAS 45 and judgment to the facts of the situation the entity does not have control over the resource represented by the items. This is indicated by the entity only holding the item temporarily, for a defined period. The entity does not have the ability to use the items or direct other parties on their use or prevent other parties from using the items so as to derive service potential or economic benefits embodied in the items in the achievement of its service delivery or other objectives. However, another Standard could apply, for example one that addresses leases or similar arrangements, which includes intangible rights to use a tangible resource within its scope.

Does an entity have control over items in its heritage collection, when it does not have legal ownership but has the right to hold the items for an indefinite period through an arrangement that both parties to the agreement understand to be open-ended?

IG7. Yes. The entity has control over these items in its heritage collection. This is because it has the ability to use the items or direct other parties on their use or prevent other parties from using the items so as to derive service potential or economic benefits embodied in the items in the achievement of its service delivery or other objectives.

Does an entity retain control over items in its heritage collection if it holds them in storage, instead of displaying them to the public?

IG8. Yes. The entity still controls items in its heritage collection when it holds them in storage (for example, in a warehouse or research laboratory) instead of displaying them to the public. The entity's decision to hold the items in storage does not affect the entity's control over the resource represented by the items. This is because it has the ability to use the items or direct other parties about their use or prevent other parties from using the items so as to derive service potential or economic benefits embodied in the items in the achievement of its service delivery or other objectives.

Recognition

Treatment of Subsequent Expenditure on Unrecognized Heritage Assets

Should an entity capitalize subsequent expenditure on an unrecognized heritage asset when the expenditure meets IPSAS 45's recognition principle?

IG9. Yes. A reporting entity should capitalize subsequent expenditure that it incurs on an unrecognized heritage asset where that expenditure meets IPSAS 45 recognition principle in paragraph 6.

Capitalization Threshold for Costs

What factors should be considered when choosing a capitalization threshold?

IG10. IPSAS 45 paragraph 6 establishes the recognition principle for determining whether costs should be recognized as an asset, i.e., "capitalized" and states that the cost of an item of property, plant, and equipment shall be recognized as an asset if, and only if:

(a) It is probable that future economic benefits or service potential associated with the item will flow to the entity; and

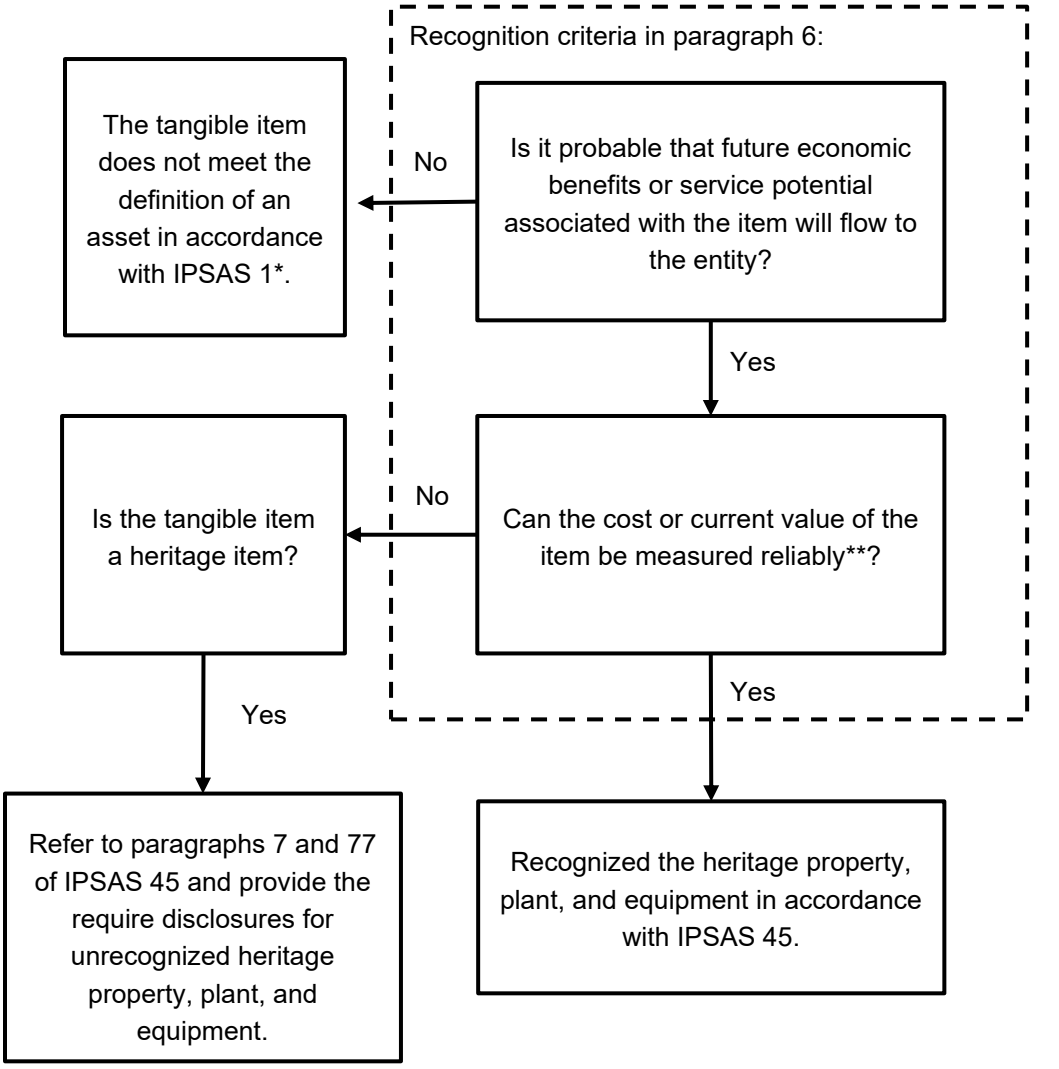
(b) The cost or current value of the item can be measured reliably.

IG11. In practice, entities expense some costs that meet this recognition principle, because they fall below a "capitalization threshold," established by management. Capitalization thresholds assume application of the materiality principle. As such, not all property, plant, and equipment with useful lives extending beyond a single reporting period will be capitalized. Many can be expensed without having a material impact on the information reported in the financial statements. Capitalization thresholds guide entities on whether costs should be capitalized and included in the statement of financial position or expensed and included in the statement of financial performance.

IG12. Factors to consider when setting capitalization thresholds include:

(a) **Meeting the information needs of primary users**: Capitalization thresholds should result in reported information that meets the needs of primary users of the financial statements. Capitalization thresholds should result in reported amounts for recognized assets that achieve the qualitative characteristics, including relevance and representational faithfulness.

(b) **Materiality**: Capitalization thresholds should be such as to ensure that material asset values are captured. Appropriate capitalization thresholds guide entities to capitalize items that would materially impact the information about assets and expenses in the financial statements, and expense those items that would not materially impact that information.



(c) **Cost-benefit**: When capitalization thresholds are set at appropriate levels, they reduce the cost of tracking large numbers of small-value items, while still conferring the benefits of meeting primary users' needs and capturing material values. If a capitalization threshold is set too low, this could create significant additional costs – in the form of work for staff – without any benefit.

IG13. An entity should consider whether different classes of property, plant, and equipment need different capitalization thresholds.

IG14. Capitalization thresholds are often applied to individual items rather than to groups of similar items. However, the cumulative effect on a group of similar assets should be considered when relevant. This may be the case when a group of assets are acquired at the same time as part of a single project, for example assets acquired for an extensive building program.

Decision Tree – Heritage Item

This decision tree accompanies, but is not part of, IPSAS 45.

* **Assets** are resources controlled by an entity as a result of past events and from which future economic benefits or service potential are expected to flow to the entity.

**** Measurement Considerations:**

- Cost as described in paragraphs 14-19.
- Current value:
  - Current operational value: The amount the entity would pay for the remaining service potential of an asset at the measurement date.
  - Fair value: The price that would be received to sell an asset in an orderly transaction between market participants at the measurement date.
- Reliable information: Information that is free from material error and bias and can be depended on by users to faithfully represent that which it purports to represent or could reasonably be expected to represent.

Subsequent Measurement

Current Value Model

Measurement Bases

Can a class of property, plant, and equipment measured using the current value model mix current operational value and fair value measurement bases?

IG15. Yes. The measurement model, i.e., historical cost model or current value model, must be applied consistently to an entire class of property, plant, and equipment. As long as the measurement model is applied to an entire class of property, plant, and equipment, different measurement bases can be applied within the class. This may occur when a class of property, plant, and equipment is measured using the current value model. Individual items within this class of property, plant, and equipment may be measured at current operational value or fair value depending on the primary objective for which an entity holds an item, or part of an item, of property, plant, and equipment. (See paragraph 27).

Is a change in current value measurement basis, from current operational value to fair value, considered a change in accounting policy in accordance with IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*?

IG16. No. The current value measurement basis may change because of a change in the objective for which an entity holds an item or part of an item of property, plant, and equipment.

IG17. For example, a public hospital has ten wards, nine of which have been used for fee-paying patients on a commercial basis, while the tenth ward was used for non-fee-paying patients, The entity decides to repurpose the tenth ward to fee-paying patients on a commercial basis, changing the objective for which the entity holds the tenth ward from operational capacity to financial capacity. As a result, the entity starts measuring the tenth ward at fair value.

Current Value Measurement of Heritage Assets

Do restrictions on the use of heritage assets affect an entity's ability to derive its current value either on initial recognition (if, for example, the asset is donated), or subsequently (when the entity subsequently revalues its heritage assets)?

IG18. No. Restrictions on the use of heritage assets do not affect an entity's ability to derive current values for them. However, restrictions will need to be taken into account when deriving a current value.

Where a heritage asset is viewed as irreplaceable, does this affect an entity's ability to derive its current value?

IG19. No. A view that a heritage asset is irreplaceable does not affect an entity's ability to derive a current value.

IG20. Many heritage assets are viewed as irreplaceable from a heritage perspective. From a financial reporting perspective, the ability to derive a current value involves the ability to ascertain values for equivalent assets. "Equivalent assets" do not have to be identical assets when deriving a current value. Where an entity needs to estimate a current value for a heritage asset, it will need to consider information available on current values, even when, from the perspective of its heritage nature, the asset is irreplaceable. Obtaining current values for heritage assets may be complex and difficult. It could involve judgment to reach an estimate that is derived from a range of possible values. These measurement challenges are a normal part of financial reporting, and not unique to the valuation of heritage assets. The need for professional judgment, expert valuation advice, and/or the use of estimates to derive a current value is not a sufficient basis for concluding that a current value cannot be derived.

IG21. A consideration of the following factors will support an entity's assessment of whether it can derive a current value for a heritage asset:

(a) Replacement of service potential: A current value is likely to be derivable, if the service potential of the heritage asset could be replaced, if necessary, through either:

(i) Purchasing a similar asset; or,

(ii) Reproducing or reconstructing the asset, with reproduction applying to either the whole asset or parts of the asset on either an "as needed" basis or through application of a replacement cycle for the asset.

(b) By contrast, the heritage asset's current value may not be derivable if its service potential cannot be replaced through purchasing another, similar asset or through reproduction.

IG22. Significance of the heritage asset: A current value is likely to be derivable, if the heritage asset's service potential mainly relates to its ability to represent an era or type, such that another heritage asset of the same era or same type could be similarly representative.

By contrast, a heritage asset's current value may not be derivable if its service potential is independent of the heritage asset's ability to represent an era or type and depends, instead, on something unique and specific to that heritage asset.

Valuing Land Under or Over Infrastructure Assets

How should the land under or over infrastructure assets, such as land under roads or railways, be valued because the related infrastructure assets on top of the land are specialized and held for operational capacity?

IG23. IPSAS 45 is clear that:

(a) Land should be separately accounted for. This requirement applies to all land, including land under or over infrastructure assets; and

(b) Land under or over infrastructure assets accounted for under the current value model should be valued at current operational value or fair value. Because the infrastructure asset itself is a specialized asset, it will often be the case that the market approach will be challenging to apply, and that the asset will be more easily valued using the cost approach.

IG24. IPSAS 46, *Measurement* defines the cost approach as a measurement technique that reflects the amount that will be required currently to replace the service capacity of an asset (often referred to as the current replacement cost).

IG25. The replacement cost of the land is based on the current value of the land based on the existing site. For example, if the road runs through agricultural land, then the current value of the land under that section of the road will be agricultural and if the road runs through an industrial area, then the current value placed on the land under that section of the road will be industrial.

Frequency of Revaluation of Property, Plant, and Equipment

How often should property, plant, and equipment be revalued?

IG26. Paragraph 30 of IPSAS 45 specifies that the frequency of revaluations depends upon the changes in current value of the items of property, plant, and equipment being revalued. When the current value of a revalued asset differs materially from its carrying amount, a further revaluation is necessary. The purpose of this guidance is to assist entities that choose the current value model to determine whether carrying amounts differ materially from the current value as at reporting date.

IG27. An entity assesses at each reporting date whether there is any indication that a revalued asset's carrying amount may differ materially from that which would be determined if the asset were revalued at the reporting

date. If any such indication exists, the entity determines the asset's current value and revalues the asset to that amount.

IG28. In assessing whether there is any indication that a revalued asset's carrying amount may differ materially from that which would be determined if the asset were revalued at the reporting date, an entity considers, as a minimum, the following indications:

External sources of information

(a) Significant changes affecting the entity have taken place during the period, or will take place in the near future, in the technological, market, economic, or legal environment in which the entity operates or in the market to which the asset is dedicated;

(b) Where a market exists for the assets of the entity, whether market values are different from their carrying amounts;

(c) During the period, whether a price index relevant to the asset has undergone a material change;

Internal sources of information

(d) Evidence is available of obsolescence or physical damage of an asset;

(e) Significant changes, adverse or favorable, affecting the entity have taken place during the period, or are expected to take place in the near future, in the extent to which, or manner in which, an asset is used or is expected to be used. Adverse changes include the asset becoming idle, or plans to dispose of an asset before the previously expected date, and reassessing the useful life of an asset as finite rather than indefinite. Favorable changes include capital expenditure incurred during the period to improve or enhance an asset in excess of its standard of performance assessed immediately before the expenditure is made; and

(f) Evidence is available from internal reporting that indicates that the economic performance of an asset is, or will be, worse or better than expected.

IG29. The list in paragraph IG28 is not exhaustive. An entity may identify other indications that a revalued asset's carrying amount may differ materially from that which would be determined if the asset were revalued at the reporting date. The existence of these additional indicators would also indicate that the entity should revalue the asset to its current value as at the reporting date.

Depreciation

Heritage Assets' Useful Lives

What are the main factors to consider when assessing whether a heritage asset has an indefinite useful life?

IG30. Paragraph 52 states that there is a rebuttable presumption that non-land property, plant, and equipment have finite useful lives. For a heritage asset to have an indefinite useful life, an analysis of the relevant factors should show that it is reasonable for the entity to consider that there is no foreseeable limit to the period over which it is expected to provide service potential or be used operationally to generate net cash inflows for the entity. Paragraph 54 states that estimates of useful life, at the time the estimate is made, should reflect projections of the relevant factors that are realistic, rather than optimistic or pessimistic.

IG31. Paragraph AG28 states that a heritage painting or sculpture held in a protective environment that is carefully controlled to preserve the asset is an example of an asset that could have an indefinite useful life.

IG32. The main factors to consider when assessing whether a heritage asset has an indefinite useful life are:

(a) **Period providing service potential**: The entity should expect that, to the best of its knowledge, the period over which the heritage asset will continue to provide service potential and/or future economic

benefits will continue indefinitely. The assets' heritage value for future generations should be demonstrable, such that it is reasonable to expect that its heritage value will continue indefinitely.

(b) **Usage**: The usage of the heritage asset should not result in physical wear and tear to the heritage asset.

(c) **Preservation**: The entity should be able to describe the actions it has taken in the past and plans to continue to take to preserve the heritage asset, including adequate protection of heritage assets from the natural elements, where relevant. Preservation plans should include information on the likely availability of staff and financial resources to carry out the entity's preservation activities.

IG33. Entities apply judgment to estimate the useful life of an asset with reference to experience with similar assets. If circumstances change, the entity will need to consider whether the heritage asset still has an indefinite useful life. If the heritage asset is found to have a finite useful life, the entity will then treat it as a depreciable asset and account for it accordingly.

Identifying Parts of Infrastructure Assets that Should be Separately Depreciated

What should be considered when identifying parts of infrastructure asset networks or systems for financial reporting purposes?

IG34. An entity allocates the amount initially recognized in respect of an item of property, plant, and equipment to its significant parts and depreciates separately each part that will have a material impact or effect on determining the annual depreciation expense.

IG35. Property, plant, and equipment including infrastructure assets do not require separate recognition beyond the level required for financial reporting purposes. IPSAS 45 requires:

(a) Items with a cost or value that is significant in relation to the total cost of the item shall be depreciated separately; and

(b) Significant parts of property, plant, and equipment to be grouped with other significant parts that have a similar useful life and / or depreciation method when determining the depreciation charge.

IG36. One of the characteristics of infrastructure assets is that they are networks or systems comprised by a number of assets. Each of those assets or groups of similar assets may be a separate unit of account and may have parts.

IG37. Judgment is required in determining whether those parts of the assets or similar group of assets that make up the infrastructure asset networks or systems are significant in relation to the whole infrastructure asset network or system when determining whether or not to treat them separately. For financial reporting purposes, the following indicators can be helpful in identifying significant parts of an item of property, plant, and equipment:

(a) Parts should be separately identifiable and measurable;

(b) Parts should have significant value in relation to the asset; and

(c) Parts should have different estimated useful lives.

IG38. The entity must consider the facts and circumstances of the transaction as a whole, and materiality to determine the significant parts for the purposes of calculating depreciation.

Use of Information in the Asset Management Plans for Financial Reporting

Can asset management plans provide information useful for accounting for property, plant, and equipment?

IG39. Yes. Information in asset management plans may be used to account for property, plant, and equipment when the items of property, plant, and equipment are maintained in accordance with a sufficiently detailed asset management plan that is subject to effective internal controls and has reliable and up to date information.

IG40. Information from asset management plans can be a useful source of input to:

(a) Calculate depreciation. Paragraphs 47, 57, AG33 and AG35 indicate that depreciation reflects the consumption of the asset's future economic benefits or service potential by allocating the depreciable amount using a systematic basis over its useful life. Asset management plans may contain information on:

(i) The asset's expected useful life - Asset management plans may include information about the expected useful life based on its design/function/expected use; and

(ii) Expected patterns of asset consumption - Asset management plans may include information about the condition and maintenance history;

(b) Determine the significant parts of property, plant, and equipment. Paragraphs 41 and AG24 stipulate that an entity allocates the amount initially recognized in respect of an item of property, plant, and equipment to its significant parts and depreciates separately each part. Asset management plans may include information useful to determine or identify these significant parts of property, plant, and equipment which could in turn be useful to calculate depreciation, impairment, and/or facilitate derecognition of items of property, plant, and equipment;

(c) Calculate the estimated costs to maintain, restore and refurbish assets; and

(d) Determine whether there is an indication that property, plant, and equipment may be impaired. The relevant guidance for impairment is available in paragraph 59 of this Standard and IPSAS 21, *Impairment of Non-Cash-Generating Assets* or IPSAS 26, *Impairment of Cash-Generating Assets*.

Impairment

Under-Maintenance of Assets

What is under-maintenance of assets?

IG41. Under-maintenance of assets occurs when the level of maintenance of an asset is insufficient to maintain the service potential or the useful life of the asset.

Could under-maintenance impact the measurement of items of property, plant, and equipment that require constant maintenance such as infrastructure assets?

IG42. Yes. Under-maintenance may affect the measurement of property, plant, and equipment. It may be an indicator for impairment and may also impact the residual value and useful life of the property, plant, and equipment.

IG43. The relevant guidance for impairment is available in paragraph 59 of this Standard and IPSAS 21 or IPSAS 26. The relevant guidance for assessing the residual value and useful life of property, plant, and equipment is available in paragraphs 48 and 49 of this Standard.

IG44. No liability should be recognized when property, plant, and equipment are not adequately maintained because IPSAS 19, *Provisions, Contingent Liabilities and Contingent Assets* is clear there is no present obligation to recognize maintenance expenses that will be incurred in the future.

Illustrative Examples

These examples accompany, but are not part of, IPSAS 45, Property, Plant, and Equipment.

Definition of Property, Plant, and Equipment

Assessment of Control

Control of Land under or over Property, Plant, and Equipment

Example 1-Case A (see paragraphs IE1-IE3) illustrates the principle to identify the reporting entity that controls the land under a road network where an entity has legal ownership of the land and the right to direct access to the land and to restrict or deny access of others to the land.

IE1. Provincial (State) Government enters into a long-term binding arrangement with the National Government to construct a road that passes through a National Park. The land is legally owned by the National Government and it has the title deeds of the land. The Provincial Government constructs a 200-mile road which connects two of its largest cities, City X and City Y. The road carries buses, cars and goods vehicles between these cities and has significantly shortened travel time between the cities.

IE2. The Provincial Government concludes that the National Government controls the land because the National Government:

(a) Legally owns the land;

(b) Retains all the rights to the land, as it can cancel the binding arrangement at any point in time; and

(c) Retains the ability to generate economic benefits arising from selling the land. The National Government has the right to sell the land at any time and can decide to whom the land can be sold, and at what price.

IE3. While the Province has the ability to ensure that the land immediately below the road is used to achieve its objectives, i.e., the National Government is not receiving any service potential or economic benefit from the land while the road is in use, the entity concludes this is insufficient to support its control of the land. Other indicators support control being retained by the National Government.

Example 1-Case B (see paragraphs IE4-IE5) illustrates the principle to identify the reporting entity that controls the land under a road network where an entity has unlimited and unrestricted use of the land.

IE4. The facts and circumstances remain the same except the land is transferred to the Provincial Government and the latter has unlimited and unrestricted use of the land and does not legally own the land.

IE5. Even though the Provincial Government does not legally own the land, the Provincial Government concludes it controls the land because it:

(a) Has the right to direct access to the land and to restrict or deny access of others to land because it has unlimited and unrestricted use of the land. The Provincial Government can decide how the land will be used;

(b) Has the ability to generate benefits in the form of economic benefits or service potential from the use of the land; and

(c) Ensures the land is used to achieve the Provincial Government’s service potential objective whereby the land will allow the Provincial Government to build a road that will transport vehicles and goods between the two cities.

Disclosures

Example 2 (see paragraph IE6) illustrates the general disclosure principles in paragraph 69-76.

IE6. The Department of the Interior is a public sector entity that controls a wide range of property, plant, and equipment, and is responsible for replacement and maintenance of the property. The following are extracts from the notes to its Statement of Financial Position for the year ended 31 December 20X1 and illustrate the principal disclosures required in accordance with this Standard.

Notes

1. **Land**

   (a) Land consists of twenty thousand hectares at various locations. Land is valued at fair value as at 31 December 20X1, as determined by the Office of the National Valuer, an independent valuer.

   (b) Restrictions on Titles:

   Five hundred hectares of land (carried at 62,500 currency units) is designated as national interest land and may not be sold without the approval of the legislature. Two hundred hectares (carried at 25,000 currency units) of the national interest land and a further two thousand hectares (carried at 250,000 currency units) of other land are subject to title claims by former owners in an international court of human rights and the Court has ordered that the land may not be disposed of until the claim is decided; the Department recognizes the jurisdiction of the Court to hear these cases.

2. **Buildings**

   (a) Buildings consist of office buildings and industrial facilities at various locations.

   (b) Buildings are initially recognized at cost, but are subject to revaluation to fair value on an ongoing basis. The Office of the National Valuer determines fair value on a rolling basis within a short period of time. Revaluations are kept up to date.

   (c) Depreciation is calculated on a straight-line basis over the useful life of the building. Office buildings have a useful life of twenty-five years, and industrial facilities have a useful life of fifteen years.

   (d) The Department has entered into five contracts for the construction of new buildings; total contract costs are 250,000 currency units.

3. **Machinery**

   (a) Machinery is measured at cost less depreciation.

   (b) Depreciation is calculated on a straight-line basis over the useful life of the machine.

   (c) The machinery has various useful lives:

   Tractors: 10 years

   Washing Equipment: 4 years

   Cranes: 15 years

   (d) The Department has entered into a contract to replace the cranes it uses to clean and maintain the buildings – the contracted cost is 100,000 currency units.

4. **Furniture and Fixtures**

   (a) Furniture and fixtures are measured at cost less depreciation.

   (b) Depreciation is calculated on a straight-line basis over the useful life of the furniture and fixtures.

(c) All items within this class have a useful life of five years.

Reconciliations (in '000 of currency units)								
	Land		**Buildings**		**Machinery**		**Furniture and Fixtures**

COMPARISON WITH IAS 16

IPSAS 45, *Property, Plant, and Equipment* is drawn primarily from IAS 16 (issued in December 2003, including amendments up to March 2018), *Property, Plant and Equipment*. The main differences between IPSAS 45 and IAS 16 are as follows:

- IPSAS 45 refers to both “economic benefits” and “service potential”, where appropriate, in the section on recognition of an item of property, plant, and equipment, while IAS 16 refers to “economic benefits”.
- IPSAS 45 at initial measurement requires that an item of property, plant, and equipment acquired through a non-exchange transaction be measured at its deemed cost. IAS 16 does not have such a requirement.
- The subsequent measurement models in IPSAS 45 are historical cost and current value models, while in IAS 16 the models are cost and revaluation.
- IPSAS 45 for subsequent measurement has two measurement bases in the current value model - current operational value and fair value. IAS 16 revaluation model has only one measurement basis - fair value.
- Under IPSAS 45 revaluation increases and decreases are offset within a class of assets basis, while in IAS 16 are offset on an asset basis.
- IPSAS 45 has disclosure requirements for unrecognized heritage assets, while IAS 16 does not have such a requirement.
- IPSAS 45 does not require the disclosure of the equivalent historical cost amounts, where an entity adopts the current value model and carries items of property, plant, and equipment at revalued amounts, while IAS 16 does.
- IPSAS 45 requires the disclosure of the sum of all revaluations, surpluses and deficits for individual items of property, plant, and equipment within that class. IAS 16 does not have such a disclosure requirement.

COMPARISON WITH GFS

In developing IPSAS 45, *Property, Plant, and Equipment*, the IPSASB considered Government Finance Statistics (GFS) reporting guidelines.

Key similarities and differences with GFS are as follows:

- The similarities and differences between the accounting under IPSAS 45 and GFS will depend on the facts and circumstances of the items of property, plant, and equipment.
- Both IPSAS 45 and GFS require an entity to recognize property, plant, and equipment. However, IPSAS 45 uses accounting terminology whereas GFS uses economic terminology, which may have a similar meaning.
- On initial recognition, IPSAS 45 requires measurement at cost or deemed cost where appropriate. As GFS requires the use of market prices, the same valuation can result.
- On subsequent measurement, IPSAS 45 allows historical cost, current operational value, or fair value measurement bases. In GFS, assets should be measured at market values, so the same valuation can result if the market approach is used as the measurement technique.
- In IPSAS 45 current value model increases or decreases in the carrying amount are recognized in net assets/equity or surplus or deficit, as appropriate. In GFS, changes in market value are recognized as other economic flows.
- Both IPSAS 45 and GFS require capitalization of transaction costs. Transaction costs in IPSAS 45 and GFS are presented together with the items of property, plant, and equipment, though ownership transfer costs of land in GFS are presented in land improvements.
- In IPSAS 45, depreciation can be based on historical cost or on current value, whereas consumption of fixed capital in GFS is always based on current value.
- IPSAS 45 includes disclosure requirements that are not present in GFS.

IPSAS 46, *MEASUREMENT*

History of IPSAS Accounting Standard

This version includes amendments resulting from IPSAS Accounting Standards issued up to January 31, 2026.

IPSAS 46, *Measurement* was issued in May 2023.

Since then, IPSAS 46 has been amended by the following IPSAS Accounting Standards:

- IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards* (issued November 2025)
- *Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* (issued August 2025)

Table of Amended Paragraphs in IPSAS 46

Paragraph Affected	How Affected	Affected By
4	Amended	*Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* August 2025
7	Amended	IPSAS 33 November 2025
23	Amended	*Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* August 2025
56A	New	*Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* August 2025
56B	New	*Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* August 2025
56C	New	*Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* August 2025
57	Amended	IPSAS 33 November 2025
B4	Amended	*Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* August 2025
B5	Amended	*Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* August 2025
B6	Amended	*Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* August 2025
B9	Amended	*Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* August 2025
A.2	Amended	*Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* August 2025
B.4	New	*Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* August 2025

Paragraph Affected	How Affected	Affected By
B13	Amended	*Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* August 2025

Basis for Conclusions	
Implementation Guidance	

International Public Sector Accounting Standard 46, *Measurement*, is set out in paragraphs 1–58. All the paragraphs have equal authority. IPSAS 46 should be read in the context of its objective, the Basis for Conclusions, the *Preface to IPSAS Accounting Standards and IPSASB SRS Standards*, and *The Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities*. IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*, provides a basis for selecting and applying accounting policies in the absence of explicit guidance.

Objective

1. **The objective of this Standard is to define measurement bases that assist in reflecting fairly the cost of services, operational capacity and financial capacity of assets and liabilities. The Standard identifies approaches under those measurement bases to be applied through individual IPSAS to achieve the objectives of financial reporting.**

Scope

2. An entity that prepares and presents financial statements under the accrual basis of accounting shall apply IPSAS 46, *Measurement* in measuring assets and liabilities.

3. Except as specified in paragraph 4, this Standard applies when another IPSAS requires or permits:

   (a) One or more of the measurement bases defined in this Standard; and

   (b) Measurements that are based on one or more of the measurement bases (e.g., fair value less costs of disposal).

4. The measurement requirements of this Standard do not apply to the following:

   (a) Leasing transactions accounted for in accordance with IPSAS 43, *Leases*;[1]

   (b) Transactions accounted for in accordance with IPSAS 32, *Service Concession Arrangements: Grantor*; and

   (c) Measurements that have some similarities to the measurement bases in this Standard but are not those measurement bases, such as net realizable value in IPSAS 12, *Inventories* or value in use in IPSAS 26, *Impairment of Cash-Generating Assets* (but this Standard is applied in measuring fair value as required in IPSAS 26).

5. The measurement requirements described in this Standard apply to both initial and subsequent measurement, unless specific guidance is included in the individual IPSAS.

Definitions

6. **The following terms are used in this Standard with the meanings specified:**

   Active market is a market in which transactions for the asset or liability take place with sufficient frequency and volume to provide pricing information on an ongoing basis.

   Cost approach is a measurement technique that reflects the amount that would be required currently to replace the service capacity of an asset (often referred to as current replacement cost).

   Cost of fulfillment is the costs that the entity will incur in fulfilling the obligations represented by the liability, assuming that it does so in the least costly manner.

   Current operational value is the amount the entity would pay for the remaining service potential of an asset at the measurement date.

   Deemed cost is an amount used as a surrogate for transaction price at the measurement date.

   Entry price is the price paid to acquire an asset or received to assume a liability in an exchange transaction.

   Exit price is the price received to sell an asset or paid to transfer a liability.

[1] If this Standard is applied prior to IPSAS 43, *Leases*, the measurement requirements of this standard do not apply to IPSAS 13, *Leases*.

Expected cash flow is the probability-weighted average (i.e., mean of the distribution) of possible future cash flows.

Fair value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date.

Highest and best use is the use of a non-financial asset by market participants that would maximize the value of the asset or the group of assets and liabilities (e.g., an operation) within which the asset would be used.

Historical cost is the consideration given to acquire, construct, or develop an asset plus transaction costs, or the consideration received to assume a liability minus transaction costs, at the time the asset is acquired, constructed or developed, or the liability is incurred.

Income approach is a measurement technique that converts future amounts (e.g., cash flows or revenue and expenses) to a single current (i.e., discounted) amount.

Inputs are the assumptions used when pricing the asset or liability, including assumptions about risk, such as the following:

(a) **The risk inherent in a particular measurement technique used to estimate a measurement in accordance with a measurement basis (such as a pricing model); and**

(b) **The risk inherent in the inputs to the measurement technique.**

Inputs may be observable or unobservable.

Level 1 inputs are quoted prices (unadjusted) in active markets for identical assets or liabilities that the entity can access at the measurement date.

Level 2 inputs are inputs other than quoted prices included within Level 1 that are observable for the asset or liability, either directly or indirectly.

Level 3 inputs are unobservable inputs for the asset or liability.

Market approach is a measurement technique that uses prices and other relevant information generated by market transactions involving identical or comparable (i.e., similar) assets, liabilities or a group of assets and liabilities.

Market participants are buyers and sellers in the principal (or most advantageous) market for the asset or liability that have all of the following characteristics:

(a) **They are independent of each other, i.e., they are not related parties as defined in IPSAS 20, *Related Party Disclosures*, although the price in a related party transaction may be used as an input to a fair value measurement if the entity has evidence that the transaction was entered into at market terms.**

(b) **They are knowledgeable, having a reasonable understanding about the asset or liability and the transaction using all available information, including information that might be obtained through due diligence efforts that are usual and customary.**

(c) **They are able to enter into a transaction for the asset or liability.**

(d) **They are willing to enter into a transaction for the asset or liability, i.e., they are motivated but not forced or otherwise compelled to do so.**

Market-corroborated inputs are inputs that are derived principally from or corroborated by observable market data by correlation or other means.

Most advantageous market is the market that maximizes the amount that would be received to sell the asset or minimizes the amount that would be paid to transfer the liability, after taking into account transaction costs and transport costs.

Non-performance risk is the risk that an entity will not fulfill an obligation. Non-performance risk includes, but may not be limited to, the entity's own credit risk.

Observable inputs are inputs that are developed using market data, such as publicly available information about actual events or transactions, and that reflect the assumptions that market participants would use when pricing the asset or liability.

Orderly transaction is a transaction that assumes exposure to the market for a period before the measurement date to allow for marketing activities that are usual and customary for transactions involving such assets or liabilities; it is not a forced transaction (e.g., a forced liquidation or distress sale).

Principal market is the market with the greatest volume and level of activity for the asset or liability.

Risk premium is the compensation sought by risk-averse market participants for bearing the uncertainty inherent in the cash flows of an asset or a liability. Also referred to as a 'risk adjustment'.

Transaction costs are incremental costs that are directly attributable to the acquisition, construction, development or disposal of an asset, or incurrence of a liability, and would not have been incurred if the entity had not acquired, constructed, developed or disposed of the asset, or incurred the liability.

Transaction price is the consideration given to acquire, construct or develop an asset or received to assume a liability.

Transport costs are the costs that would be incurred to transport an asset from its current location to its principal (or most advantageous) market.

Unit of account is the level at which an asset or a liability is aggregated or disaggregated in an IPSAS for recognition purposes.

Unobservable inputs are inputs for which market data are not available and that are developed using the best information available about the assumptions that market participants would use when pricing the asset or liability.

Terms defined in other IPSAS are used in this Standard with the same meaning as in those Standards, and are reproduced in the *Glossary of Defined Terms* published separately.

Measurement

Initial Measurement

7. **On the date an item qualifies for recognition, it shall be initially measured at its transaction price, plus transaction costs for assets or minus transaction costs for liabilities, unless:**

   (a) That transaction price, plus or minus transaction costs, does not faithfully present relevant information of the entity in a manner that is useful in holding the entity to account, and for decision-making purposes (see paragraphs 10–13); or

   (b) Otherwise required or permitted by another IPSAS.

   When applying accrual basis IPSAS Standards for the first time, initial measurement in an opening statement of financial position at the date of adoption of IPSAS Standards should be carried out in accordance with IPSAS 33, *First-time Adoption of Accrual Basis International Public Sector Accounting Standards*.

Transactions in an Orderly Market

8. When an asset is acquired, constructed, or developed, or a liability is assumed in an orderly market, the transaction price, plus or minus transaction costs, reflects the initial value of the asset or liability negotiated between market participants at the measurement date under current market conditions.

9. Where a transaction price exists, it is presumed to present relevant information on the date the transaction occurred. When determining whether the transaction price presents relevant information about the asset or liability, an entity shall consider factors specific to the transaction and to the asset or liability.

Transactions not Undertaken in an Orderly Market

10. When an asset is acquired, constructed, or developed, or a liability is assumed, as a result of an event that is not a transaction in an orderly market:

    (a) It may not be possible to observe a transaction price;

    (b) The transaction price may not faithfully present relevant information about the asset or liability; or

    (c) The transaction price may be zero.

    In such cases, deemed cost is used to measure the initial value of the asset or liability. A current value measurement basis is used to determine the deemed cost of the asset or liability on initial measurement. Current value measurement bases are described in paragraphs 23–31.

11. Any difference between deemed cost and any consideration given or received would be recognized as revenue or expenses, unless it is a contribution from owners or a relevant IPSAS requires otherwise.

12. Circumstances where a transaction price may not be observable or may not faithfully present relevant information include:

    (a) Transaction prices that have a concessionary element;

    (b) Assets transferred to the entity free of charge by a government or donated to the entity by another party;

    (c) Liabilities imposed by legislation or regulation;

    (d) Liabilities to pay compensation or a penalty arising from an act of wrongdoing or breach of contract;

    (e) Transaction prices that are affected by relationships between the parties, or by financial distress or other duress of one of the parties; and

    (f) Transaction prices that are not available on the date of adoption of IPSAS as defined in IPSAS 33.

13. When assets are acquired, constructed, or developed, or liabilities assumed, as a result of an event that is not a transaction in an orderly market, all relevant aspects of the transaction or other event need to be identified and considered. For example, it may be necessary to recognize other assets, other liabilities, contributions from owners or distributions to owners to faithfully represent the substance of the effect of the transaction or other event on the entity's financial position and any related effect on the entity's financial performance.

Transaction Costs at Initial Measurement

14. Transaction costs related to acquiring, constructing, or developing, an asset or incurring a liability are a feature of the transaction in which the asset was acquired, constructed, or developed, or the liability was incurred. The initial measurement of the asset or liability reflects those transaction costs as the entity could not have acquired, constructed, or developed the asset or assumed the liability without incurring those costs. Transaction costs that could be incurred in selling or disposing of the asset or in settling or transferring a

liability are a feature of a possible future transaction. Unless explicitly required, possible transaction costs are not included because initial measurement reflects the costs of acquiring the asset or incurring the liability.

Transaction Occurring in Stages

15. The acquisition of an asset may occur in stages or may be followed by further expenditures to adapt the asset for the entity's own use. Any expenditures incurred in bringing the asset to the state where it is ready for use will be included in the consideration identified as part of the asset's initial measurement.

Deferred Payments

16. Where the time value of money is material—for example, where the length of time before settlement falls due is significant— the amount of the future cash flows is discounted so that, at the time an asset or liability is first recognized, it represents the value of the amount received or paid. For example, the difference between the amount of the future cash flows and the present value of the asset or liability is amortized over the life of the asset or liability, so that the asset or liability is stated at the amount due to be received, or the required payment when it falls due.

Subsequent Measurement

17. After initial measurement, unless otherwise required by the relevant IPSAS, an accounting policy choice is made to measure an asset or liability on an historical cost basis or a current value basis. This accounting policy choice is reflected through the selection of the measurement model.

Measurement Models

18. Assets and liabilities recognized in financial statements are quantified in historical terms or current terms. This requires the selection of an historical cost or current value measurement model. In selecting a measurement model, an entity shall consider the characteristics of the item, the measurement objective and the monetary information being presented.

Measurement Bases

19. A measurement basis provides information that achieves the qualitative characteristics, as described in the *Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities* (the *Conceptual Framework*) and ensures the constraints on information in GPFRs are considered under the measurement model selected. Applying a measurement basis to an asset or liability creates a measure for that asset or liability and for related revenue and expenses. The selection of a measurement basis depends on the measurement model applied (see diagram after paragraph 36).

20. **When another IPSAS establishes measurement requirements with reference to one or more of the measurement bases below, an entity shall apply the measurement basis in accordance with the requirements and related appendices in this Standard:**

    (a) **Historical cost basis (Appendix A: Historical cost);**

    (b) **Current operational value basis (Appendix B: Current operational value);**

    (c) **Cost of fulfillment basis (Appendix C: Cost of fulfillment); and**

    (d) **Fair value basis (Appendix D: Fair value).**

Historical Cost Basis

21. The historical cost basis is an entry, entity-specific value. The historical cost basis provides monetary information about assets, liabilities and related revenue and expenses, using information derived, at least in part, from the price of the transaction or event that gave rise to them.

22. Following initial measurement, the value of an asset or liability is not remeasured to reflect current conditions or increases in the value of the asset or decreases in the value of the liability.

Current Operational Value Basis

23. Current operational value is an entry, entity-specific amount that the entity would pay for the remaining service potential of an asset in the least costly manner at the measurement date. Current operational value provides monetary information about assets, and related amortization, depreciation, etc., using information updated to reflect conditions at the measurement date. Current operational value therefore reflects changes in the values of assets since the previous measurement date. Similar to fair value and cost of fulfillment, current operational value is not dependent, even in part, on the transaction or event that gave rise to the asset.

24. In some cases, current operational value can be determined directly by observing prices in an active market. In other cases, it is determined indirectly. For example, if prices are available for a similar asset, the current operational value of the entity's asset might need to be estimated by adjusting the current price of the similar asset to reflect the unique aspects of the entity's asset in its existing use and condition.

25. Current operational value differs from fair value because it:

    (a) Is explicitly an entry price and includes all the costs that would necessarily be paid for the remaining service potential of an asset;

    (b) Reflects the value of an asset in its existing use, rather than the asset's highest and best use (for example, a building used as a hospital is measured as a hospital); and

    (c) Is entity-specific and therefore reflects the economic position of the entity.

Cost of Fulfillment Basis

26. Cost of fulfillment is an exit, entity-specific cost that the entity will incur in fulfilling the obligations represented by the liability, assuming that it does so in the least costly manner. Cost of fulfillment is the present value of the cash, or other economic resources, that the entity expects to be obliged to transfer as it fulfills a liability. Those amounts of cash or other economic resources include not only the amounts to be explicitly transferred, but also the amounts that the entity expects to be obliged to transfer to other parties to enable it to fulfill the liability.

27. Cost of fulfillment cannot be observed directly and is determined using cash-flow-based measurement techniques. The cost of fulfillment reflects entity-specific assumptions rather than assumptions used by market participants. In practice, there may be little difference between the assumptions that a market participant would use and those an entity itself uses.

28. The cost of fulfillment reflects the same factors as those reflected in fair value measurement, but from an entity-specific perspective, rather than from a market-participant perspective.

Fair Value Basis

29. Fair value measurement is an exit, market-based measurement that provides monetary information about assets, liabilities and related revenues and expenses, using information updated to reflect conditions at the measurement date. Fair value therefore reflects changes in the values of assets and liabilities since the previous measurement date. The fair value of an asset or liability is not dependent, even in part, on the transaction or event that gave rise to the asset or liability.

30. Fair value reflects the perspective of market participants. The asset or liability is measured using the same assumptions that market participants would use when pricing the asset or liability if those market participants act in their economic best interest.

31. In some cases, fair value can be determined directly by observing prices in an active market. In other cases, it is determined indirectly.

Characteristics of the Asset or Liability

32. A measurement basis is applied to a particular asset or liability. Therefore, when applying the measurement basis, an entity shall take into account the characteristics of the asset or liability at the measurement date (for example, for fair value measurement the characteristics are considered if market participants would take those characteristics into account when pricing the asset or liability). Such characteristics include, for example, the following:

    (a) The condition, use and location of the asset; and

    (b) Restrictions, if any, on the sale or use of the asset.

33. The effect on the measurement arising from a particular characteristic will differ depending on how that characteristic would be taken into account by the entity, for entity-specific measurements, and by market participants, for market-based measurements.

34. The asset or liability measured might be either of the following:

    (a) A stand-alone asset or liability (e.g., a financial instrument or a non-financial asset); or

    (b) A group of assets, a group of liabilities or a group of assets and liabilities (e.g., a cash-generating unit or an operation).

35. Whether the asset or liability is a stand-alone asset or liability, a group of assets, a group of liabilities or a group of assets and liabilities for recognition or disclosure purposes, depends on its unit of account. The unit of account for the asset or liability shall be determined in accordance with the IPSAS that requires or permits the application of one or more measurement bases identified in this Standard, except where specified differently in this Standard.

Measurement Techniques

36. **An entity shall use measurement techniques that are appropriate in the circumstances and for which sufficient data are available to estimate the measurement basis or determine deemed cost.**

    The following diagram sets out the subsequent measurement framework based on the *Conceptual Framework: Chapter 7, Measurement of Assets and Liabilities in Financial Statements*. This diagram illustrates the three levels of measurement and the relationships between them.

37. A measurement technique is applied to estimate the amount at which an asset or liability is recognized under the selected measurement basis or in determining deemed cost (see paragraph 10). Such techniques are not measurement bases. When using such a technique, it is necessary for the technique to reflect the attributes applicable to that measurement basis. For example, if the measurement basis is fair value, the applicable attributes are those described in paragraphs 29–31.

38. Three widely used measurement techniques are the market approach, the cost approach and the income approach. The main aspects of those approaches are summarized in paragraphs 42–45. An entity shall use measurement techniques consistent with one or more of those approaches to measure the asset or liability under the selected measurement basis.

39. In some cases, a single measurement technique will be appropriate (e.g., when valuing an asset or a liability using quoted prices in an active market for identical assets or liabilities). In other cases, multiple measurement techniques will be appropriate (e.g., that might be the case when valuing a cash-generating unit). If multiple measurement techniques are used to measure the asset or liability under the selected measurement basis, the results shall be evaluated considering the reasonableness of the range of values indicated by those results.

40. Measurement techniques shall be applied consistently. However, a change in a measurement technique or its application (e.g., a change in its weighting when multiple measurement techniques are used or a change in an adjustment applied to a measurement technique) is appropriate if the change results in a measurement that is equally or more representative of the measurement basis in the circumstances. That might be the case if, for example, any of the following events take place:

    (a) New markets develop;

    (b) New information becomes available;

    (c) Information previously used is no longer available;

    (d) Measurement techniques improve; or

    (e) Market conditions change.

41. Revisions resulting from a change in the measurement technique or its application shall be accounted for as a change in accounting estimate in accordance with IPSAS 3, *Accounting Policies, Changes in Accounting Estimates and Errors*. However, the disclosures in IPSAS 3 for a change in accounting estimate are not required for revisions resulting from a change in a measurement technique or its application.

Market Approach

42. The market approach uses prices and other relevant information generated by market transactions involving identical or comparable (i.e., similar) assets, liabilities or a group of assets and liabilities.

Cost Approach

43. The cost approach reflects the amount that would be required currently to replace the service provided by an asset (often referred to as current replacement cost) through the acquisition, construction, or development of a substitute asset of comparable utility, adjusted for obsolescence. Obsolescence encompasses physical deterioration, functional (technological) obsolescence and economic (external) obsolescence and is broader than depreciation for financial reporting purposes.

44. The cost of a substitute asset of comparable utility is calculated as the cost of a modern equivalent asset—that is, an asset providing an equivalent service as the existing asset.

Income Approach

45. The income approach converts future amounts (e.g., cash flows or revenue and expenses) to a single current (i.e., discounted) amount. When the income approach is used, the estimate of the measurement basis reflects current expectations about those future amounts.

Depreciation, Impairment and Other Adjustments

46. Depreciation and impairment are applicable to measurement bases in the historical cost model and the current value model. Neither depreciation nor impairment are measurement bases or measurement techniques in their own right. They are methods to reflect the consumption of the asset or loss of the future economic benefits or service potential of the asset.

47. Under both the historical cost model and the current value model, an asset is updated over time to depict:

    (a) The consumption of part or all of the resource that constitutes the asset (depreciation or amortization);

    (b) Payments received that extinguish part or all of the asset;

    (c) The effect of events that cause part or all of the asset to no longer be recoverable (impairment); and

    (d) Accrual of interest to reflect any financing component of the asset.

48. Under both the historical cost model and the current value model, a liability is updated over time to depict:

    (a) Fulfillment of part or all of the liability, for example, by making payments that extinguish part or all of the liability or by satisfying an obligation to deliver goods or services;

    (b) The effect of events that increase the value of the obligation to transfer the resources needed to fulfill the liability to such an extent that the liability becomes onerous. A liability is onerous if the carrying amount is no longer sufficient to depict the obligation to fulfill the liability; and

    (c) Accrual of interest to reflect any financing component of the liability.

Transaction Costs in Subsequent Measurement

49. **Transaction costs are incremental costs that would not have been incurred if the entity had not acquired, constructed, developed or disposed of the asset or incurred, transferred, or settled the liability.**

50. Incremental costs are a direct result of the transaction. Transaction costs are an essential feature of the transaction, and they would not have been incurred had the transaction not occurred. For example, while costs to operate an asset after it has been acquired are incremental costs because they would not be incurred if the entity had not acquired the asset, these costs are not transaction costs, as they are not a direct result of the transaction.

51. Costs attributable to the acquisition, construction, or development, of an asset relate specifically to costs of transfer of control. Costs incurred prior to transfer (e.g., costs to negotiate the transaction), or costs incurred subsequent to the transfer (e.g., borrowing costs), are excluded from the definition of transaction costs.

52. Including transaction costs in the measurement of an asset or liability is dependent on the objective of measurement. Whether an entity is recognizing an asset or liability using an entry-based measurement basis or an exit-based measurement basis impacts whether those transaction costs are included in, or excluded from, the item’s measurement.

53. Transaction costs can arise when an asset is acquired, constructed, or developed or a liability is assumed, when an asset is disposed of or a liability is settled or transferred. As transaction costs incurred in acquiring, constructing, or developing an asset or assuming a liability are a feature of the transaction in which the asset

was acquired, constructed or developed, or the lability was assumed, such transaction costs incurred in entering into a transaction are included in entry-based measurement bases. Transaction costs that would be incurred in disposing of an asset or in settling or transferring a liability are a future or a possible future transaction. As such, transaction costs that would be incurred in exiting a transaction are included in exit-based measurement bases when the measurement basis is entity-specific.

Disclosure

54. An entity shall disclose information that helps users of its financial statements assess the measurement basis, the measurement techniques and inputs used to develop those measurements.

55. To meet the objectives in paragraph 54, an entity shall apply the measurement disclosure requirements in the relevant IPSAS to which the measurement of the asset or liability applies.

Effective Date and Transition

Effective Date

56. **An entity shall apply this Standard for annual periods beginning on or after January 1, 2025. Earlier application is permitted. If an entity applies this Standard earlier, it must disclose that fact.**

56A. **Paragraphs 23, B4–B6, and B9 are amended by Part 1 of *Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement*, issued in August 2025. An entity shall apply these amendments prospectively for annual financial statements covering periods beginning on or after January 1, 2028. Earlier application is permitted. If an entity applies these amendments for an earlier period, it shall disclose that fact.**

56B. **Paragraph 4(c) is amended by Part 2 of *Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement* issued in August 2025. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2028. Earlier application is permitted. If an entity applies these amendments for an earlier period, it shall disclose that fact.**

56C. **Paragraph B13 is amended by Part 3 of *Amendments to IPSAS Standards as a Result of the Application of IPSAS 46, Measurement*, issued in August 2025. An entity shall apply these amendments for annual financial statements covering periods beginning on or after January 1, 2028. Earlier application is permitted.**

57. When an entity adopts accrual basis IPSAS Standards as defined in IPSAS 33 for financial reporting purposes subsequent to this effective date, this Standard applies to the entity's annual financial statements covering periods beginning on or after the date of adoption of accrual basis IPSAS Standards.

Transition

58. This Standard shall be applied prospectively as of the beginning of the annual period in which it is initially applied.

Appendix A

Historical Cost

This Appendix is an integral part of IPSAS 46.

Measurement

A1. The objective of the historical cost measurement basis is to provide monetary information about assets, liabilities and related revenue and expenses, using information derived, at least in part, from the price of the transaction (or deemed cost, where applicable) or other event that gave rise to them.

A2. The historical cost basis is:

(a) The consideration given to acquire, construct and/or develop an asset plus transaction costs;

(b) The consideration received to assume a liability minus transaction costs; or

(c) The deemed cost of the asset or liability or other event that gave rise to it.

The consideration is the cash or cash equivalents or the value of the other consideration given or received at the time, or period over which, the asset is acquired, constructed, or developed or the liability is assumed.

Initial Measurement

A3. Initial measurement is determined in accordance with paragraphs 7–16 of this Standard.

Subsequent Measurement

A4. After initial measurement, the gross carrying amount of an asset or liability measured using the historical cost basis remains unaffected by changes in the underlying current market conditions, unless those changes trigger an impairment. For example, the amount at which an item of property, plant, and equipment is recorded is not updated to reflect an increase in the current market price of the item after it has been acquired, constructed, or developed.

A5. However, as with current value measurements, the carrying amount of an asset or liability measured using the historical cost basis is updated to reflect changes to the item as noted in paragraphs 47 and 48.

Amortized Cost

A6. The historical cost basis is applied to financial instruments by measuring the instruments at amortized cost. Amortized cost reflects estimates of future cash flows, discounted at a rate determined at initial measurement. The amortized cost of a financial asset or financial liability is updated over time to depict subsequent changes, such as the accrual of interest, the impairment of a financial asset or payments.

Appendix B

Current Operational Value

This Appendix is an integral part of IPSAS 46.

Measurement

B1. The objective of a current operational value measurement is to estimate the amount an entity would pay for a non-financial asset at the measurement date. A current operational value measurement requires an entity to determine all of the following:

(a) The amount the entity would pay. This includes assessing the price that would be paid in an active market, or the cost the entity would incur, for the asset in the least costly manner.

(b) The remaining service potential of the asset. This considers the current condition of the asset.

(c) The asset (consistent with its unit of account). This includes assessing the asset's existing use and location.

(d) The measurement technique(s) appropriate for estimating (a) to (c) considering the availability of data that faithfully represents the assumptions that are specific to the entity.

B2. Current operational value provides an entity specific measurement of an asset held for its operational capacity in its existing use, location, and current condition.

(a) In the statement of financial position, current operational value reflects the amount an entity would pay at the measurement date for the remaining service potential of its existing asset.

(b) In the statement of financial performance, current operational value reflects the consumption of the asset in providing the service based on conditions at the measurement date. This differs from the historical cost basis which reflects consumption of the asset based on the prices when the asset was acquired, constructed, or developed, and initially recognized.

The Amount an Entity would Pay

B3. Current operational value is the amount that an entity would pay for the remaining service potential of an asset in the least costly manner based on conditions at the measurement date regardless of whether that price is directly observable or not.

B4. The amount an entity would pay is:

(a) The price to acquire the identical, or a similar, asset; or

(b) The costs that would be incurred to develop or produce the identical, or a similar, asset.

B5. The price to acquire the identical asset is the amount an entity would pay for the asset in an active market. If an active market for the identical asset does not exist an entity will need to estimate current operational value using appropriate measurement techniques.

B6. The costs that would be incurred to develop, or produce the identical, or a similar, asset is estimated using available price information. For example, many military assets, such as an aircraft, generally do not have active markets. Such assets often cannot be acquired as a finished product that is identical, or similar, to the aircraft under valuation. Measuring the cost of each part of the asset, such as the fuselage, engine, electronics etc., and the cost to assemble them into the same, or similar, aircraft, adjusted for the age, functionality, and condition, will generally be necessary to estimate the aircraft's current operational value.

Entry Price

B7. The current operational value of an asset represents an entry price. Any transaction costs that would be incurred in obtaining the asset are included in the current operational value measurement.

Entity-Specific Value

B8. An entity shall measure the current operational value of an asset using assumptions from the entity's perspective, based on the way the existing asset is used. Those assumptions shall reflect the economic, legal and other constraints that affect the possible uses of the asset. For example, where an entity is using an asset for a particular purpose, the entity will consider the amount it would pay for that type of asset based on its existing use and not consider the value for alternative uses for that asset.

The Least Costly Manner

B9. A current operational value measure assumes the amount an entity would pay for the remaining service potential of an asset at the measurement date is the least costly amount for the asset in an orderly transaction.

B10. An entity need not undertake an exhaustive search of all acquisition methods to identify the least costly amount, but it shall consider all information that could reasonably have been expected to be obtained and taken into account.

B11. Current operational value does not reflect the costs that might be incurred if an urgent necessity to replace the remaining service potential of an asset arose as a result of some unforeseeable event.

Observable Inputs

B12. For some assets, observable market transactions or market information might be available. For other assets, observable market transactions and market information might not be available. However, the objective of a current operational value in both cases is the same—to estimate the amount the entity would pay for the remaining service potential of the asset based on conditions at the measurement date (i.e., an *entry price* at the measurement date from the perspective of the entity that holds the asset).

B13. When a price for an identical, or similar, asset is not observable, an entity measures current operational value using another measurement technique that uses observable inputs, where feasible, such as when external resources are available and can be used.

B14. Because current operational value is an entity-specific value, it is measured using the assumptions from the entity's perspective. These entity-specific assumptions may result from information that is not available publicly. For example, the cost to construct an asset may include labor costs of employees of the entity, as opposed to contract workers. As a result, an entity's intention in how costs are incurred to construct an asset is relevant when measuring current operational value.

B15. In practice, there may be little difference between the assumptions that market participants would use and those that an entity itself uses. For example, where the amount that would be paid for a non-specialized asset is generally the same regardless of its existing use, the assumptions a market participant would use would be consistent with those in an entity-specific valuation.

Remaining Service Potential

B16. Current operational value is the amount the entity would pay for the remaining service potential of an asset. The remaining service potential of the asset takes into account the current age, functionality, and condition of the asset held by the entity.

B17. In order to reflect the current age, functionality, and condition, the following factors are considered:

(a) Physical obsolescence relates to any loss of service potential due to the physical deterioration of the asset or its components resulting from its age and use.

(b) Functional obsolescence relates to any loss of service potential resulting from inefficiencies in the asset that is being valued compared with its modern equivalent.

(c) Economic obsolescence relates to any loss of utility caused by economic or other factors outside the control of the entity.

The Asset

B18. Current operational value is the amount the entity would pay for the remaining service potential of a specific asset. The following key aspects affect the measurement of an asset's current operational value:

(a) The existing asset;

(b) The existing use of the asset; and

(c) The existing location of the asset.

Existing Asset

B19. Current operational value assumes the entity will continue to deliver goods and/or services by using the identical, or a similar, asset.

B20. The identical, or a similar, asset delivers goods and/or services in the same manner as the asset being measured. For example, a power authority that delivers electricity measures the amount it would pay for the remaining service potential of its generation facilities based on the nature of its existing facilities. If the generation facilities are solar farms, the amount an entity would pay for the remaining service potential of the asset is based on a solar farm as opposed to an alternative asset, such as a wind farm, that could also deliver the service.

Existing Use of the Asset

B21. Current operational value is the amount the entity would pay for the remaining service potential of an asset based on its existing use. 'Existing use' is the way an asset, or group of assets, is used and generally reflects the policy objectives of the entity operating the asset. For example, a ministry of health is responsible for the wellbeing of citizens. Assets such as buildings are used as hospitals to deliver health care services rather than for commercial purposes.

B22. Measuring the existing use of an asset disregards potential alternative uses and any other characteristics of the asset that could maximize its market value. For example, the existing use of a building operated as a school, is for the delivery of educational services. Alternative uses, such as the operation of the building as an office block held for rental at market rates are not considered. The existing use may be, but is not necessarily, the highest and best use.

B23. Any unused portion of the asset in its existing use is evaluated to determine whether the unused portion is held for a specific operational purpose associated with the asset. This may occur when an asset has security requirements, legal or other restrictions, and/or functional limitations. Unused portions based on the existing use of the asset, which are held for a specific operational purpose associated with the asset and would be replaced, are included in measuring the asset's current operational value.

B24. Where an unused portion of an asset has no specific operational purpose associated with the asset, an entity determines whether it has an alternative use. Where an alternative use is currently available, the portion of the asset is valued as a separate asset using an appropriate measurement basis. Where the unused portion of an asset has no alternative use, it is included in the current operational value, but has no value.

Existing Location of the Asset

B25. The asset's current operational value assumes that the entity will continue to deliver goods and/or services from the same location in which the asset is currently situated or used.

B26. The current operational value of an asset that cannot be physically moved reflects the value of the physically immovable asset in its existing location. For example, a hospital operating in a city center that could be situated in the suburbs, due to the migration of the population, is measured based on the amount an entity would pay for the hospital at its existing location (e.g., the amount required for a building includes construction costs, permits, regulations, etc. based on costs that would be paid at the existing location).

B27. The current operational value of a physically movable asset reflects the location from which the entity uses the asset and/or the market the entity has access to. For example, the furniture and equipment in a hospital operating in a city center is measured based on the amount an entity would pay for furniture and equipment for the hospital at its current city center location.

Measurement Techniques

B28. The objective of using a measurement technique is to estimate the amount an entity would pay for the remaining service potential of an asset based on conditions at the measurement date. The widely used measurement techniques are the market approach and the cost approach. The main aspects of those approaches are summarized in paragraphs B32–B36. An entity shall use measurement techniques consistent with one or other of those approaches to measure the current operational value.

B29. An entity uses measurement techniques that are appropriate in the circumstances and for which sufficient data are available to measure current operational value, using observable inputs, where feasible.

B30. In some cases, current operational value cannot be determined directly by observing prices in an active market and must be determined by other means. For example, if prices are available only for new assets, the current operational value of a used asset might need to be estimated by adjusting the current price of a new asset to reflect the current age, functionality, and condition of the asset held by the entity.

B31. If multiple measurement techniques are used to measure current operational value, the results shall be evaluated considering the reasonableness of the range of values indicated by those results. A current operational value measurement is the point within that range that is the most representative value of the remaining service potential of the asset in the circumstances.

Market Approach

B32. Applying the market approach to measure the current operational value of an asset requires the existence of an active market with transactions involving identical or similar assets.

B33. The market approach uses an asset price from an orderly transaction in the principal market (or the market that minimizes the amount that would be paid to acquire the asset) for the entity at the measurement date.

B34. Identical or similar assets include the same characteristics as the asset being measured. When measuring the current operational value of an asset using the market approach an asset with an identical or similar remaining useful life, service potential, etc. must be identified.

Cost Approach

B35. The current operational value of an asset should be established using the cost approach when no active market for similar or identical assets exists. The more specialized the asset, the less likely an active market exists and the more likely the cost approach will need to be applied.

B36. When the existence of market transactions involving identical or similar assets does not exist, current operational value is the cost to develop or produce the identical, or a similar, asset.

Modern Equivalent Asset

B37. When no cost information is available for a similar or identical asset, or when the existing asset would not be replaced with an identical asset, an entity may estimate current operational value by calculating the cost of a modern equivalent asset and then making deductions for obsolescence and optimization. It may be necessary, therefore, to estimate the current operational value of an asset by drawing on the current price of a modern equivalent asset that provides an equivalent service as the existing asset in its existing use, adjusted to reflect the current age, condition and functionality of the asset held by the entity.

B38. Applying the cost approach means current operational value cannot be determined by observing prices in an active market. However, measuring the current operational value using the cost approach continues to require the use of relevant observable inputs for parts of the asset, where the entity would acquire those parts from the market.

Appendix C

Cost of Fulfillment

This Appendix is an integral part of IPSAS 46.

Measurement

C1. The objective of the cost of fulfillment measurement is to estimate the value of a liability assuming the entity will fulfill the liability in the least costly manner. A cost of fulfillment measurement requires an entity to determine all the following:

(a) The particular liability that is the subject of the measurement (consistently with its unit of account).

(b) The manner in which the liability will be settled.

The Least Costly Manner

C2. The cost of fulfillment assumes that the liability is settled by the entity in the least costly manner.

C3. The cost of fulfillment represents the amount the entity is obligated to incur to settle the liability. This liability represents the minimum amount an entity will incur assuming the entity completely satisfies the liability. For example, an entity may have a liability to restore a parcel of land to its original condition when a temporary road is no longer in use. Even when the entity intends to enhance the parcel of land, the costs of enhancements are beyond the cost to fulfill the minimum liability of restoring the land to its original condition and therefore are not representative of the cost to fulfill the liability. In cases where an entity intends to fulfill the liability beyond its commitment, guidance in IPSAS 19, Provisions, Contingent Liabilities and Contingent Assets, should be applied when accounting for an amount in excess of the cost to fulfill.

C4. The entity must have the ability to access the fulfillment method that results in the liability being settled in the least costly manner at the expected fulfillment date. Because different entities (and operations within those entities) with different activities may have access to a variety of fulfillment methods, the least costly manner for the same liability might be different for different entities (and operations within those entities). Therefore, the least costly manner shall be considered from the perspective of the entity, thereby allowing for differences between and among entities with different activities and circumstances.

C5. An entity need not undertake an exhaustive search of all fulfillment methods to identify the least costly manner of fulfillment, but it shall take into account all information that is reasonably available. In the absence of evidence to the contrary, the least costly manner of fulfillment is presumed to be the manner in which the entity has currently selected to release itself from the liability. For example, if an entity elects to fulfill its decommissioning liability using its own employees, it is presumed this is the least costly manner of fulfillment, regardless of the entity's ability to contract the decommissioning to third parties.

C6. Where fulfillment requires work to be done—for example, where the liability is to rectify environmental damage—the relevant costs are those that the entity will incur. This may be the cost to the entity of doing the remedial work itself, or of contracting with an external party to carry out the work. However, the costs of contracting with an external party are only relevant where employing a contractor is the least costly means of fulfilling the liability and the entity has the ability to access the fulfillment method (see paragraph C4).

C7. Where fulfillment will be made by the entity itself, the cost of fulfillment does not include any margin above costs, because any such margin above costs does not represent a use of the entity's resources. Where the cost of fulfillment amount is based on the cost of employing a contractor, the amount will implicitly include the profit required by the contractor, as the total amount charged by the contractor will be a claim on the entity's resources.

Entity-Specific Value

C8. The cost of fulfillment is an entity-specific value. An entity shall measure the cost of fulfillment of a liability using the assumptions from the entity's perspective, assuming the entity acts in accordance with its objectives.

C9. In developing those entity-specific assumptions, an entity shall identify characteristics specific to the entity and the liability, considering factors specific to all the following:

(a) The liability;

(b) The entity's expectations about the amount and timing of future outflows of resources; and

(c) The time value of money.

Whether a risk premium is included in the calculation will depend on guidance in the relevant IPSAS.[2]

C10. When estimating assumptions, such as the time value of money, there may be little difference between the assumptions that a market participant would apply and those an entity uses itself.

The Cost that the Entity Will Incur

C11. The cost of fulfillment estimates the cost assuming the entity settles the liability.

C12. A cost of fulfillment measurement, both at initial and subsequent measurement, should only incorporate the future outflows of resources the entity expects to incur to satisfy the liability. Those future outflows of resources include the amounts:

(a) To be transferred to the liability counterparty; and

(b) The entity expects to be obliged to transfer to other parties to settle the liability.

C13. The price used to measure the cost of fulfilling the liability shall not be adjusted for transaction costs incurred to enter into the transaction. Entry-based transaction costs have no impact on the future outflows of resources the entity expects to incur. In contrast, transaction costs that are expected to be incurred in settling the liability, i.e., exit-based, are a future outflow of resources that is relevant in measuring the cost to fulfill the liability and are included in measuring the cost of fulfillment.

C14. Where the cost of fulfillment depends on uncertain future events, all possible outcomes are taken into account in the estimated cost of fulfillment, which aims to reflect all those possible outcomes in an unbiased manner.

C15. Where fulfillment of the liability will not take place for an extended period, the cash flows need to be discounted to reflect the value of the liability at the measurement date using the income approach. As a practical expedient, an entity need not discount the value of the future outflow of resources if the entity expects the liability to be settled within one year.

Settling the Liability

C16. The cost of fulfillment is the cost that the entity expects to incur to settle its liability in the normal course of operations.

C17. In estimating the cost to settle its liability in the normal course of operations, the entity assumes the liability will be fulfilled under the existing terms of the arrangement and that the liability will not be transferred to a third party.

[2] When including a risk premium in measuring cost of fulfillment, an entity should perform the measurement from the perspective of the entity holding the liability rather than from the perspective of the market participant as noted in paragraph D8.
